(1) reacting a multifunctional organic silicon compound of the formula $RSiX_3$, with silica or alumina or a mixture thereof having surface hydroxyl groups, where R is a hydrocarbon group or hydrocarbon derivative group and X is a group chemically reactive with said surface hydroxyl groups selected from the group consisting of $—OR^1$, $—N(R^1)_2$, $—N(H)SiR_3^1$, $—OCH_2CH_2OR^1$, $—O_2CR^1$, or mixtures, where R^1 is a hydrocarbon group or hydrocarbon derivative group;

(2) reacting the product of step (1) with a halide or alkoxide of titanium, vanadium or zirconium or mixture of these; and

(3) reacting the product of step (2) with an organomagnesium compound or complex; or

(2') reacting the product of step (1) with an organomagnesium compound or complex; and

(3') reacting the product of step (2') with a halide or alkoxide of titanium, vanadium or zirconium or mixture of these.

PREPARATION OF HOMOPOLYMERS AND COPOLYMERS OF PROPENE BY MEANS OF A ZIEGLER-NATTA CATALYST SYSTEM

Ralf Zolk, 7 Weinbietstrasse, 6714 Weisenheim; Juergen Kerth, 15 Wattenheimer Strasse, 6719 Carlsberg, and Rainer Hemmerich, 9 Veilchenweg, 6718 Gruenstadt, all of Fed. Rep. of Germany

Filed Aug. 30, 1989, Ser. No. 400,350

Claims priority, application Fed. Rep. of Germany, Aug. 31, 1988, 3829519

The portion of the term of this patent subsequent to Aug. 15, 2006, has been disclaimed.

Int. Cl.[5] C08F *4/648, 4/654, 4/656*

U.S. Cl. 526—128 **3 Claims**

1. A process for preparing a homopolymer of propene or a copolymer of propene with a minor amount of another C_2-C_{12}-α-monoolefin by polymerization of the monomer(s) at from 20° to 160° C. under from 1 to 100 bar by means of a Ziegler-Natta catalyst system composed of

(1) a titanium component based on a finely divided shape-dictating silica gel and containing titanium, magnesium, chlorine and a benzenecarboxylic acid derivative,

(2) an aluminum component of the formula

$$AlR_3$$

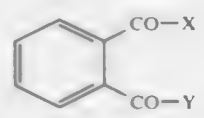
where

R is alkyl of not more than 8 carbon atoms, and

(3) a silane component of the formula

$$R_n^1Si(OR^2)_{4-n}$$

where



R^1 is saturated aliphatic or aromatic hydrocarbyl of not more than 16 carbon atoms,

R^2 is alkyl of not more than 15 carbon atoms, and

n is from 0 to 3,

with the provisos that the atomic ratio of titanium of titanium component (1) : aluminum of aluminum component (2) is from 1:10 to 1:800 and the molar ratio of aluminum component (2) : silane component (3) is from 1:0.01 to 1:0.8, which comprises using as the titanium component (1) a titanium component obtained by first of all

(1.1) preparing in a first stage (I) a carrier material from (Ia) a finely divided silica gel having a particle diameter of from 1 to 1,000 μm, a pore volume of from 0.3 to 5 cm^3/g, a surface area of from 100 to 1,000 m^2/g, and the formula $SiO_2.aAl_2O_3$, where a is from 0 to 2, (Ib) an organomagnesium compound of the formula MgR^3R^4, where R^3 and R^4 are each C_2–C_{10}-alkyl, (Ic) a gaseous chlorinating agent of the formula ClZ, where Z is Cl or H, and (Id) a phthalic acid derivative of the formula

where X and Y together are oxygen or singly chlorine or C_1-C_{10}-alkoxy, by first

(1.1.1) bringing together in a first substage in a liquid inert hydrocarbon with constant mixing at room temperature the finely divided silica gel (Ia) and the organomagnesium compound (Ib) by using per 10 molar parts of silicon of silica gel (Ia) from 1 to 10 molar parts of the organomagnesium compound (Ib), and keeping the mixture at from 20 ° to 140° C. for from 0.5 to 5 hours, then

(1.1.2) introducing into the product obtained from the first substage in a second substage with constant mixing at from −20° to +80° C., (i) the gaseous chlorinating agent (Ic) using from 2 to 40 molar parts of chlorinating agent (Ic) per molar part of organomagnesium compound (Ib), and (ii) the phthalic acid derivative (Id) using per molar part of organomagnesium compound (Ib) from 0.01 to 1 molar parts of phthalic acid derivative (Id) leaving the whole mixture at a temperature within the stated range for from 0.5 to 5 hours and,

(1.2) preparing in a second stage a solid-phase intermediate from (I) the carrier material obtained in the first stage, (II) a C_1-C_8-alkanol and (III) titanium tetrachloride by first

(1.2.1) bringing together in a first substage in a liquid inert hydrocarbon with constant mixing at room temperature the carrier material (I) and the alkanol (II) using from 1 to 5 molar parts of alkanol (II) per molar part of magnesium of carrier material (I), and keeping the mixture at from 20° to 140° C. for from 0.5 to 5 hours, then

(1.2.2) in a second substage introducing the titanium tetrachloride (III) with constant mixing at room temperature into the reaction mixture resulting from the first substage using from 2 to 20 molar parts of titanium tetrachloride (III) per molar part of magnesium of carrier material (I), keeping the mixture at from 10° to 150° C. for from 0.5 to 5 hours and isolating the resulting solid-phase intermediate by removing the liquid phase, then

(1.3) in a third stage subjecting the solid-phase intermediate obtained from the second stage at from 100° to 150° C. for from 0.2 to 8 hours to a single- or multi-stage or continuous extraction with titanium tetrachloride or a mixture of titanium tetrachloride and an ethylbenzene whose titanium tetrachloride content is not less than 2%, using for every 10 parts by weight of the solid-phase intermediate obtained from the second stage a total of from 10 to 1,000 parts by weight of extractant, and finally

(1.4) in a fourth stage washing the solid-phase product formed in the third stage one or more times with a liquid inert hydrocarbon and so obtaining titanium component (1).

CO-POLYMERS OF LONG CHAIN ALKYL ACRYLATES WITH N-CONTAINING OLEFINS AND THEIR USE AS FLOW IMPROVERS FOR CRUDE OILS

Bernd Wahle, Kaarst; Claus-Peter Herold, Mettmann; Wolfgang Zoellner, Duesseldorf; Ludwig Schieferstein, Ratingen, and Doris Oberkobusch, Duesseldorf, all of Fed. Rep. of Germany, assignors to Henkel Kommanditgesellschaft auf Aktien, Duesseldorf, Fed. Rep. of Germany

Filed Mar. 21, 1989, Ser. No. 326,598

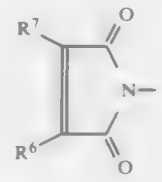
Claims priority, application Fed. Rep. of Germany, Mar. 21, 1988, 3809418

Int. Cl.[5] C08F *22/40*

U.S. Cl. 526—262 **15 Claims**

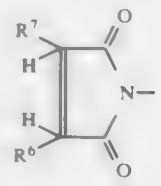
1. A copolymer comprising units of:

(1) an acrylate of the formula I



$$CH_2=CR^1—CO—OR^2 \quad (I)$$

wherein R^1 is hydrogen or methyl, and R^2 is a linear or branched, saturated or unsaturated aliphatic radical having from 16 to 34 carbon atoms, and

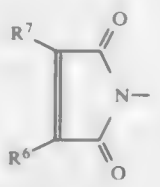


(2) N-containing olefins selected from the group consisting of (A) a compound of the formula II

$$R^3—R^4—O—CO—CR^5=CH_2 \quad (II)$$

wherein R^3 is a cyclic imide having of the formula III or IV

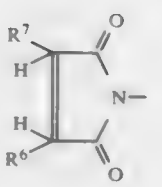
(III)



(IV)

wherein R^5 is hydrogen or methyl, R^6 and R^7 are together or separately hydrogen or C_1–C_4-alkyl groups or when taken together are ring fragments of an unsubstituted or a C_1–C_4 alkyl substituted ring having 5 or 6 carbon atoms, R^4 is (a) a straight-chain or branched alkylene group having 1 to 12 carbon atoms optionally sustituted with —OH or $—NH_2$ group, (b) a straight-chain or branched group having 1 to 12 carbon atoms containing the $—CH_2—CH_2—O—CH_2—CH_2-$ or $—CH_2—CH_2—NH—CH_2—CH_2-$ moiety when the alkylene group contains at least 4 carbon atoms, (c) a cyclic C_5- or C_6-alkylene group or (d) a C_1–C_4-alkylene- substituted phenylene group,

(B) a compound of formula V

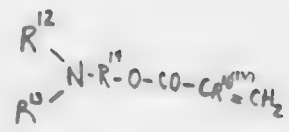


$$R^3—R^8—CO—OR^9—O—CO—CR^{10}=CH_2 \quad V$$

wherein R^3 is a cyclic imide having of the formula III or IV

(III)

-continued



(IV)

wherein R^6 and R^7 are together or separately hydrogen or C_1–C_4-alkyl groups or when taken together are ring fragments of an unsubstituted or a C_1–C_4 alkyl substituted ring having 5 or 6 carbon atoms, R^9 is C_2–C_{10} alkylene group, R^{10} is hydrogen or methyl, R^8 is a phenylene radical or an alkylene group of the formula

wherein R^{20} is a hydrogen atom or a branched alkyl radical having from 1 to 11 carbon atoms, and R^9 is a C_2–C_{10}-alkylene group,

(C) a compound of formula VI

(IV)

wherein R^{16} is hydrogen or methyl, R^{12} is a phenyl or benzyl group, R^{13} is a C_1–C_{16}-alkyl group and R^{16} is a C_2–C_6-alkylene group,

(D) a compound of formula VII

$$R^{17}—CO—NH—R^{18}O—CO—CR^{19}=CH_2 \quad (VII)$$

wherein R^{19} is hydrogen or methyl, R^{17} is C_7-C_{33}-alkyl group, R^{18} is a C_2–C_4-alkylene group or combinations thereof in molar ratios of I, to II, V, VI or VII of from about 1:0.1 to about 1:10.

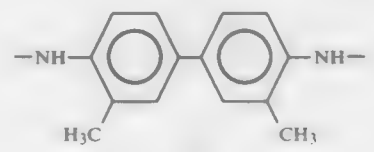
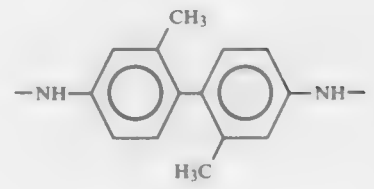
1. A wholly aromatic polyamide copolymer comprising:

an aromatic dicarbonyl moiety consisting of repeating units of the formula:



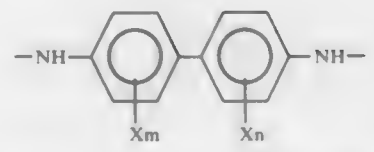
and



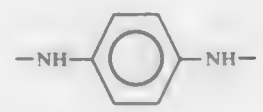
an aromatic diamine moiety comprising:

(A) at least one repeating unit selected from the group consisting of (A-1), (A-2) and (A-3), of the formulae:

(A-1)

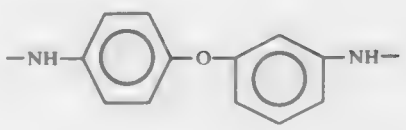


(A-2)



and

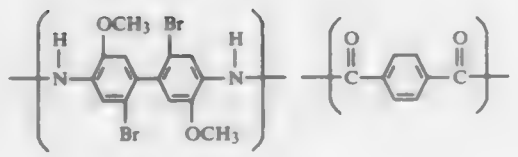
(A-3)



wherein X represents a halogen atom, m and n represent, respectively and independent from each other, zero or an integer of 1 to 4, wherein the sum of m and n is 1 to 8.

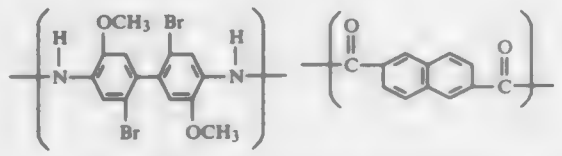
and

(C) repeating units of the formula:



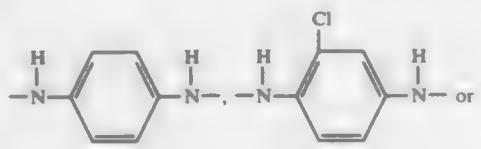
5,006,630

SOLUBLE AMORPHOUS PARA-ORIENTED AROMATIC POLYAMIDE FROM 2,2'-DIBROMO-5,5'-DIMETHOXY-[1,1'-BIPHENYL]-4,4'-DIAMINE

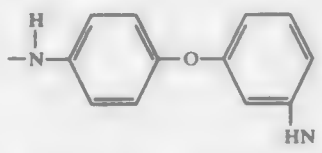


Robert S. Irwin, Wilmington, Del., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Filed Jun. 30, 1989, Ser. No. 374,688
Int. Cl.[5] C08G *69/32*
U.S. Cl. 528—185 **5 Claims**



1. Amorphous para-oriented aromatic copolyamide consisting essentially of units of the formula



or

or copolyamide thereof in which u to 92.5 mol % of the diamino moiety is replaced by

said polymer having an inherent viscosity, ηinh, of at least 1.0, where

$$\eta inh = \frac{\ln(\eta rel)}{C}$$

where ηrel is the relative viscosity measured at 30° C. and C is the concentration in grams of polymer per deciliter of sulfuric acid.

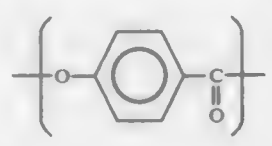
5,006,631

AROMATIC POLYESTER CARBONATE FROM DIPHENOL MIXTURE

Masanao Kawabe, Tokyo; Masao Kimura, Kawasaki; Kazuhiro Sugiyama, Tokyo; Ikuro Yamaoka, Kawasaki, and Hiroharu Inoue, Tokyo, all of Japan, assignors to Nippon Steel Corporation and Nippon Steel Chemical Co., Ltd., both of Tokyo, Japan

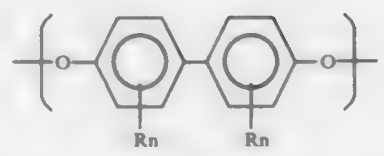
Filed Jul. 19, 1989, Ser. No. 383,155

Claims priority, application Japan, Jul. 20, 1988, 63-179146; Sep. 27, 1988, 63-239863; Apr. 21, 1989, 1-100132; Apr. 21, 1989, 1-100133



Int. Cl.[5] C08G *63/64*

U.S. Cl. 528—204 **12 Claims**



1. An aromatic polyester carbonate comprising structural units represented by the following formulae (A), (B), (C), and (D) and satisfying the following relationship when the mole fractions of the structural units represented by the formulae (A), (B), (C), and (D) are defined as a, b, c, and d, respectively:

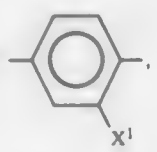
$$0 \leq \frac{d}{a+b} \leq 0.50$$

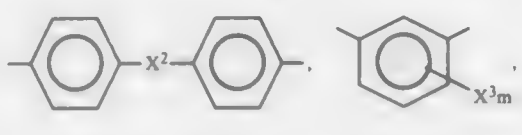
and having an inherent viscosity [η_{inh}] in a solution at a concentration of 0.5 g/dl in p-chlorophenol as a solvent at 50° C. of 1.0 dl/g or higher, or being insoluble in the solvent, and having liquid crystal properties:

(A)

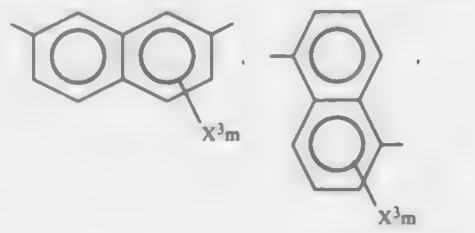
(B)

wherein R is the same or different and represent an alkyl, phenyl group or a halogen, and n represents an integer of 0 to 4;

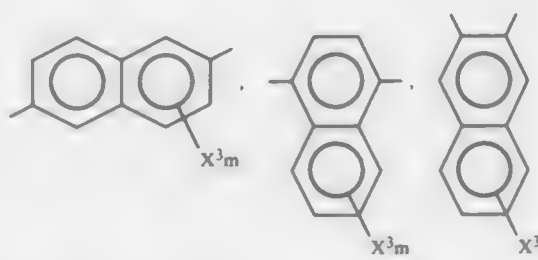




(C)



and



(D)

wherein Ar represents  ,

X^1 represents a substituted or non-substituted phenyl group, an alkyl group having 3 to 6 carbon atoms or a halogen;

X^2 represents —O—, —S—,

or —CH_2—;

X^3 is the same or different and represents an alkyl group, phenyl group, or a halogen; and

m represents an integer of 0 to 4.

5,006,632

PROCESS FOR PREPARING HEAT RESISTING HYDROBENZOIC ACID SERIES POLYESTERS WITH HIGH DEGREE OF POLYMERIZATION

Renxian Duan, Chengdu; Chengjiu Peng, Fushun, and Guijiang Tian, Beijing, all of China, assignors to The First Branch of Chengnang Research Institute of Chemical Industry, Sichuan, China

Filed Nov. 3, 1989, Ser. No. 431,551

Claims priority, application China, Nov. 5, 1988, 88109743.8

Int. Cl.[5] C08G *63/06, 65/38*

U.S. Cl. 528—206 **8 Claims**

1. A process for preparing hydroxybenzoic acid polyester resins with a high degree of heat resistance and a high degree of polymerization comprising the steps of

preparing phenyl hydroxybenzoate monomer by esterifying hydroxybenzoic acid with phenol, the mole ratio of phenol to hydroxybenzoic acid being greater than one to ensure an excess amount of phenol.

said esterification being conducted at a temperature from about 120°-250° C. for a period of about 1-10 hours in the presence of an esterification catalyst present in an amount of about 0.0001-0.1% based upon total weight of reactants, said catalyst being selected from the group consisting of sulfuric acid, sulfonic acid derivatives, or mixtures thereof;

distilling the reaction mixture to remove phenol and water;

discarding the water;

polymerizing said monomer by a polycondensation reaction to form said polyester resin,

said polycondensation reaction being conducted in the presence of (a) a polycondensation catalyst in the amount of about 0.0001-0.01 mole % per mole of hydroxybenzoic acid selected from the group consisting of butyltitanate, phenyltitante, organo-tin compounds or their derivatives, or mixtures thereof, and (b) a polycondensation solvent in the amount of about 100-1000 ml per mole of hydroxybenzoic acid selected from the group consisting of polychlorobiphenyl, hydroxypolydiphenyl, mixtures of polybenzyl or benzyl-substituted alkylbenzenes, polyarylethers, or mixtures thereof at a temperature no higher than about 330°-430° C. which is reached by raising the reaction temperature at a rate of about 0.1°-10° C./min.;

distilling off the phenol generated as a by-product of said polycondensation reaction and combining it with the phenol distillates collected after the esterification reaction; and

combining all the phenol distillates with additional hydroxybenzoic acid to prepare additional monomer for further polycondensation reaction to produce polyester.

5,006,633

NOVEL COMPOLYMERS AND ELECTROACTIVE POLYMERS DERIVED THEREFROM

Yutaka Shikatani; Naoki Katsuka; Yoshiyuki Shimo; Nobuyuki Kuroda, all of Kanagawa, and Kazuo Matsuura, Tokyo, all of Japan, assignors to Nippon Oil Company, Limited, Tokyo, Japan

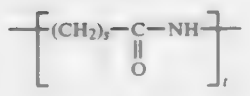
MOLECULAR WEIGHT CONTROLLER COMPOSITION FOR AQUEOUS POLYMERIZATION OF LACTAM TO POLYAMIDE



Jack A. Dellinger, Weaverville, N.C., assignor to BASF Corporation, Williamsburg, Va.

Division of Ser. No. 294,959, Jan. 6, 1989, Pat. No. 4,844,834. This application May 31, 1989, Ser. No. 359,445

Int. Cl.[5] C08G *69/16*

U.S. Cl. 528—315 **15 Claims**

1. A process of polymerizing lactams to produce a polyamide having recurring units of the formula

wherein

s is a positive integer and has a value from 3 to 11; and

t is a positive integer and represents the number of monomer units in the polymer required to achieve the desired molecular weight;

comprising:

adding to said lactams an effective amount of an aqueous molecular weight controller comprising

(a) a monofunctional primary amine having a boiling point of at least 180° C. at atmospheric pressure and a basic dissociation constant of at least 1.7×10^{-5};

(b) a monofunctional organic acid having an acid dissociation constant of at least 1.5×10^{-5}; and,

(c) an aminoacid containing a cyclic structure of 5 or 6 carbon atoms, a total number of carbon atoms in the range of from about 6 to 9, and having its amino group salified by a salifying monofunctional acid having an acid dissociation constant of at least 1.0×10^{-2}

wherein the polymerization is carried out at a temperature in the range of from about 200 to 280° C.

5,006,636

PROCESS FOR THE PRODUCTION OF SiO_2 CONTAINING POLYBENZAMIDES

Manfred Spies, Marburg, and Walter Heitz, Kirchhain, both of Fed. Rep. of Germany, assignors to Bayer Aktiengesellschaft, Leverkusen, Fed. Rep. of Germany

METHOD FOR PREPARING COPOLYESTERCARBONATES FROM CYCLIC OLIGOMERS

Thomas L. Guggenheim, Scotia; James M. Fukuyama, Clifton Park, and John J. Kelly, Troy, all of N.Y., assignors to General Electric Company, Schenectady, N.Y.

Filed Jan. 12, 1989, Ser. No. 364,387

Int. Cl.[5] C08G *63/64*

U.S. Cl. 528—355 **17 Claims**

1. A method for preparing a copolyestercarbonate which comprises contacting at least one cyclic polycarbonate oligomer with at least one cyclic polyester oligomer in the presence of a cyclic polycarbonate polymerization catalyst, at a temperature in the range of about 300°-375° C.

5,006,638

MELT PROCESSING OF CARBON MONOXIDE/OLEFIN COPOLYMER WITH CARBON DIOXIDE

Robert Q. Kluttz, Houston, Tex., assignor to Shell Oil Company, Houston, Tex.

Continuation of Ser. No. 357,227, May 26, 1989, abandoned. This application Jan. 8, 1990, Ser. No. 462,955

Int. Cl.[5] C08G *67/02*

U.S. Cl. 528—483 **18 Claims**

1. A process for improving the melt stability of a linear alternating polymer of carbon monoxide and at least one ethylenically unsaturated hydrocarbon by contacting the polymer with an atmosphere containing 0.1% to 100% carbon dioxide during at least one melt processing step, and subsequently solidifying the polymer.

5,006,639

METHOD OF COAGULATING SLUDGE

Show Tono, Tokyo; Toshiyuki Miki; Yoshihide Dairokuno, both of Kanagawa, and Jyun Katsoka, Chiba, all of Japan, assignors to Aoki Corporation, Osaka, Japan

Filed Jan. 11, 1989, Ser. No. 295,796

Claims priority, application Japan, Jun. 10, 1988, 63-142946

Int. Cl.[5] C02F *1/56*

U.S. Cl. 210—727 **2 Claims**

1. A method of coagulating sludge, which comprises sequentially adding to sludge an anionic polymer coagulant having a pH of 6–8, a cationic polymer coagulant having a pH of 3–6 and an anionic polymer coagulant, each of said polymers being added in a coagulating amount.

5,006,640

POLYKETONE WITH UNSATURATED TERMINAL GROUPS

Eit Drent, Amsterdam, Netherlands, assignor to Shell Oil Company, Houston, Tex.

Division of Ser. No. 271,130, Nov. 14, 1988, Pat. No. 4,921,938. This application Jan. 11, 1990, Ser. No. 463,706

Claims priority, application Netherlands, Nov. 12, 1987, 8702705

Int. Cl.[5] C08G *67/02*

U.S. Cl. 528—392 **7 Claims**

1. A linear alternating polymer of carbon monoxide and at least one α-olefin, the polymer comprising:

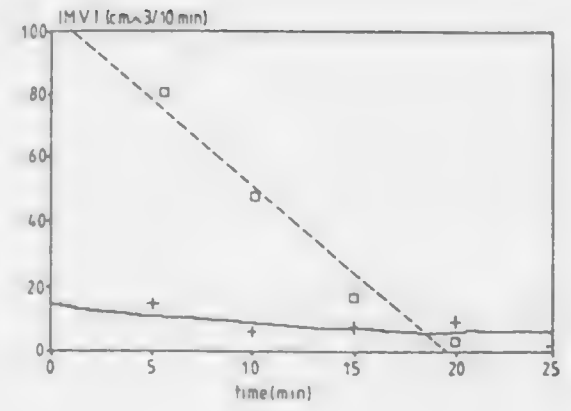
units of the formula —CO—(A)—wherein A is a mer unit from one or more α-olefins; and

a least one polymer molecule that terminates with at least one group containing a carbon-carbon double bond.

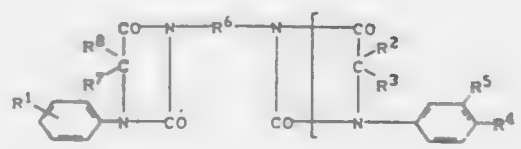
5,006,641

PROCESS FOR THE PREPARATION OF POLYHYDANTOINS WHICH CAN BE PROCESSED THERMOPLASTICALLY

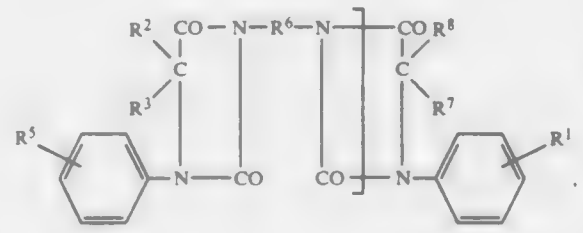
Friedrich Jonas, Aachen, and Rudolf Merten, Leverkusen, both of Fed. Rep. of Germany, assignors to Bayer Aktiengesellschaft, Leverkusen, Fed. Rep. of Germany



Filed Feb. 12, 1990, Ser. No. 478,408



Claims priority, application Fed. Rep. of Germany, Feb. 24, 1989, 3905792; Apr. 27, 1989, 3913856



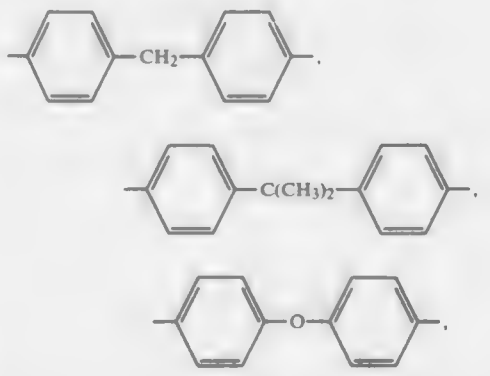
Int. Cl.[5] C08G *22/00*

U.S. Cl. 528—328 **10 Claims**

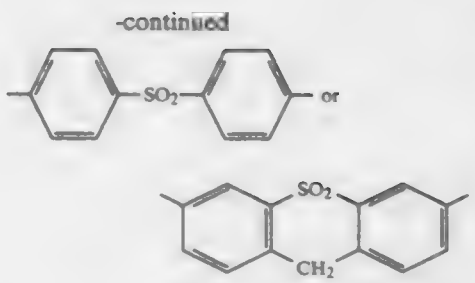
1. Process for the preparation of polyhydantoins which can be processed thermoplastically of the formula:

in which

R^1 denotes hydrogen or straight-chain or branched C_1–C_{12}-alkyl,



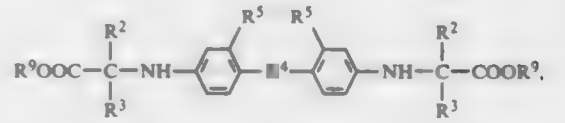
R^2 and R^3 independently of one another represent hydrogen or straight-chain or branched C_1–C_6-alkyl, or together denote



R^4 represents $—CH_2—$, $—C(CH_3)_2$, —CO—, —O— or $—SO_2—$,

R^5 denotes hydrogen, or both R^5-substituents of neighbouring rings denote ring-forming $—SO_2—$,

R^6 represents the divalent radical of a straight-chain or branched aliphatic C_2–C_{20} hydrocarbon, of a cycloaliphatic C_5–C_{10} hydrocarbon, of an aromatic C_6–C_{12} hydrocarbon or one of the groups:



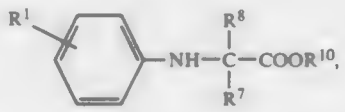
-continued

and

R^7 and R^8 independently of one another denote hydrogen or straight-chain or branched C_1–C_{12}-alkyl,

characterised in that in a first step, bis-glycine esters of the formula:

in which



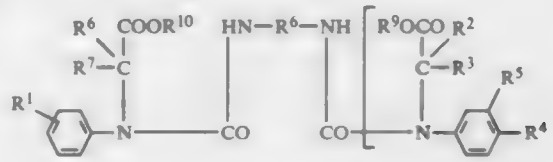
R^2 to R^5 have the above meaning, and

R^9 represents straight-chain or branched C_1–C_{10}-alkyl or C_6–C_{10}-aryl,

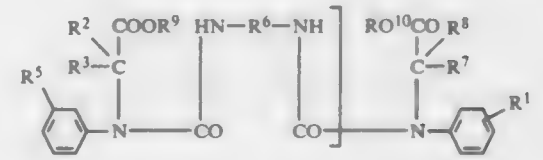
are reacted with between 1 and 2 moles of diisocyanate of the formula:

$$OCN—R^6—NCO,$$

in which R^6 has the above meaning, per mole of bis-glycine ester in a liquid reaction medium, and after forming the polyurea from the bis-glycine ester and the diisocyanate, is reacted further in a second step with an amount of monoglycine ester of the formula:



in which



R^1, R^7 and R^8 have the above meaning, and

R^{10} represents straight-chain or branched C_1–C_{10}-alkyl or C_6–C_{10}-aryl,

equivalent to the residual amount of isocyanate end groups, to give a polyurea of the formula:

(V)

in which

R^1 to R^{10} have the above meaning,

and finally, the cyclocondensation to give the polyhydantoin is carried out with removal of R^9OH and $R^{10}OH$.

5,006,642

PURIFICATION OF VON WILLEBRAND FACTOR BY AFFINITY CHROMATOGRAPHY

Jack Newman, Burke, and David L. Farb, Woodbridge, both of Va., assignors to Rhone-Poulenc Rorer Pharmaceuticals Inc., Fort Washington, Pa.

Division of Ser. No. 67,990, Jun. 29, 1987, Pat. No. 4,774,323. This application Jun. 13, 1988, Ser. No. 205,881

Int. Cl.[5] C07K *15/06, 3/18, 3/28*

U.S. Cl. 530—383 **12 Claims**

1. In a method for increasing the therapeutic activity of von Willebrand Factor wherein an essentially purified von Willebrand Factor is obtained by adsorbing a Factor VIII/von Willebrand Factor complex obtained from plasma or commercial concentrate source onto particles bound to a monoclonal or polyclonal antibody specific to von Willebrand Factor;

first eluting Factor VIII from said particles;

next eluting von Willebrand Factor from said particles by washing said particles with a 0.05 M to 5 M aqueous solution of a chaotropic agent; and

separating the von Willebrand factor from said chaotropic agent,

the improvement which comprises: incubating said essentially purified von Willebrand Factor at a temperature of 20° C. to 55° C. for 1 to 30 hours.

5,006,643

PROCESS FOR PREPARING ISOTHIOCYANATO FUNCTIONALIZED METAL COMPLEXES

Michael J. Fazio; Douglas K. Pollock, and Nicolas J. Kotite, all of Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich.

Continuation-in-part of Ser. No. 65,739, Jun. 24, 1987, and a continuation-in-part of Ser. No. 211,496, Jun. 24, 1988, abandoned, and a continuation-in-part of Ser. No. 265,158, Oct. 31, 1988, abandoned, and a continuation-in-part of Ser. No. 370,956, Jun. 21, 1989, and a continuation-in-part of Ser. No. 289,172, Dec. 23, 1988, abandoned. U.S. Cl. 540—463 **13 Claims**

1. A compound of the formula

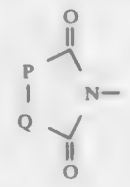
wherein

R^1 is a hydrogen, C_1–C_6-or phenyl-(C_1–C_6-alkyl) wherein phenyl is unsubstituted or substituted with one or more

substituents selected from C_1–C_6-alkyl, C_1–C_6-alkoxy, halogen or trifluoromethyl;

R^2 is a C_2–C_5-alkyl;

R^3 is isopropyl, isobutyl, benzyl, p-hydroxybenzyl, hydroxymethyl, mercaptiomethyl, 1-hydroxyethyl, 2-methylthioethyl, carboxymethyl, 2-carboxyethyl, 3-quanidinopropyl or aminobutyl, wherein a hydroxy group can be protected by a tert-butylbenzyl, tetrahydropyranyl or acetyl group, a mercapto group can be protected by a tert-butyl or benzyl group, an amino group can be acylated by a tert, butoxycarbonyl, benzyloxycarbonyl, formyl, trityl, trifluoroacetyl, 2-(biphenylyl)isopropoxycarbonyl or isobornyloxycarbonyl group, or can be sulfonylated by a C_1–C_6-alkane-sulfonyl, benzenesulfonyl or p-toluenesulfonyl group, and a carboxyl group can be amidated to an aminocarbonyl, (C_1–C_6-alkyl-)aminocarbonyl, di(C_1–C_6-alkyl)aminocarbonyl or phenylaminocarbonyl;



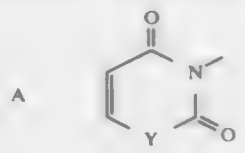
R^4 is a hydrogen or methyl; or

R^3 and R^4 taken together are a group of the formula —$(CH_2)_n$—in which n is an integer from 4 to 11 inclusive;

R^5 is a hydrogen, C_1–C_6-alkyl, carboxyl, C_1–C_6-alkoxycarbonyl or C_1–C_6-alkylaminocarbonyl;

R^6 is C_1–C_6-alkyl; and

X is either cyclic imido group of the formula

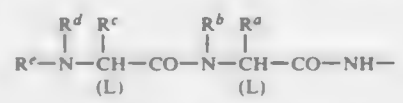


(b)

wherein

P and Q taken together are a group of the formula —CH(R′)—CH(R′)—, —CH(R′)—CH(R′)—CH(R′)—, —O—CH(R′)—, —N(R′)—CH(R′)—, —N(R′)—N(R′)—, —N=N—or —C(R′)=C(R′)—in which each

R′is a hydrogen; C_1–C_6-alkyl; phenyl unsubstituted or substituted with one or more substituents selected form C_1–C_6-alkyl, C_1–C_6-alkoxy, halogen or trifluoromethyl; phenyl-(C_1–C_6-alkyl) wherein phenyl is unsubstituted or substituted with one or more substituents selected from C_1–C_6-alkyl, C_1–C_6-alkoxy, halogen or trifuoromethyl; C_1–C_6-alkanoylamino; or an acylamino group of the formula H_2N—CH(R)—CONH—wherein R is isopropyl, isobutyl, benzyl, p-hydroxybenzyl, hydroxymethyl, mercaptomethyl, 1-hydroxyethyl, 2-methylthioethyl, carboxymethyl, 2-carboxyethyl, 3-quanidinopropyl or aminobutyl, in which the amino group can be protected by a tert.butoxycarbonyl, benzyloxycarbonyl, formyl, trityl, trifluoroacetyl, 2-(biphenylyl)-isopropoxycarbonyl or isobornyloxycarbonyl group, or



P and Q taken together are unsubstituted 1,2-phenylenethienylene, 1,2-naphthylene, 2,3-naphthylene, 1,8-naphthylene or 2,3-anthrylene or substituted by one or more substituents selected from C_1–C_6-alkyl, C_1–C_6-alkoxy, halogen, hydroxy, phenyl-(C_1–C_6-alkoxy) wherein phenyl is unsubstituted or substituted with one or more substituents selected from C_1–C_6-alkyl, C^1–C^6-alkoxy, halogen or trifluoromethyl, nitro, amino, C_1–C_6-alkanoyl-amino, mono(C_1–C_6-alkyl)amino, di(C_1–C_6-alkyl)-amino and C_1–C_6-alkylsulfonylamino; or a group of the formula

(c)

wherein

A is a residue of benzene, naphthalene or enthracene which is unsubstituted or substituted by one or more substituents selected from C_1–C_6-alkyl, C_1–C_6-alkoxy, halogen, hydroxy, phenyl-(C_1–C_6-alkoxy) wherein phenyl is unsubstituted or substituted with one or more substituents selected from C_1–C_6-alkyl, C_1–C_6-alkoxy, halogen or trifluoromethyl, nitro, amino, C_1–C_6-alkanoyl-amino, mono (C_1–C_6-alkyl)amino, di(C_1–C_6-alkyl)-amino and C_1–C_6-alkylsulfonylamino and Y is —O—, —NH—or NR^a in which R^1 is hydrogen or C_1–C_6-alkyl, or a group of the formula

(a)

Ra is isopropyl, isobutyl, benzyl, p-hydroxybenzyl, hydroxymethyl, mercaptomethyl, 1-hydroxyethyl, 2-methylthioethyl, carboxymethyl, 2-carboxyethyl, 3-quanidinopropyl or aminobutyl, wherein a hydroxy group can be protected by a tert-butyl benzyl, tetrahydropyranyl or acetyl group, a mercapto group can be protected by a tert-butyl or benzyl group, an amino group can be acylated by a tert. butoxycarbonyl, benzyloxycarbonyl, formyl, trityl, trifluoroacetyl, 2-(biphenylyl)isopropoxycarbonyl or isobornyloxycarbonyl group,, or can be sulfonylated by a C_1–C_6-alkane-sulfonyl, benzenesulfonyl or p-toluenesulfonyl group, and a carboxyl group can be amidated to an aminocarbonyl, (C_1–C_6-alkyl-)aminocarbonyl, di(C_1–C_6-alkyl)-amino-carbonyl or phenylaminocarbonyl,

R^b is hydrogen or

R^a and R^b taken together are trimethylene.

R^c is isopropyl, isobutyl, benzyl, p-hydroxybenzyl, hydroxymethyl, mercaptomethyl, 1-hydroxyethyl, 2-methylthioethyl, carboxymethyl, 2-carboxyethyl, 3-quanidinopropyl or aminobutyl, wherein a hydroxy group can be protected by a tert-butyl benzyl, tetrahydropyranyl or acetyl group, a mercapto group can be protected by a tert-butyl or benzyl group, an amino group can be acylated by a tert. butoxycarbonyl, benzyloxycarbonyl, formyl, trityl, trifluoroacetyl, 2-(biphenylyl)isopropoxycarbonyl or isobornyloxycarbonyl group,, or can be sulfonylated by a C_1–C_6-alkane-sulfonyl, benzenesulfonyl or p-toluenesulfonyl group, and a carboxyl group can be amidated to an aminocarbonyl, (C_1–C_6-alkyl)aminocarbonyl, di(C_1–C_6-alkyl)-amino-carbonyl or phenylaminocarbonyl,

R^d is hydrogen or

R^c and R^d taken together are trimethylene and R^3 is a protecting group selected from tert. butoxycarbonyl, benzyloxycarbonyl, formyl, trityl, trifluoroacetyl, 2-(biphenylyl)-isopropoxycarbonyl or isobornyloxycarbonyl, acyl is derived from a hydroxymethyl, mercaptomethyl, 1-hydroxyethyl, 2-methylthioethyl, carboxymethyl, 2-carboxyethyl, 3-quanidinopropyl or aminobutyl, wherein a hydroxy group can be protected by a tert-butyl benzyl, tetrahydropyranyl or acetyl group, a mercapto group can be protected by a tert-butyl or benzyl group, an amino group can be acylated by a tert. butoxycarbonyl, benzyloxycarbonyl, formyl, trityl, trifluoroacetyl, 2-(biphenylyl)isopropoxycarbonyl or isobornyloxycarbonyl group,, or can be sulfonylated by a C_1–C_6-alkane-sulfonyl, benzenesulfonyl or p-toluenesulfonyl group, and a carboxyl group can be amidated to an aminocarbonyl, (C_1–C_6-alkyl)aminocarbonyl, di(C_1–C_6-alkyl)-amino-carbonyl or phenylaminocarbonyl,alkanoic) acid wherein phenyl is unsubstituted or substituted with one or more substituents selected from C_1–C_6-alkyl, C_1–C_6-alkoxy, halogen or trifluoromethyl, C_1–C_6-alkyl-sulfonyl or phenyl-sulfonyl wherein phenyl is unsubstituted or substituted with one or more substituents selected from C_1–C_6-alkyl, C_1–C_6-alkoxy, halogen or trifluoromethyl.

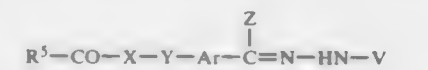
INTERMEDIATES FOR ANTIBODY-VINCA DRUG CONJUGATES



George J. Cullinan, Trafalgar; Bennett C. Laguzza, and William L. Scott, both of Indianapolis, all of Ind., assignors to Eli Lilly and Company, Indianapolis, Ind.

Filed Aug. 8, 1988, Ser. No. 230,084

Int. Cl.[5] C07D *519/04;* A61K *31/475, 39/44;* C07K *15/28*

U.S. Cl. 540—478 7 Claims

1. An intermediate of the formula

wherein

R^5 is hydroxy, an acid-activating group, a moiety which completes a salt, or an acid-protecting group;

Z is hydrogen or C_1–C_3 unbranched alkyl;

X is a bond, C_1–C_4 alkylene, C_2–C_4 alkenylene, or amino-C_1–C_4 alkylene;

Y is a bond, carbonyl, —O—, —S—, or sulfonyl, provided that Y is not a bond, —O—, or —S—when X is aminoalkylene, and that Y is not —O—, —S—, or sulfonyl when X is a bond;

Ar is pyrrolyl, m-phenyl, or p-phenyl, which phenyl groups may be mono- or disubstituted with bromo, chloro, fluoro, methoxy, nitro or C_1–C_3 alkyl;

V is a vinca drug of the formula

wherein R is H, CH_3 or CHO; when R^2 and R^3 are taken singly, R^3 is H, and one of R^1 and R^2 is ethyl and the other is H or OH; when R^2 and R^3 are taken together with the carbons to which they are attached, they form an oxirane ring in which case R^1 is ethyl; R^4 is H, (C_1–C_3 alkyl)-CO, or chlorsubstituted (C_1–C_3 alkyl)-CO.

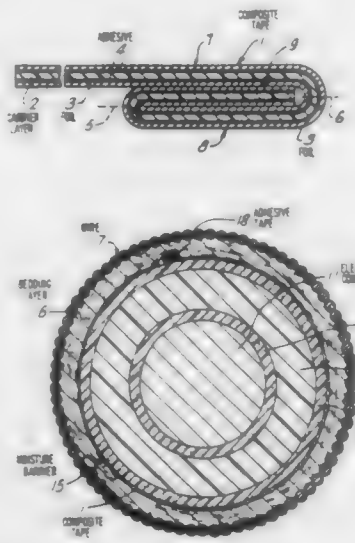
ELECTRIC POWER CABLE



Neil R. Plant, Athens, Canada, assignor to Phillips Cables Ltd., Ontario, Canada

Filed Nov. 20, 1989, Ser. No. 438,008

Claims priority, application United Kingdom, Nov. 25, 1988, 8827681.2

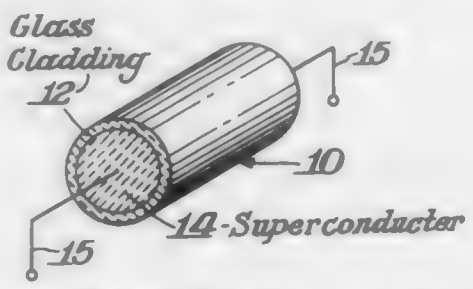
Int. Cl.[5] H01B *7/28*

U.S. Cl. 174—106 SC **13 Claims**

1. An electric power cable comprising at least one cable core consisting of an electric conductor, a conductor screen surrounding the conductor, a dielectric wall of electrically insulating material surrounding the conductor screen, a dielectric screen surrounding the dielectric wall, a moisture-barrier surrounding the dielectric screen and, surrounding the moisture-barrier, a layer of metal or metal alloy, wherein the moisture-barrier of said at least one cable core consists of a composite tape comprising a carrier layer of plastics material which is sandwiched between radially inner and outer substantially fluid-impermeable foils of metal or metal alloy mechanically bonded to major surfaces of the carrier layer and electrically connected together, which composite tape surrounds the dielectric screen of the core with its longitudinally extending edges overlapping and secured to one another throughout their lengths to form a substantially moisture-tight seal between said overlapping edges, the moisture-barrier thereby effecting electrical interconnection between the underlying dielectric screen and the surrounding layer of metal or metal alloy.

5,006,671

GLASS-CLAD SUPERCONDUCTING WIRE



Jan Boeke, P.O. Box 2327, Chapel Hill, N.C. 27514

Continuation-in-part of Ser. No. 234,271, Aug. 19, 1988. This application Sep. 22, 1988, Ser. No. 247,898

The portion of the term of this patent subsequent to Jan. 1, 2008, has been disclaimed.

Int. Cl.[5] H01B *12/00;* **H01L** *39/24*

U.S. Cl. 174—125.1 **17 Claims**

1. A method for producing a glass-clad wire of superconducting material which comprises:

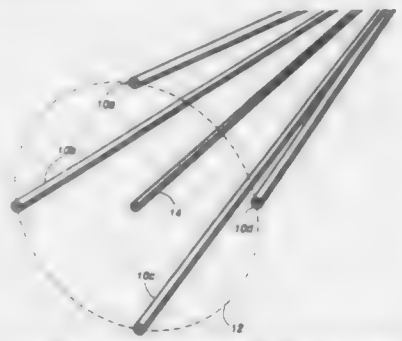
(a) filling a hollow metal container which is sealed at one end with an electrically conductive metal with a superconductive material, providing a layer of glass between the tube and the superconductive material whereby the material is annularly surrounded by a glass layer, and sealing the other end of the tube with an electrically conductive metal,

(b) drawing at least a portion of the filled container through at least one size-reducing die whereby the diameter of the container and its contents is reduced to a wire size, and

(c) heat treating the drawn wire to provide crystallinity in the superconductor material.

5,006,672

APPARATUS FOR STORING HIGH MAGNETIC FIELDS HAVING REDUCED MECHANICAL FORCES AND REDUCED MAGNETIC POLLUTION



Melvin L. Prueitt; Fred M. Mueller, and James L. Smith, all of Los Alamos, N. Mex., assignors to University of California

Patent, Trademark & Copyright Office, Alameda, Calif.

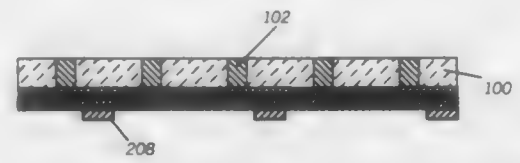
Filed Mar. 29, 1989, Ser. No. 330,329

Int. Cl.[5] H01B *12/00*

U.S. Cl. 174—125.1 **26 Claims**

1. A magnetic energy storage apparatus having reduced mechanical forces and reduced magnetic pollution, which comprises in combination a set of substantially parallel, electrically isolated, elongated outer conducting elements spaced apart in a substantially equally distant manner around the surface of a cylinder having an axis and a chosen diameter, all of said outer conducting elements having a current flowing therein in a first direction, and a center, elongated conducting element disposed along the axis of the cylinder, said center conducting element having a current flowing therein in a direction opposite to the first direction, and wherein the ratio of the magnitude of the current flowing in said outer conducting elements to the magnitude of the current flowing in said center conducting element is selected such that the net force on said outer conducting elements and on said center conducting element is substantially zero away from the ends thereof.

5,006,673



FABRICATION OF PAD ARRAY CARRIERS FROM A UNIVERSAL INTERCONNECT STRUCTURE

Bruce J. Freyman, Sunrise; Barry M. Miles, Plantation, and Jill L. Flaugher, Margate, all of Fla., assignors to Motorola, Inc., Schaumburg, Ill.

Filed Dec. 7, 1989, Ser. No. 447,349

Int. Cl.[5] H05K *3/00*

U.S. Cl. 174—255 **20 Claims**

1. A method of manufacturing a chip carrier from a universal ceramic substrate, comprising the steps of:

providing a universal ceramic substrate having first and second opposed sides and an array of conductively filled through-holes pre-formed prior to a firing of said universal ceramic substrate;

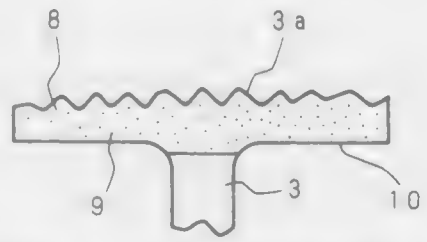
providing wire bond pads and conductors connected to said conductively filled through-holes as required on said first side;

providing solder pads on said conductively filled through-holes as required on said second side; and

providing at least one insulating layer over part of said first side for die attachment.

5,006,674

DISTRIBUTOR AND DISTRIBUTOR ROTOR ELECTRODE



Yutaka Ohashi, Himeji, Japan, assignor to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Filed May 29, 1990, Ser. No. 528,641

Claims priority, application Japan, May 30, 1989, 1-134734; Jun. 16, 1989, 1-152185

Int. Cl.[5] H01H *19/00;* **F02P** *7/02*

U.S. Cl. 200—19 R **6 Claims**

1. A distributor for an internal combustion engine, comprising:

a rotary shaft which rotates in synchronization with a crank shaft of the internal combustion engine;

a distributor rotor fixed to said rotary shaft;

a distributor rotor electrode provided in said distributor rotor; and

a plurality of circumferentially spaced lateral electrodes spaced a discharge gap from a rotation orbit of said distributor rotor electrode;

wherein a noise suppressing mica layer containing mica is formed at least on a part of the surface of a radially outermost portion of said distributor rotor electrode, and

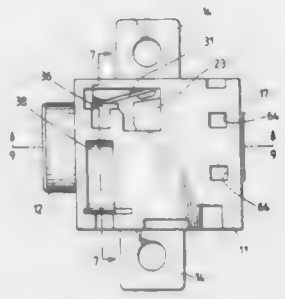
wherein said mica layer is formed of particulate mica material uniformly dispersed in an organic resin.

6. A distributor rotor electrode provided in a distributor rotor of a distributor, comprising:

a noise suppressing mica layer containing mica and being provided at least at one face of a discharging section of said electrode, wherein said mica layer is formed of particulate mica material uniformly disperesed in an organic resin.

5,006,675

JACK WITH A SWITCH



Nobuya Sakaguchi, Nara, Japan, assignor to Hosiden Electronics Co., Ltd., Osaka, Japan

Filed Mar. 30, 1990, Ser. No. 501,756

Claims priority, application Japan, Apr. 3, 1989, 1-39733[U]

Int. Cl.[5] H01H *27/00*

U.S. Cl. 200—51.09 **4 Claims**

1. A jack comprising a body of insulating material having a plug receiving hole therein, said body supporting a plurality of contact pieces and a switch, said contact pieces and switch being so arranged that, when a plug is inserted into said plug receiving hole, said plurality of contact pieces make contact with said plug and said switch is actuated to an ON or OFF state;

said body having a switch housing portion extending from a back face of said body substantially parallel to a central axis of said plug receiving hole, said plug receiving hole being separated by a partition wall from said switch housing portion;

said partition wall having a communicating hole therein through which said switch housing portion and said plug receiving hole communicate with each other;

a separator of insulating material disposed in said switch housing portion along said partition wall;

an actuating projection formed at a forward end portion of sais separator, said actuating projection protruding into said plug receiving hole through said communicating hole;

said switch comprising fixed and movable pieces disposed in said switch housing portion, said movable piece being engaged by said separator, insertion of said plug into said plug receiving hole being operative to engage said actuating projection of said separator to displace said movable piece into or out of contact with said fixed piece;

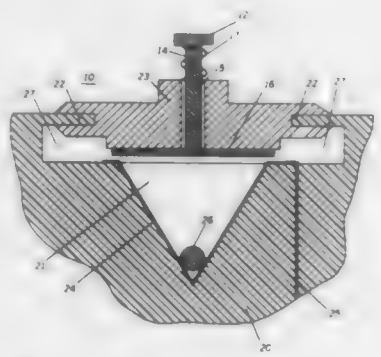
a first outer wall surface of said body parallel to said central axis of said plug receiving hole having a window communicating with said plug receiving hole;

said body having a first groove extending from said first outer wall surface, along a second outer wall surface of said body perpendicular to said first outer wall surface but parallel to said central axis of said plug receiving hole, to

a third outer wall surface of said body parallel to said first outer wall surface; and

a first one of said plurality of contact pieces being disposed in said first groove, said first contact piece having a stationary portion fixed in said first groove, a ground terminal extending from said stationary portion and projecting out of said first groove, and an elastic contact portion extending from said stationary portion substantially at right angles thereto and along said first outer wall surface of said body, said elastic contact portion having a tip end portion that projects into said plug receiving hole through said window.

5,006,676



MOVEMENT SENSOR SWITCH

Henry A. Bogut, Coral Springs; Anthony Dolezal, Pompano Beach, and Jose M. Fernandez, Plantation, all of Fla., assignors to Motorola Inc., Schaumburg, Ill.

Filed Dec. 26, 1989, Ser. No. 457,138

Int. Cl.[5] H01H *35/14*

U.S. Cl. 200—61.52 **19 Claims**

1. A tilt switch comprising:

a non-conductive body including a substantially conical cavity, at least a portion of the cavity being electrically conductive;

an electrical contact arranged and constructed to form a seal above the cavity and spaced from the conductive portion of the cavity, said electrical contact being selectively movable into contact with the electrically conductive portion of the cavity for providing a momentary contact function;

a conductive ball within the cavity for selectively interconnecting the contact and the conductive portion of the cavity when the switch is tilted.

5,006,677

AUTOMOBILE BRAKE VACUUM SWITCH

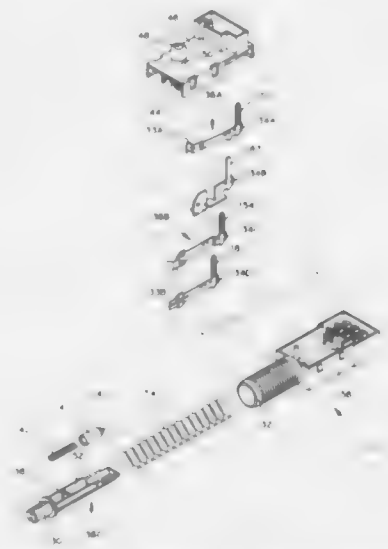
John W. Smith, and James P. Meagher, both of Indianapolis, Ind., assignors to Emhart Industries Inc., Farmington, Conn.

Filed Jan. 31, 1990, Ser. No. 472,727

Int. Cl.[5] H01H *3/14*

U.S. Cl. 200—61.89 **8 Claims**

1. An automobile brake switch assembly comprising:



a housing including: a switch chamber, a vacuum passageway having a passageway vent hole therein; and a plunger chamber communicating with said switch chamber;

a plunger slidable within said plunger chamber;

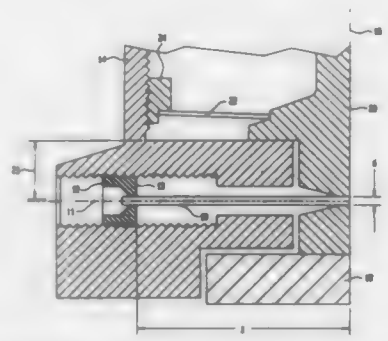
one or more switches enclosed in said switch chamber and operable by said plunger;

a sealing member;

said plunger including means for slidably supporting said sealing member so that as said plunger moves back and forth in said plunger chamber said sealing member alternately seals and unseals said passageway vent hole; and spring means located between said plunger and said sealing member for permitting said plunger to continue moving

when said sealing member is stopped and seated in said passageway vent hole.

5,006,678



PRESSURE SWITCH WITH DEADBAND ADJUSTMENT

Lawrence A. Dunham, Northridge, Calif., assignor to ITT Corporation, New York, N.Y.

Filed Oct. 23, 1989, Ser. No. 425,773

Int. Cl.[5] H01H *35/40*

U.S. Cl. 200—83 S **20 Claims**

1. In combination:

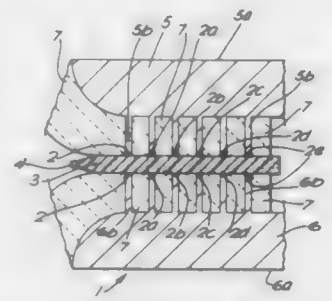
sensor means mounted for movement on an operating axis of a housing; and

a wand inserted into said sensor means perpendicular to said operating axis, said wand being fixed and adjustable in said housing at one end and driven at the other end by said sensor means, whereby said wand provides adjustment for said sensor means.

5,006,679

HIGH VOLTAGE SWITCH ASSEMBLY

Edward Thornton, Bristol, United Kingdom, assignor to British Aerospace Public Limited Company, London, England



Filed May 14, 1990, Ser. No. 523,244

Claims priority, application United Kingdom, Jun. 15, 1989, 8913744

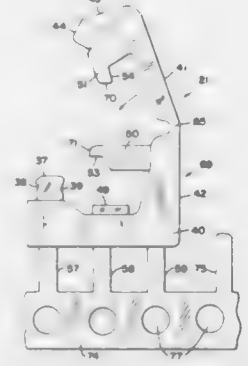
Int. Cl.[5] H01H *33/04*

U.S. Cl. 200—144 R **10 Claims**

1. A high voltage switch assembly, including a pair of electrically conductive contacts connectible in a power line from a high voltage source, and a portion of solid electrically insulating explosive material forming an electrically insulating barrier extending between said contacts, with the arrangement being such that on detonation of the explosive material at a point removed from the contacts a detonation wave is propagated

from the detonation point through the explosive material, which as it passes between the contacts establishes electrical conduction there between to initiate a switch closing action, the gaseous products of detonation following behind the detonation wave being electrically insulating and breaking electrical conduction between the contacts to initiate a switch opening action.

5,006,680



SNAP ACTION SWITCH

Joseph Thomas, Reading, Mass., assignor to Augat, Inc., North Andover, Mass.

Filed May 5, 1989, Ser. No. 348,032

Int. Cl.[5] H01H *11/00*

U.S. Cl. 200—293 **31 Claims**

1. A miniature precision action switch comprising:

a unitary resilient insulating body configured in an incomplete loop, the resilience tending to open the loop and the body having a latch within the loop to retain its loop configuration; the loop comprising a complete cover section, a complete base section and a complete side section that circumscribe an inner loop area;

a first terminal imbedded in the body and extending into the inner loop area as an exposed post;

a metallic member having: a cut-out tongue having an end; a complete surround about the tongue; a longitudinal axis; a longitudinal end adjacent the tongue end to form a space therebetween; and another longitudinal end within the loop; the member being on and electrically connected to the post with the post inserted in the space between the tongue and the adjacent surround to bend the tongue to form a spring;

a nose extending from the cover section toward the base section and toward the post to form an incomplete side section of the loop;

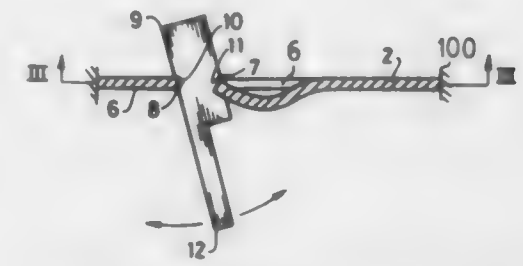
second and third terminals imbedded in the body and having

parts exposed on opposite sides of the other end of the member respectively;

wherein the other member end is normally connected to one of the second and third terminal exposed parts to complete an electrical circuit between the post and the one terminal, and when the nose is pressed against the surround adjacent the end of the tongue, the other end of the member is snapped to contact the exposed part of the other of the second and third terminals to complete an electrical circuit between the post and the other of the second and third terminals.

5,006,681

LEAF SPRING SYSTEM AND AN ELECTRIC SWITCH PROVIDED WITH SUCH A LEAF SPRING SYSTEM



Albert J. Postmus, Hengelo, and Derk van der Scheer, Goor, both of Netherlands, assignors to Holec Systemen En Componenten B.V., Hengelo, Netherlands

Filed Dec. 28, 1988, Ser. No. 291,257

Claims priority, application Netherlands, Dec. 31, 1987, 8703173

Int. Cl.[5] H01H *5/14*

U.S. Cl. 200—409 **17 Claims**

1. A leaf spring system for operation on at least one body, the leaf spring system used in combination with an immovable base member and comprising at least one leaf spring having first and second opposite ends, and a supporting frame defining at least one frame aperture having fixed first and second opposite edges, the leaf spring being supported at the first end thereof at said first fixed edge of the frame aperture, the second end of the leaf spring projecting in the direction of and terminating at a distance from said second fixed edge of the frame aperture, thereby defining a space for accommodating the body to be hingedly supported by said second fixed edge of the frame aperture and to be engaged by the second end of the leaf spring, the body having a dimension measured upon accommodation between the supporting second fixed edge of the frame aperture and the engaging second end of the leaf spring which is greater than the distance from the second fixed edge of the frame aperture to the second end of the leaf spring when the body is not accommodated in the space, the supporting frame being immovably fixed to the immovable base member and thereby secured against movement relative to the leaf spring and body during operation of the leaf spring system, whereby the leaf spring exerts a force against the body in a longitudinal direction relative to the first fixed edge of the frame aperture.

5,006,682

LINEAR SNAP ACTION OPERATING MECHANISM AND AN ELECTRICAL SWITCH INCORPORATING SAME

Michael E. Sloff, Winston Salem, and Neal E. Rowe, Asheville, both of N.C., assignors to Westinghouse Electric Corp., Pittsburgh, Pa.

Filed May 24, 1989, Ser. No. 356,091

Int. Cl.[5] H01H *15/18*

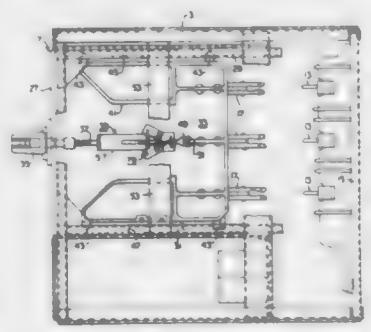
U.S. Cl. 200—429 **6 Claims**

1. An operating mechanism for an electrical switch having

first contact means which are movable into and out of engagement with second contact means, said mechanism comprising:

a housing having an elongated internal chamber and an elongated slot;

a rod extending through said housing longitudinally into said elongated internal chamber and longitudinally slidable relative to said elongated internal chamber;



a pair of compression springs in said elongated internal chamber, one of which is loaded by movement of said rod in a first direction and the other of which is loaded by movement of the rod in the opposite direction;

latching means for movement between a latched position in which movement of said housing in correspondence with movement of said rod is prevented and an unlatched position in which the housing is released to move longitudinally, said compression springs being loaded in compression by movement of said rod with said housing in the latched position;

trip means carried by said rod projecting radially outward from said rod through said elongated slot for moving said latching means from the latched position to the unlatched position at a predetermined point of travel of said rod;

connecting means for connecting said housing to said first contact means; and

handle means connected to said rod for moving said rod in said first direction with said latching means in the latched position thus preventing movement of said housing to thus load said one spring until said trip means moves said latching means to the unlatched position thus releasing said

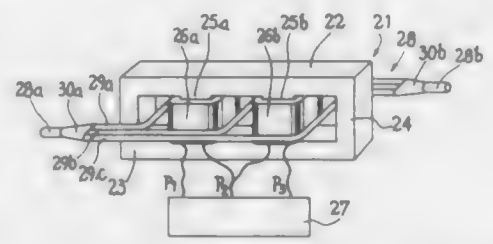
housing which in turn is accelerated in said first direction by said one spring to rapidly drive said first contact means into engagement with said second contact means, and for moving said rod in the opposite direction with said latching means in said latched position thus preventing movement of said housing to thus load the other spring until said trip means moves said latching means to the unlatched position thus releasing said housing which in turn is accelerated by said other spring to rapidly withdraw said first contact means from engagement with said second contact means;

said latching means comprising: a first latch unit, first mounting means mounting said first latch unit for pivotal movement between said latched position in which said first latch unit engages and prevents movement of said housing in said first direction and said unlatched position in which said housing is free to move in said first direction; a second latch unit, second mounting means mounting said second latch unit for pivotal movement between said latched position in which said second latch unit engages and prevents movement of said housing in said opposite direction, and said unlatched position in which said housing is free to move in said opposite direction; and biasing means biasing said first and second latch units to said latched positions, said trip means engaging said first and second latch units and pivoting them to their unlatched positions when the rod reaches predetermined points of travel in said first and opposite directions respectively; and

said trip means including adjustment means connected to said radial projections movable generally parallel to said rod to adjust the points in rod travel in said first and opposite directions, and hence the amount of spring compression at which said first and second latch units respectively are moved to their unlatched positions.

5,006,683

DEVICE FOR THE ELECTRICAL INDUCTION HEATING OF A FLUID CONTAINED IN A PIPELINE



Jacques Rapin, Lyons, and Philippe Vaillant, Cambrai, both of France, assignors to Framatome, Courbevoie, France

Filed Mar. 9, 1990, Ser. No. 491,430

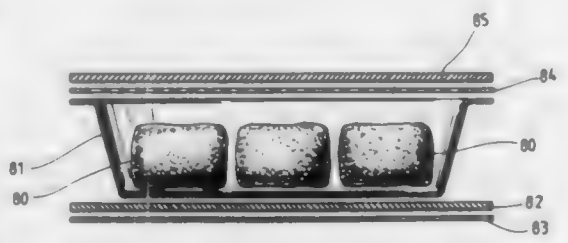
Claims priority, application France, Mar. 10, 1989, 89 03188

Int. Cl.[5] H05B *6/10*

U.S. Cl. 219—10.51 **5 Claims**

1. Device for the electrical induction heating of a fluid contained in a pipeline (**28**) having a closed-circuit (*29a, 29b, 29c*), said device consisting of a transformer (**21**) having two primary windings (*26a, 26b*) connected to a three-phase current source (**27**) and a secondary part consisting of the closed circuit (*29a, 29b, 29c*) of said pipeline containing the fluid, wherein said transformer (**21**) comprises a magnetic circuit (**22**) in the form of a closed frame having four parallel columns (**23, 24, 25a, 25b**), each of said primary windings being arranged around a different one of said columns of said frame (**22**) and being connected at a first end thereof to a first phase (P1) and a third phase (P3), respectively, and at a second end thereof to a second phase (P2) of said three-phase current source (**27**), said closed circuit of said pipeline consisting of three branched tubular arms (*29a, 29b, 29c*), each passing through a gap between two of said columns (**23, 24, 25a, 25b**) of said frame (**22**) of said magnetic circuit.

5,006,684



APPARATUS FOR HEATING A FOOD ITEM IN A MICROWAVE OVEN HAVING HEATER REGIONS IN COMBINATION WITH A REFLECTIVE LATTICE STRUCTURE

Dan J. Wendt, Lino Lakes; Jonathon D. Kemske, New Brighton, and Peter S. Pesheck, Brooklyn Center, all of Minn., assignors to The Pillsbury Company, Minneapolis, Minn.

Continuation of Ser. No. 119,381, Nov. 10, 1987, Pat. No. 4,927,991. This application Sep. 5, 1989, Ser. No. 404,200

Int. Cl.[5] H05B *6/80*

U.S. Cl. 219—10.55 E **34 Claims**

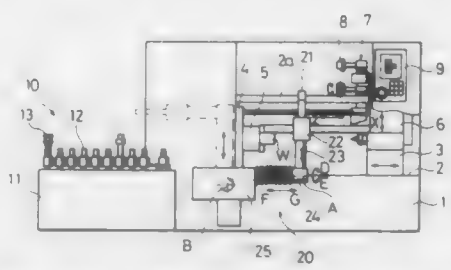
1. An apparatus for heating a food item in a microwave oven, comprising:

a food item to be heated in a microwave oven, the food item having a surface to be heated;

a food heating device having a non-edible heater in combination with predetermined regions of higher reflectance forming a lattice structure surrounding regions of the heater having less reflectance, the heater being capable of heating sufficiently to produce a positive temperature differential with respect to the surface of the food item, the regions of the lattice structure having a reflectance at the frequency of the microwave oven, the regions of the heater having a reflectance at the frequency of the microwave oven, the lattice structure regions having higher reflectance relative to the regions of the heater at the frequency of the microwave oven, the difference between the reflectance of the regions of the lattice structure and the reflectance of the regions of the heater being ten percent or greater, the regions of the heater comprising a material which heats responsive to microwave radiation and which has a transmittance at the frequency of the microwave oven greater than 0.003 percent, the device being located in close proximity to the surface of the food item so that the heater and lattice structure may cooperate to heat said surface, the heater and lattice structure being located on the same side of the good item during heating.

5,006,685

MACHINE TOOL WITH GRINDING FUNCTION AND TRUING/DRESSING METHOD OF GRINDING STONE USING IT



Sakae Hatano, Aichi; Yoshiharu Takada, Chiba; Kiyokazu Kainuma, Aichi; Isao Kanematsu, Aichi; Kazuo Asano, Aichi; Hisashi Yoshida, Aichi, and Yoshinori Mori, Gifu, all of Japan, assignors to Yamazaki Mazak Corporation, Aichi, Japan

Filed Aug. 3, 1988, Ser. No. 227,881

Claims priority, application Japan, Aug. 4, 1987, 62-119484[U]; Aug. 4, 1987, 62-119485[U]; Aug. 4, 1987, 62-119486[U]; Aug. 4, 1987, 62-194766; Nov. 17, 1987, 62-175713[U]

Int. Cl.[5] B23H *5/04*; **B24B** *53/00*

U.S. Cl. 219—69.2 **17 Claims**

17. A truing and dressing method in a complex machine tool having a truing and dressing apparatus, said complex machine tool having a truing and dressing apparatus comprising:

a single machine body;

workpiece holding means for holding a workpiece on which grinding machining is to be performed disposed on said machine body so as to be free to be driven and rotated about an axis parallel to a first direction;

a tool rest disposed on said machine body free to be driven and moved in at least said first direction and so as to be capable of holding at least a turning tool for electrode machining and a grinding tool for workpiece machining installed thereon;

a dressing main body provided on said machine body so as to be free to be driven and moved in said first direction;

a supporting shaft provided on said dressing main body such that the central axis of said shaft is parallel to said first direction and such that said supporting shaft is free to be driven and rotated about said central axis, said supporting shaft having a machining electrode installed thereon for truing and dressing said grinding tool;

a tool electrode provided on said dressing main body so as to be free to be driven and moved, said tool electrode being capable of engaging and contacting with said grinding tool; and

a tailstock provided on said dressing main body at a position facing said workpiece holding means;

wherein said truing and dressing method using said complex machine tool having a truing and dressing apparatus comprises:

holding a workpiece between said workpiece holding means and said tailstock;

performing grinding machining on said workpiece with said grinding tool installed on said tool rest;

rotating said machining electrode and shaping said machining electrode by turning with said turning tool installed on said tool rest;

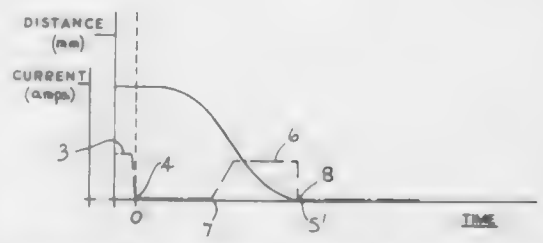
maintaining said grinding tool installed on said tool rest at a predetermined truing and dressing position and driving said tool electrode so as to engage and contact said grinding tool with said tool electrode at said predetermined truing and dressing position; and

performing a truing dressing operation between said rotating machining electrode shaped by said turning tool and said grinding tool while said grinding tool is rotated at said predetermined truing and dressing position;

wherein said steps of grinding said workpiece with said grinding tool, shaping by turning said machining electrode and truing and dressing said grinding tool with said shaped machining electrode are all performed on said single machine body.

5,006,686

CONTROL OF STUD-WELDING APPARATUS



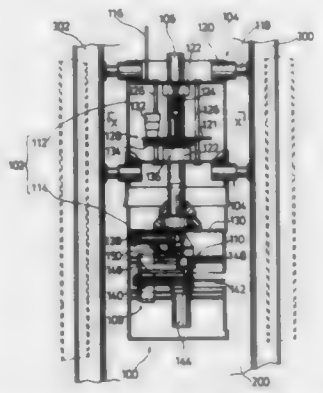
Klaus G. Schmitt, Giessen, and Harald Knetsch, Herborn, both of Fed. Rep. of Germany, assignors to Emhart Inc., Newark, Del.

Filed Sep. 6, 1990, Ser. No. 578,547

Claims priority, application Fed. Rep. of Germany, Sep. 15, 1989, 3930929

Int. Cl.[5] B23K *9/20*

U.S. Cl. 219—99 **3 Claims**



1. Method of controlling stud-welding apparatus for automatic attachment of welding studs comprising a stud-holder, an electromagnetic lifting coil arranged and adapted to lift the stud-holder away from a workpiece to which it is applied and mechanical plunge return means tending to urge the stud-holder towards the workpiece so that in operation the electromagnetic lifting coil works against the mechanical plunge return means during the lift stroke and the plunge stroke is derived from the mechanical return means characterized in that at the beginning of the plunge stroke the lifting coil is essentially current and voltage free but the plunge stroke is damped by a pulse current momentarily applied to the lifting coil a very short time before impact and ceased when the stud contacts the workpiece.

5,006,687

METHOD FOR CUTTING STEEL PIPE PILES

Tsutomu Fujita; Hidetoshi Imura, and Kohzo Akahide, all of Tokyo, Japan, assignors to Kawasaki Steel Corporation, Kobe, Japan

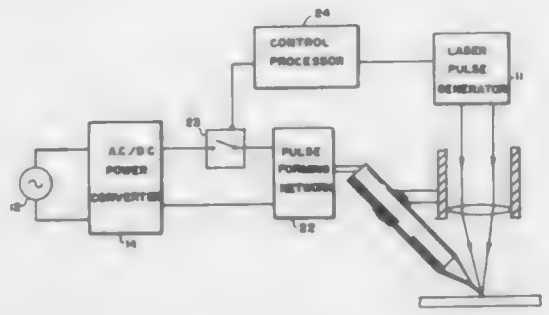
Filed Sep. 29, 1989, Ser. No. 415,073
Int. Cl.[5] B23K 9/00
U.S. Cl. 219—121.59 3 Claims

1. A method of cutting a steel pipe in the form of an erected interlocked steel pipe pile being consisted of a steel pipe and junction joints for interlocking neighboring steel piles which are attached on the outer surface of the pipe along the whole length thereof, comprising the steps of:

inserting a plasma arc cutting means into the steel pipe to be cut, and

cutting the steel pipe at a desired level by the cutting means, including the steps of:

cutting at first the junction joints by mechanical cutting means; and then



cutting the steel pipe body by the plasma arc cutting means.

5,006,688

LASER-ARC APPARATUS AND METHOD FOR CONTROLLING PLASMA CLOUD

Michael A. Cross, Severna Park, Md., assignor to Westinghouse Electric Corp., Pittsburgh, Pa.

Filed Oct. 24, 1988, Ser. No. 261,545
Int. Cl.[5] B23K 9/067
U.S. Cl. 219—130.4 20 Claims

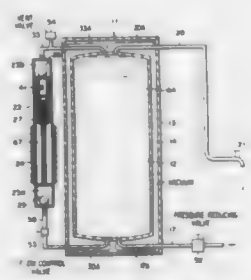
1. A laser-arc apparatus comprising:

a laser pulse generator for generating a laser pulse and directing said laser pulse toward a worksite on a workpiece, said laser pulse creating a plasma cloud at said worksite by heating said worksite;

an arcing means for arcing energy from an electrode thereof to said worksite;

a power supply for supplying said energy to said arcing means;

storage means for storing said energy supplied to said arcing means;



control means, including circuit means for controlling said laser pulse generator to generate a train of laser pulses, each pulse of the train having a predetermined duration and pulse interval, each pulse duration being sufficient to cause said plasma cloud to be sufficiently conductive to draw said stored energy from said storage means in said arcing means to said worksite for initiating an arc and each pulse interval being of sufficient duration for dissipating each created plasma cloud.

5,006,689

VACUUM INSULATED STORAGE-TYPE ELECTRIC WATER HEATER HAVING AN EXTERNAL BUBBLE PUMP HEATING UNIT

Yasuhiko Kurachi, Aichi; Kazumi Mori, Okazaki, and Hisao Koizumi, Zushi, all of Japan, assignors to Chubu Electric Power Company Inc., Nagoya and Kabushiki Kaisha Toshiba, Kawasaki, both of, Japan

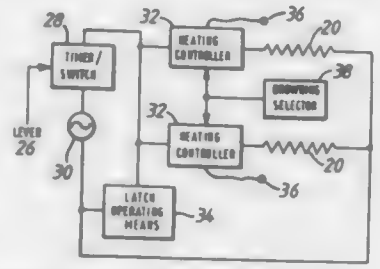
Filed Sep. 21, 1988, Ser. No. 247,375
Claims priority, application Japan, Sep. 21, 1987, 62-236858
The portion of the term of this patent subsequent to Sep. 25, 2007, has been disclaimed.
Int. Cl.[5] H05B 1/02; F24J 2/00; F24H 1/18, 1/10
U.S. Cl. 392—450 7 Claims

1. A hot water boiling apparatus comprising:

a hot water storage tank including an inner tank adapted to store water therein and having a top wall, and an outer tank enclosing the inner tank, and a vacuum heat insulation space defined between the inner and outer tanks and substantially completely surrounding the inner tank;

a hot water supply pipe for guiding the water from an upper portion of the inner tank to the outside of the hot water tank, said supply pipe having an end portion connected to the top wall of the inner tank and passing through the vacuum insulation space and the outer tank air-tightly, said supply pipe having an insulation portion located in the vacuum insulation space and extending substantially horizontally through the vacuum space to the outer tank;

water supply means for supplying a lower portion of the inner tank with water; and



flow-type water heating means arranged external of the water storage tank in flow communication with the water storage tank, for drawing the stored water from the lower portion of the inner tank and, after heating the water, returning the heated water into the upper portion of the inner tank, said heating means including a connecting pipe which introduces the heated water into the inner tank and has an end portion connected to the top wall of the inner tank and passing through the insulation space and the outer tank air-tightly, said connecting pipe having an insulation portion located in the vacuum insulation space and extending substantially horizontally through the vacuum space to the outer tank.

ELECTRIC TOASTERS

Graham M. Cole, Lymington, and Percival J. Shave, both of Lymington, England, assignors to Dreamland Electrical Applicances plc, Southampton, England

PCT No. PCT/GB88/00018, § 371 Date Aug. 29, 1988, § 102(e) Date Aug. 29, 1988, PCT Pub. No. WO88/05279, PCT Pub. Date Jul. 28, 1988
PCT Filed Jan. 12, 1988, Ser. No. 238,338
Claims priority, application United Kingdom, Jan. 15, 1987, 8700878; European Pat. Off., Jan. 11, 1988, 88300187
Int. Cl.[5] H05B 1/02
U.S. Cl. 219—385 18 Claims

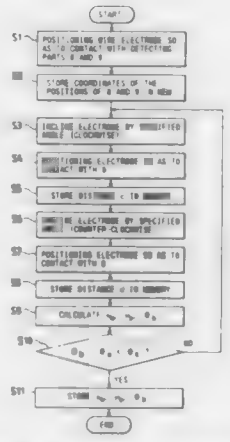
1. An electric toaster comprising:

a pair of electrically heatable plates which have toasting surfaces that can be brought into contact with opposed surfaces of an item to be toasted;

selector means that is manually adjustable to select a desired set point temperature;

temperature sensing means for sensing the temperature of at least one of said toasting surfaces;

heating control means responsive to said selector means and said temperature sensing means to control electrical heating of said plates such that said toasting surfaces are heated to temperatures corresponding to said selected set point temperature; and



timer means for causing said electrical heating of said plates to take place for a predetermined period of time, the duration of said predetermined period of time being manually adjustable independently of said manual adjustment of said set point temperature.

5,006,691

WIRE CUT ELECTRIC DISCHARGE MACHINE

Yoshiro Nakayama, Aichi, Japan, assignor to Mitsubishi Denki K.K., Tokyo, Japan

Filed Apr. 17, 1990, Ser. No. 509,834
Claims priority, application Japan, Apr. 19, 1989, 1-99145
Int. Cl.[5] B23H 7/06
U.S. Cl. 219—69.12 4 Claims

4. A method for correcting a taper angle of a wire electrode of a wire cut electric discharge machine in which upper and lower wire guides are moved horizontally under applying tension to said electrode, comprising the steps of:

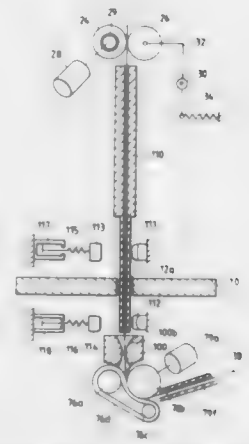
setting a taper angle of said wire electrode;

calculating a distance between said upper and lower wire guides, which corresponds to the taper angle thus set;

machining a test workpiece with the taper angle and the distance calculated for test-machining;

detecting an error in the taper angle, which occurs during the test-machining;

obtaining a correction factor based on the calculated distance between the upper and lower wire guides and an actual distance thereof in the test-machining; and



correcting the positions of the upper and lower wire guides according to the correction factor.

5,006,692

WIRE ELECTRODE SUPPLYING DEVICE FOR USE IN A WIRE CUT ELECTRIC DISCHARGE MACHINING APPARATUS

Takuji Magara; Takeshi Iwasaki; Toshio Suzuki, and Masahiro Yamamoto, all of Aichi, Japan, assignors to Mitsubishi Denki K.K., Tokyo, Japan

Filed May 18, 1989, Ser. No. 353,421
Int. Cl.[5] B23H 7/10
U.S. Cl. 219—69.12 3 Claims

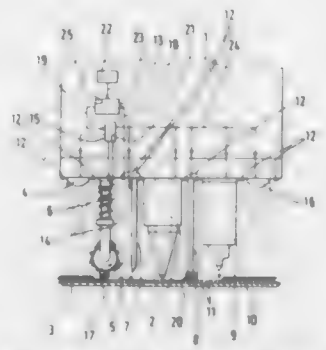
1. A wire electrode supplying device for use in a wire cut electric discharge machining apparatus having a stationary portion provided with V-guides, comprising: a wire electrode feeding mechanism; a pipe guide into which a wire electrode is inserted so as to be guided therealong toward a machining start hole formed in a workpiece to be machined; a lifting mechanism for reciprocating said pipe guide up and down; an electric feeder for supplying a machining electric current to said wire electrode; and a winding mechanism for winding and removing said wire electrode supplied through said electric feeder, wherein said pipe guide is shaped to have a plurality of outside diameters increasing stepwise, wherein an outside diameter of one end portion of said pipe guide which is minimum in outside diameter is smaller than an outer diameter of said machining start hole so that said one end portion of said pipe guide is inserted into said machining start hole in said workpiece by said lifting mechanism before said wire electrode is fed to said winding mechanism, said pipe guide and said V-guides not interfering with each other.

5,006,693

GAP VOLTAGE DETECTOR IN A WIRE-CUT ELECTRIC DISCHARGE MACHINE

Haruki Obara, Toyama, and Syuzo Izumiya, Fujiyoshida, both of Japan, assignors to Fanuc Ltd, Minamitsuru, Japan

PCT No. PCT/JP89/00087, § 371 Date Jul. 3, 1989, § 102(e) Date Jul. 3, 1989, PCT Pub. No. WO89/07032, PCT Pub. Date Aug. 10, 1989
PCT Filed Jan. 30, 1989, Ser. No. 381,635
Claims priority, application Japan, Feb. 3, 1988, 63-22117
Int. Cl.[5] B23H *1/02, 7/14*
U.S. Cl. 219—69.12 2 Claims



1. A gap voltage detector in wire-cut electric discharge machine, comprising:
means for detecting a first voltage between a first conductor and a workpiece;
means for detecting a second voltage between said workpiece and a second conductor which is disposed in a position opposite said first conductor; and
means for detecting a gap voltage on the basis of the sum of the thus detected first and second voltages.

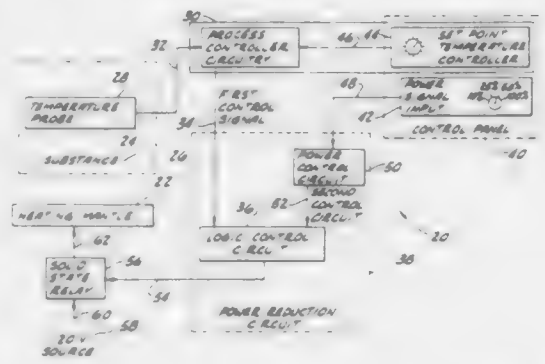
ROBOT TYPE APPARATUS FOR PERFORMING A PLURALITY OF OPERATIONS ON A WORK PIECE

Guenther Handke, Irschenberg, and Hans-Juergen Lemke, Neubiberg, both of Fed. Rep. of Germany, assignors to Messerschmitt-Boelkow-Blohm GmbH, Munich, Fed. Rep. of Germany

Filed Mar. 8, 1989, Ser. No. 321,226
Claims priority, application Fed. Rep. of Germany, Mar. 8, 1988, 3807476
Int. Cl.[5] B23K *26/00*
U.S. Cl. 219—121.6 20 Claims



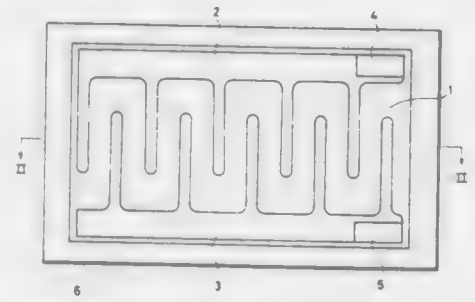
1. A robot type apparatus for performing a plurality of operations on a work piece, comprising main laser tool means for performing a primary operation with a laser beam, a first set of auxiliary tool means for performing secondary operations on said work piece prior to said primary operation, a second set of auxiliary tool means for performing secondary operations on said work piece subsequent to said primary operation, tool carrier means for supporting said main laser tool means for said primary operation and for supporting said first and second set of auxiliary tool means in such positions on said tool carrier means relative to said main laser tool means that said secondary operations can be performed to enhance or improve said primary operation, said apparatus further comprising control means for controlling the operation of said main laser tool means and said first and second sets of auxiliary tool means in a closed loop or open loop manner, drive means (15) connected to said control means for operating said main laser tool means and said first and second sets of auxiliary tool means in response to said control means, sensor means (12) arranged for sensing a surface condition on a work piece surface next to the respective auxiliary tool means to provide control signals for said control means, wherein said control means comprise a memory (22) and a computer (25) for operating said main laser tool means and said first and second sets of auxiliary tool means in response to control values stored in said memory and in response to said control signals provided by said sensor means (12), and for controlling a relative motion between said tool carrier means and said work piece.

5,006,695

PROCESS CONTROLLER INCLUDING POWER LEVEL CONTROL AND METHOD OF OPERATION

Robert C. Elliott, 499 Hillbrook Dr., St. Louis, Mo. 63011

Filed Sep. 7, 1989, Ser. No. 404,211
Int. Cl.[5] H05B *1/02*
U.S. Cl. 219—494 21 Claims



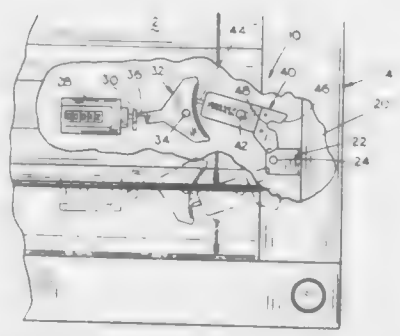
1. An apparatus for controlling means for heating a substance in accordance with a selected maximum power level which is to be applied to the means for heating and in accordance with a selected temperature to which the substance is to be heated, said apparatus for use in combination with means for sensing a temperature of the substance, said apparatus comprising:
first means for generating a first power level control signal which is a function of the difference between the selected temperature and the sensed temperature;
second means for generating a second power level control signal, independent of the first power level control signal and independent of the selected and sensed temperatures, which is a function of the selected maximum power level;
means for providing power for said means for heating; and
means for selectively applying power provided by said means for providing to the means for heating at a power level as defined by both the first and second power level control signals whereby the amount of power applied to the means for heating is reduced as the substance approaches the selected temperature thereby avoiding overheating the substance to a temperature significantly above the selected temperature.

5,006,696

FACE-LIKE HEATING DEVICE

Katsuyuki Uchida, and Hiroto Fujiwara, both of Nagaokakyo, Japan, assignors to Murata Manufacturing Co., Ltd., Japan

Filed Aug. 7, 1989, Ser. No. 390,607
Claims priority, application Japan, Aug. 26, 1988, 63-213177
Int. Cl.[5] H05B *3/26*
U.S. Cl. 219—505 5 Claims



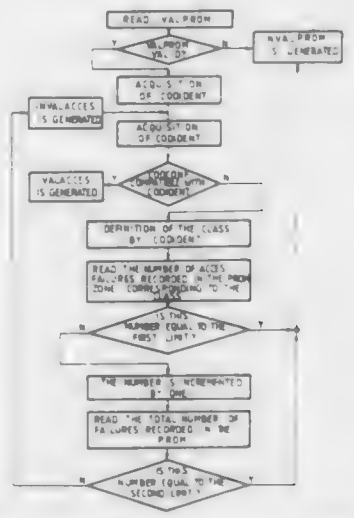
1. A face-like heating device comprising:
a sheet-like organic positive temperature coefficient (PTC) thermistor having two major surfaces,
at least one pair of electrodes formed on one major surface of said organic PTC thermistor, and
a soaking plate adhered to the other major surface of said organic PTC thermistor,
the thickness of said soaking plate being in the range of 0.1 mm to 0.3 mm,
the soaking plate being formed of a material having a thermal conductivity of 0.4 cal $cm^{-1} s^{-1} deg^{-1}$ or higher.

5,006,697

SEQUENTIAL SEAL

Lyan F. Amis, Valley, and Daniel R. Gee, Lincoln, both of Nebr., assignors to Convoy Security Company, Omaha, Nebr.

Filed Jan. 19, 1990, Ser. No. 467,492
Int. Cl.[5] G06M *1/08, 1/276*
U.S. Cl. 235—91 R 2 Claims



1. In combination,
a van body having a door opening formed therein defined by at least one vertically disposed door frame member,
a roll-up door selectively vertically movably mounted in said door opening and movable between open and closed positions,
and a sequential seal means operatively associated with said door, said seal means including indicator means for indicating the number of times said door has been moved from said closed position towards said open position,
said sequential seal means comprising a counter means mounted on said door and having a counter actuator extending therefrom, a spring loaded counter driver lever pivotally mounted, about a horizontal axis, in said door and movable between first and second positions, said counter drive level having inner and outer ends, said counter driver lever arm extending therefrom at the inner end thereof adapted to engage said counter actuator when said counter driver lever is moved from said first position to said second position, said counter drive lever normally being in said first position when said door is in said closed position and in said second position when said door has been moved to said open position, said counter drive lever having an arcuate cam surface at said outer end thereof, a trip driven lever pivotally mounted, about a horizontal axis, on said door outwardly of said counter driver lever and having inner and outer ends, said trip driven lever having a spring-loaded pin means mounted thereon extending from the inner end thereof which is in engagement with said arcuate cam surface, said trip driven lever being movable between first and second positions, said trip driven lever normally being in said first position to position said counter driver lever in said first position, said spring-loaded pin causing said counter driver lever to pivot to said second position when said trip driven lever is moved to said second position, said outer end of said trip driven lever having a trip lever pin receiving opening formed therein, and a trip lever pin mounted in said door frame member.

5,006,698

ANTIFRAUD METHOD AND DEVICE FOR A SELECTIVE ACCESS SYSTEM

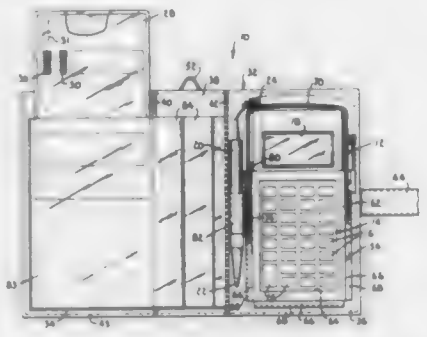
Simon Barakat, Andresy, France, assignor to Schlumberger Industries, Paris, France

Filed Jul. 7, 1988, Ser. No. 215,959
Claims priority, application France, Jul. 7, 1987, 87 09604
Int. Cl.[5] G06K *7/00; G07G 1/14*
U.S. Cl. 235—382 11 Claims

1. A computer implemented method of protecting a selective access system against fraudulent use of at least one access means from among a plurality of access means each having a confidential code associated therewith, the method comprising the steps of:
obtaining the result of a verification of the validity of a confidential code specified by a user of an access means on each occasion that an access means is presented to the selective access system, said result being interpreted as a success if the code is valid and as a failure otherwise;
using a memory to store a trace of failures observed for a plurality of occasions on which access means are presented to the selective access system, said failures being stored by defining a plurality of memory zones in said memory and by assigning each of the access means presented to the selective access system to a class taken from a set of classes corresponding, respectively, to said plurality of memory zones, the number of classes in said set of

classes being less than the number of said access means, and by keeping a count in each of said plurality of memory zones of the number of failures associated with presented access means belonging to the class corresponding to such memory zone;

detecting when the number of failures recorded in any of the memory zones exceeds a first predetermined limit number assigned to such memory zone; and



generating a signal indicative of an attempted fraud when it is detected that the number of failures in any of the memory zones exceeds said first predetermined limit number assigned to such memory zone.

5,006,699

SYSTEM FOR COLLECTING MEDICAL DATA

Donald J. Felkner, 15807 W. 136th St., Olathe, Kans. 66062, and James R. Famuliner, 1010 S. 49th St. Dr., Blue Springs, Mo. 64015

Filed Nov. 13, 1987, Ser. No. 120,367
Int. Cl.[5] G06K *7/10*
U.S. Cl. 235—472 **18 Claims**

1. A data collection system comprising:

a portable data terminal unit having a key pad for data input thereto and a cord carrying a scanning wand for reading and entering into the unit bar coded data;

a carrying case having first and second panels connected to fold between open and closed positions in the manner of a book;

a pocket on said first panel for receiving and holding said terminal unit, said pocket having a front face presenting an opening through which the keypad is exposed and accessible when the terminal unit is in said pocket;

releasable means for securing said terminal unit in said pocket, said releasable means comprising a strap on said pocket and means for releasably securing said strap in extension over the terminal unit to hold the terminal unit in said pocket;

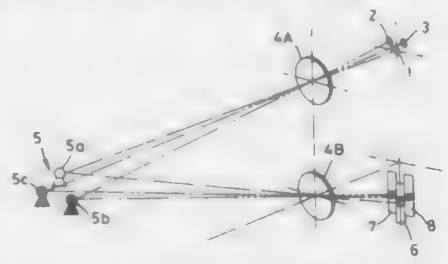
means of maintaining said wand in a storage position in the carrying case; and

means on said carrying case for holding a document having bar coded data thereon at a location wherein the bar coded data is accessible to be scanned by said wand while the terminal unit is in said pocket.

5,006,700

DISTANCE-MEASURING APPARATUS FOR CAMERA

Toru Kosaka, Zama; Yoshiaki Ohtsubo, Yokohama, and Hiroshi Megaro, Kawasaki, all of Japan, assignors to Nikon Corporation, Tokyo, Japan



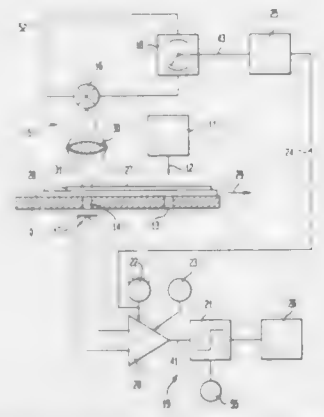
Continuation of Ser. No. 328,435, Mar. 24, 1989, abandoned. This application Aug. 20, 1990, Ser. No. 569,537
Claims priority, application Japan, Apr. 11, 1988, 63-88452
Int. Cl.[5] G01J *1/20*
U.S. Cl. 250—201.4 **8 Claims**

1. A distance-measuring apparatus for a camera, comprising:

first detecting means for detecting a distance to a central portion of an object field;

second detecting means for detecting respective distances to a plurality of peripheral portions of the object field; and

operating means adapted to operate said first and second detecting means, said operating means including means for comparing the detected distance to the central portion of said object field with a predetermined distance, said



operating means operating said second detecting means so as to detect the distances to said plurality of peripheral portions simultaneously when the detected distance to said central portion is less than said predetermined distance, and operating said second detecting means so as to detect the distances to said plurality of peripheral portions sequentially when the detected distance to the central portion of said object field is greater than said predetermined distance.

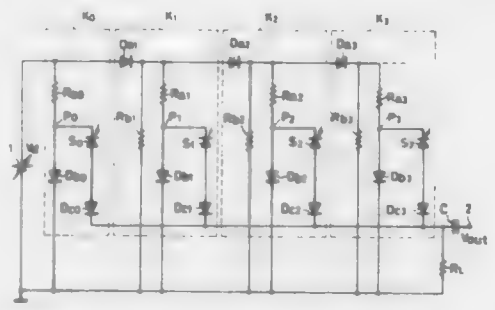
5,006,701

SENSOR SYSTEM WITH SOURCE REGULATION COUPLED TO SENSOR CIRCUIT SENSITIVITY

Karl-Peter Kothe, Beerbacher Str. 15, 6100 Darmstadt-Eberstadt; Manfred W. Gekeler, Pulverhäuserweb 62, 6100 Darmstadt, and Karl-Heinz Meier, 1m Flürchen 1, 6107 Zeilhard, all of Fed. Rep. of Germany

PCT No. PCT/DE88/00603, § 371 Date Jul. 11, 1989, § 102(e) Date Jul. 11, 1989, PCT Pub. No. WO89/03080, PCT Pub. Date Apr. 6, 1989
PCT Filed Sep. 30, 1988, Ser. No. 362,394
Claims priority, application Fed. Rep. of Germany, Oct. 1, 1987, 3733256
Int. Cl.[5] G01J *1/32*
U.S. Cl. 250—205 **16 Claims**

1. Sensor system for regulating machines in dependence on a light barrier comprising a light emitter and a light receiver, an incandescent lamp supplied by an energy source being provided as the light emitter, and an evaluating stage of adjustable sensitivity being connected to the light receiver, characterized in that the energy source of the incandescent lamp is regulated and is coupled with the evaluating stage in such a way that the desired value of the regulated energy source is automatically



adjustable in dependence on the sensitivity setting of the evaluating stage.

5,006,702

SCANNING CIRCUIT DEVICE WITH SAWTOOTH VOLTAGE SOURCE

Hiromi Kakinuma, and Hideo Iida, both of Takasaki, Japan, assignors to Taiyo Yuden Co., Ltd., Tokyo, Japan

PCT No. PCT/JP89/00782, § 371 Date Mar. 12, 1990, § 102(e) Date Mar. 12, 1990, PCT Pub. No. WO90/01846, PCT Pub. Date Feb. 22, 1990
PCT Filed Jul. 28, 1989, Ser. No. 474,774
Claims priority, application Japan, Jul. 30, 1988, 63-190848
Int. Cl.[5] H01J *40/14*
U.S. Cl. 250—208.1 **9 Claims**

1. A scanning circuit device comprising:

a voltage source (1) for generating a sawtooth wave;

a first series circuit connected to a first terminal of the voltage source and having a plurality of diodes (Da_1–Da_3) interconnected in series, each diode having a first and a second electrode, with the first electrode disposed toward the voltage source, the diodes being so oriented as to be forward biased by the sawtooth wave;

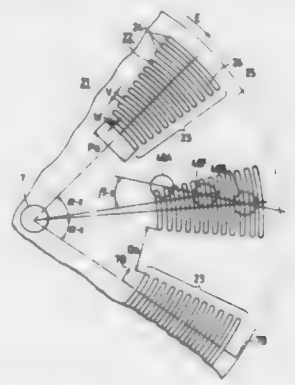
a plurality of second series circuits each having a resistor (Ra_1–Ra_3) and a diode (Db_1–Db_3) interconnected in series, the second series circuits being connected one between the second electrode of each diode of the first series circuit and a second terminal of the voltage source, the diodes of the second series circuit being so oriented as to be forward biased by the sawtooth wave;

a plurality of resistors (Rb_1–Rb_3) connected one between the second electrode of each diode of the first series circuit and the second terminal of the voltage source; and

a plurality of scanned circuit elements (S_1–S_3 or L_1–L_3) connected substantially in parallel with the respective diodes of the second series circuits.

5,006,703

REFLECTIVE OPTICAL ROTARY ENCODER DISC



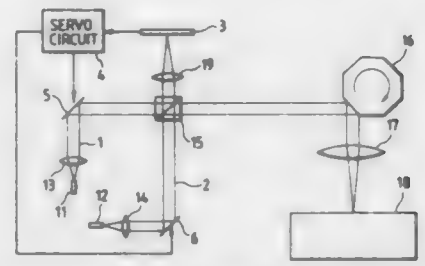
Juichi Shikunami, Kanagawa; Makoto Itonaga, Yokohama; Kanji Kayanuma, Hatano; Masakatsu Kai, Yokohama, and Nobuaki Nakamura, Fujieda, all of Japan, assignors to Victor Company of Japan, Ltd., Yokohama, Japan

Continuation-in-part of Ser. No. 313,672, Feb. 22, 1989, Pat. No. 4,929,822. This application Oct. 24, 1989, Ser. No. 427,203
Claims priority, application Japan, Oct. 24, 1988, 63-267814
Int. Cl.[5] G01D *5/34*
U.S. Cl. 250—231.13 **3 Claims**

1. A reflective optical rotary encoder disc for use in a reflective optical rotary encoder device for detecting an angular speed or position of a movable member with a light beam applied to and reflected from the reflective optical rotary encoder, said reflective optical rotary encoder disc comprising:

an annular rotary encoder track for reflecting the light beam, said rotary encoder track being composed of an annular pattern of angularly spaced pit units each including a plurality of radially spaced arcuate pits; and

a pit-free annular focus servo track for focusing the light beam onto the rotary encoder track, said focus servo track



extending along and being disposed radially substantially centrally in said annular rotary encoder track.

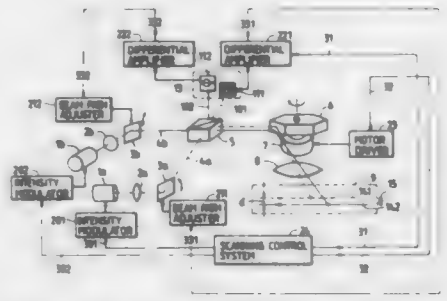
5,006,704

OPTICAL SCANNER AND METHOD FOR GENERATING AND DETECTING A COMPOSITE DOT ON A SCANNING MEDIUM

Takeshi Mochizuki; Shigenobu Katagiri; Minoru Seino; Minoru Ohshima; Susumu Saito, and Akira Arimoto, all of Ibaraki, Japan, assignors to Hitachi Koki Co., Ltd. and Hitachi Ltd., Tokyo, both of, Japan

Filed Oct. 5, 1989, Ser. No. 418,363
Claims priority, application Japan, Oct. 19, 1988, 63-261502
Int. Cl.[5] G01J *1/32*; H01J *3/14*
U.S. Cl. 250—235 **6 Claims**

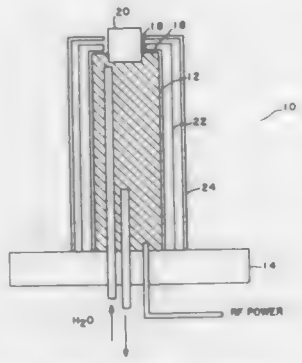
3. A method of scanning a medium comprising the steps of:



generating a plurality of light beams;

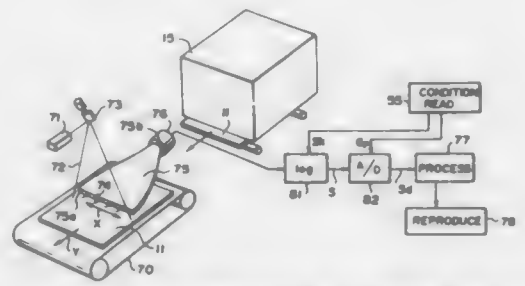
deflecting said light beams and converging said beams onto said medium to form a composite circular spot;

detecting the relative positions of said beams forming said spot on said medium and producing an output indicating said relative positions; and



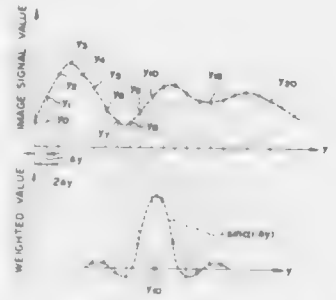
changing the diameter of said composite circular spot by changing the relative positions of said beams in response to said output.

5,006,705
LIGHT BEAM SCANNING APPARATUS WITH CONTROLLER FOR VARYING SPACING BETWEEN A PLURALITY OF SCANNING BEAMS
Susumu Saito, Hachioji; Akira Arimoto, Kodaira; Takeshi Mochizuki, Mito; Yasuyuki Tsuji, Katsuta; Minoru Ohshima, Katsuta, and Minoru Seino, Katsuta, all of Japan, assignors to Hitachi, Ltd. and Hitachi Koki Co., Ltd., both of Tokyo, Japan
Filed Aug. 7, 1989, Ser. No. 390,400
Claims priority, application Japan, Aug. 12, 1988, 63-199909
Int. Cl.[5] H01J 3/14
U.S. Cl. 250—235 45 Claims



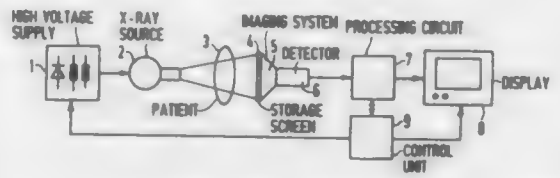
1. A light beam scanning apparatus for recording information to be recorded, comprising:
a plurality of light sources generating a plurality of beams;
intensity modulators changing intensity of the beams from said light sources in accordance with the information to be recorded;
a scanner scanning said beams in parallel on a scanned plane;
adjusters adjusting the relative positions of said beams on said scanned plane; and
a controller controlling at least one of said adjusters so that the relative positions of said beams on said scanned plane vary between at least two different relative positions in accordance with corresponding different pixel densities of the information.

5,006,706
ANALYTICAL METHOD AND APPARATUS
R. Kenneth Marcus, Clemson, S.C., assignor to Clemson University, Clemson, S.C.
Filed May 31, 1989, Ser. No. 359,157
Int. Cl.[5] H01J 49/04
U.S. Cl. 250—288 26 Claims



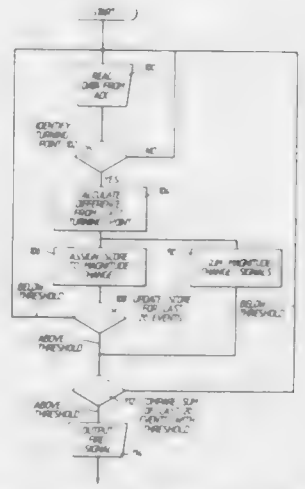
1. A method for analyzing sample materials in the solid state, comprising:
initiating a low pressure glow discharge by applying a radio frequency potential between a solid sample cathode and an anode in the presence of an inert gas;
maintaining the glow discharge such that the inert gas is ionized and the ionized gas sputters substantially only sample material;
passing the sputtered sample material into an analyzer region; and
analyzing the sputtered sample material.

5,006,707
ELECTRON MICROSCOPE IMAGE RECORDING AND READ-OUT METHOD
Nobufumi Mori; Masahiro Ohnishi; Junji Miyahara, all of Kanagawa; Tetsuo Oikawa, and Yoshiyasu Harada, both of Tokyo, all of Japan, assignors to Fuji Photo Film Co., Ltd. and Jeol Ltd., both of Tokyo, Japan
Filed Jan. 19, 1990, Ser. No. 467,479
Claims priority, application Japan, Jan. 24, 1989, 1-14770
Int. Cl.[5] H01J 37/147, 37/26
U.S. Cl. 250—311 13 Claims



1. An electron microscope image recording and read-out method wherein each of a plurality of two-dimensional sensors capable of storing energy from an electron beam thereon is exposed to an electron beam, which has passed through a sample, in a vacuum in order to store the energy from the electron beam on a respective two-dimensional sensor, thereafter the respective two-dimensional sensor is exposed to light or heat in order to release the stored energy as emitted light, and the emitted light is photoelectrically detected in order to obtain an image signal which represents an electron microscope image of the sample,
wherein the improvement comprises the steps of:
(i) for each of said plurality of two-dimensional sensors, determining read-out conditions, which are to be used in the course of detecting the emitted light, on the basis of an electron beam exposure amount which was set in the course of storing the energy from said electron beam on said two-dimensional sensor,
(ii) storing signals, which represent the read-out conditions determined from the respective two-dimensional sensors, in a storage means so that said read-out conditions clearly correspond to which two-dimensional sensor, and
(iii) in the course of exposing a two-dimensional sensor to light or heat and detecting the light emitted by said two-dimensional sensor, reading a signal, which represents the read-out conditions corresponding to said two-dimensional sensor, from said storage means, and setting said read-out conditions when the light emitted by said two-dimensional sensor is being detected.

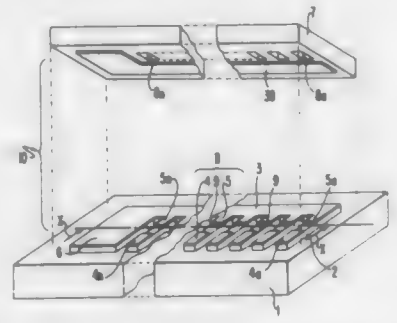
5,006,708
METHOD FOR GENERATING RADIATION IMAGE SIGNALS
Wataru Itoh; Nobuyoshi Nakajima, and Takefumi Nagata, all of Kanagawa, Japan, assignors to Fuji Photo Film Co., Ltd., Kanagawa, Japan
Filed Sep. 15, 1989, Ser. No. 407,823
Claims priority, application Japan, Sep. 16, 1988, 63-231845; Apr. 6, 1989, 1-87708
Int. Cl.[5] G01N 23/04; G03B 42/02
U.S. Cl. 250—327.2 6 Claims
1. A method for generating a radiation image signal wherein a radiation image which has been recorded on a recording medium is read out at predetermined sampling intervals in order to obtain an image signal,
the method for generating a radiation image signal comprising the steps of:
(i) in the course of said radiation image being read out, applying sampling intervals corresponding to a second spatial frequency fsw higher than a first spatial frequency fss, which is the maximum of a desired spatial frequency range, along at least one direction on said



recording medium in order to obtain an original image signal,
(ii) subjecting said original image signal to filtering processing in order to transmit spatial frequency components below said first spatial frequency fss, and to reduce or eliminate spatial frequency components above said first spatial frequency fss, and
(iii) sampling the original image signal, which has been obtained from said filtering processing, at sampling intervals corresponding to said first spatial frequency fss in order to obtain an image signal.

5,006,709
X-RAY DIAGNOSTICS INSTALLATION
Rudolf Schiteenheim, Erlangen, Fed. Rep. of Germany, assignor to Siemens Aktiengesellschaft, Berlin and Munich, Fed. Rep. of Germany
Filed Nov. 6, 1987, Ser. No. 117,573
Claims priority, application Fed. Rep. of Germany, Jan. 28, 1987, 3702512
Int. Cl.[5] G03B 42/02
U.S. Cl. 250—327.2 6 Claims

1. An x-ray diagnostics installation for examining a patient comprising:
means for generating x-radiation directed at said patient;
a luminescent storage screen on which x-radiation attenuated by said patient is incident, said storage screen being capable of spontaneous and stimulated emission of light corresponding to an x-ray image of said patient;
means for reading-out the image from said storage screen by exciting said storage screen with stimulating radiation;
means for detecting light emitted by said storage screen;
means for imaging light from said storage screen onto said means for detecting light, said storage screen, said means for imaging, and said means for detecting light being combined in a single unit;
an image memory in which signals from said means for detecting light are stored picture element-by-picture element;
means for controlling entry of signals into said image memory, said means for controlling entering first signals from said means for detecting light, resulting from spontaneous emission of said storage screen, into said image memory during an exposure of said patient with x-radiation, and thereafter entering second signals from said means for detecting light, resulting from stimulated read-out of said storage screen, in said image memory, and overlaying said first and second signals picture element-by-picture element; and
means for displaying an image of the overlaid first and second signals.



5,006,710
RECOGNITION AND PROCESSING OF WAVEFORMS
Brian D. Powell, Maidenhead, England, assignor to Detector Electronics Corporation, Minneapolis, Minn.
Filed Oct. 12, 1989, Ser. No. 420,271
Int. Cl.[5] G01J 5/02
U.S. Cl. 250—340 7 Claims

1. A system for processing signals so as to discriminate in favor of certain types of signal and against other types, comprising
means for identifying successive turning points of a signal,
means for measuring the changes in magnitude between said successive turning points of the signal,
comparing means for comparing each such magnitude change with the immediately preceding such magnitude change, and
processing means responsive to the successive comparisons to discriminate against those produced when the signal is substantially regularly varying or includes changes which are substantially of step form, and in favor of those corresponding to a substantially randomly varying signal.

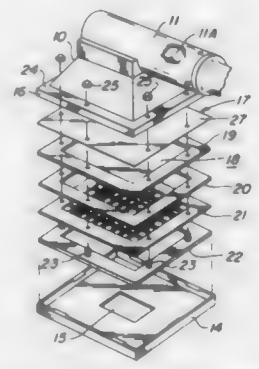
CATOPTRIC DIFFERENTIAL SENSING DEVICE
Hans J. Keller, Staefe, Switzerland, assignor to Eltec Instruments, Inc., Daytona Beach, Fla.
Filed Oct. 8, 1987, Ser. No. 105,896
Int. Cl.[5] G01J *5/08*
U.S. Cl. 250—353 3 Claims



1. Apparatus for detecting fluctuations in radiation transmitted through a plurality of spaced apart detection zones arranged in a primary plane, the primary plane passing through a region for receiving radiation from each of the detection zones, said apparatus comprising:

a. sensing means positioned in the receiving region for detecting fluctuations in levels of radiation transmitted to the receiving region;

b. first reflective means for transmitting radiation from each detection zone to said sensing means through a plurality of reflective paths in the primary plane; said first reflective means comprising two substantially parallel opposing planar reflective surfaces each transversely intersecting the primary plane; and

c. second reflective mans optically coupled to said first reflective means for transmitting radiation from each detection zone to said sensing means through a plurality of reflective paths extending outside the primary plane; said second reflective means comprising two convergent and opposing reflective surfaces, each convergent surface being substantially planar and transverse to said parallel reflective surfaces.

ALPHA PROBE
John C. Miller, Horsham; Sudhakar Pandey, Newtown, and Earl M. Pollock, Chalfont, all of Pa., assignors to Nuclear Research Corp., Warrington, Pa.
Filed Sep. 5, 1989, Ser. No. 402,602
Int. Cl.[5] G01T *1/20*
U.S. Cl. 250—361 R 4 Claims

1. A large aperture alpha radiation detector device comprising in combination,

(a) a rectangular single funnel scintillation chamber having a large rectangular mouth area opening where scintillations are generated, and having a substantially smaller neck area opening where the target of a scintillation detector may be disposed to directly view the funnel mouth with no other physical structure disposed between the funnel mouth opening and neck opening and to generate signals in response to viewed scintillations, the inside surface of said scintillation chamber between said mouth opening and neck opening being coated with a highly reflective light dispersive coating.

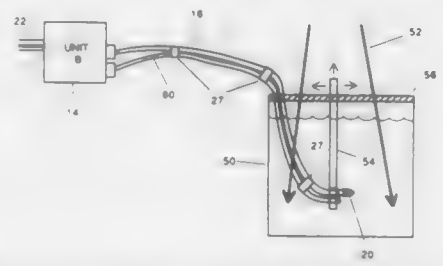
(b) a side window photomultiplier tube scintillation detector disposed in a housing affixed to the neck end of said scintillation chamber with the scintillation detector target disposed as aforesaid at the funnel neck opening,

(c) a flat screen scintillator of substantially the same area as and positioned at the scintillation chamber mouth with its plane substantially orthogonal to the funnel axis, said scintillator being responsive to alpha particles radiation,

(d) a flat window of substantially the same size as, and with its plane parallel spaced closely to, but separated from, said scintillator, and facing the side of said scintillator which faces the mouth of said scintillation chamber, said window being transparent to alpha particles radiation but opaque to light to which said scintillation detector is responsive, and

(e) quick release retainer means operative to securely detachably lock scintillator and flat window to said scintillation chamber across the mouth of and closing said scintillation chamber.

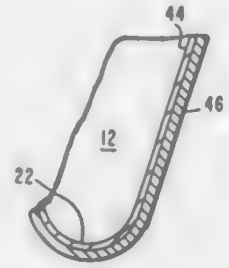
5,006,714
SCINTILLATOR DOSIMETRY PROBE
Frank H. Attix, Madison, Wis., assignor to Radiation Measurements, Inc., Madison, Wis.
Filed Feb. 24, 1989, Ser. No. 315,321
Int. Cl.[5] G01T *1/29*
U.S. Cl. 250—368 8 Claims



1. Apparatus for characterizing a radiation field by measuring the dose-rate at a plurality of points in the radiation field, the apparatus comprising:

a phantom filled with water in the radiation field;

a scintillator positioned in the phantom, the scintillator producing a light output proportional to the dose-rate of radiation that impinges upon the scintillator;



a light pipe having a first end and a second end, the first end being optically connected to the scintillator so that the light pipe conveys the light output from the scintillator;

means connected to the second end of the light pipe and located outside of the phantom for converting light to an output signal proportional to the dose-rate of radiation that impinges upon the scintillator; and

mechanical scanning means for moving the scintillator with the end of the light pipe attached through the interior of the phantom to map the radiation field within the phantom.

5,006,715
ION EVAPORATION SOURCE FOR TIN
Peter B. Back, Canoga Park, Calif.; Mark W. Utlaut, Scappoose, Oreg., and William M. Clark, Jr., Thousand Oaks, Calif., assignors to Hughes Aircraft Company, Los Angeles, Calif.
Filed May 16, 1989, Ser. No. 352,440
Int. Cl.[5] H01J *27/26*
U.S. Cl. 250—423 R 6 Claims

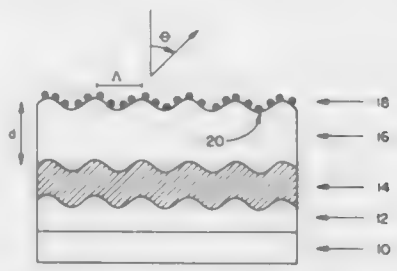
1. A process for preparing an evaporation element for tin, comprising the steps of:

furnishing an ion evaporation source;

coating the evaporation source with gallium; and

loading the evaporation source with tin which includes a fraction of Sn^{120} greater than present in naturally occurring tin.

5,006,716
METHOD AND SYSTEM FOR DIRECTIONAL, ENHANCED FLUORESCENCE FROM MOLECULAR LAYERS
Dennis G. Hall, Pittsford, N.Y., assignor to Research Corporation Technologies, Inc., Tucson, Ariz.
Filed Feb. 22, 1989, Ser. No. 313,763
Int. Cl.[5] G01N *21/62, 21/64*
U.S. Cl. 250—458.1 42 Claims



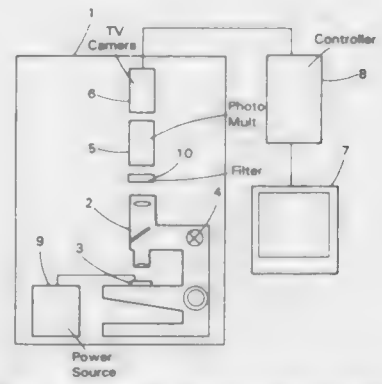
1. A method of enhancing and improving the detection of a fluorescent emitting material comprising the steps of:

(a) depositing a film of a fluorescent emitting material on a waveguide with a corrugated surface which supports propagation modes for optical radiation at the wavelength of absorption by and fluorescence from said fluorescent emitting material,

wherein the waveguide comprises a plurality of layers deposited on a grating, said plurality of layers including a layer of an electrically conductive, light reflective material forming said corrugated surface,

a layer of a dielectric material disposed over the conductive, reflective material, and having a thickness between 20 nanometers and 500 nanometers,

the depositing step including the step of depositing the fluorescent emitting material on the layer of the dielectric material, wherein the dielectric material maintains the



fluorescent emitting material spaced from the conductive, reflective material a distance of between 20 and 500 nanometers,

(b) exciting said fluorescence in said film through the waveguide propagation modes at the wavelength of absorption by said fluorescent emitting material and at discrete angles of emission from the film's normal,

(c) detecting said fluorescence at discrete angles from the film's normal.

5,006,717
METHOD OF EVALUATING A SEMICONDUCTOR DEVICE AND AN APPARATUS FOR PERFORMING THE SAME
Noriko Tsutsu, Osaka; Yoshiro Nakata, Ikoma, and Hideya Esaki, Toyonaka, all of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Osaka, Japan
Filed Dec. 26, 1989, Ser. No. 456,994
Claims priority, application Japan, Dec. 26, 1988, 63-328253
Int Cl.[5] H05B *33/00*
U.S. Cl. 250—484.1 18 Claims

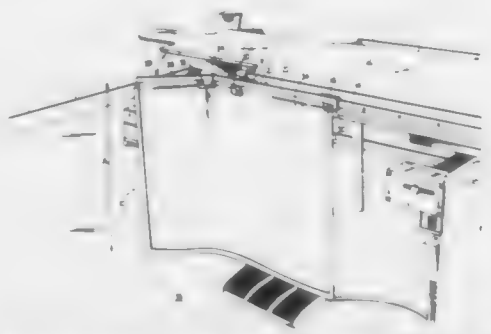
16. An apparatus for evaluating a semiconductor device comprising:

means for obtaining an image of the semiconductor device;

means for operating the semiconductor device;

means for detecting a two-dimensional distribution of at least two kinds of luminescence of different predetermined wavelengths emitted from the operating semiconductor device;

means for calculating a two-dimensional distribution of luminescence of another wavelength which correlates with the degradation of the semiconductor device, from the detected two-dimensional distribution of said at least two kinds of luminescence, using a predetermined expres-



sion; and means for comparing said calculated two-dimensional distribution with said image to determine a place where hot carriers are generated.

5,006,718

X-RAY SHIELD FOR X-RAY EXAMINATION TABLE

Mark J. Lenhart, 10 Partridge La., Burlington, Mass. 01803

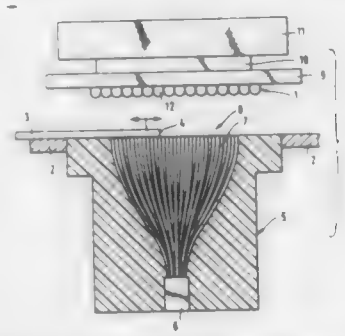
Filed Jul. 21, 1989, Ser. No. 383,201
Int. Cl.[5] G21F *3/00*
U.S. Cl. 250—519.1 5 Claims

1. An X-ray shield for preventing passage of X-rays in front of said shield to a person positioned behind said shield, said shield being adapted for attachment to an X-ray examination table having a horizontally positioned accessory rod adjacent the upper portion of the table, wherein said table is positioned above a floor, and a source of X-rays may cause X-rays to pass between the floor and the table, the shield comprising:

an elongated mounting bar comprising a linear main section and a linear hinge section each fixedly connected together at one end by a hinge, wherein said hinge is constructed and arranged to allow horizontal rotational movement of said linear hinge section above said hinge when said linear main section is fixedly held in a horizontal position.

a mounting bracket fixedly connected to one side of said linear section, said bracket being constructed and arranged to be horizontally slidingly engaged with the accessory rod to hold said mounting bar in a horizontal position adjacent the table, to allow said linear section to be horizontally moved and to allow said horizontal rotational movement of said linear hinge section, and

a drape comprising an X-ray opaque material, fixed at one edge to said mounting bar and extending from said mounting bar substantially the distance said mounting bar is spaced from the floor, said drape being adapted to allow said horizontal rotational movement of said linear hinge section; wherein said drape prevents the passage of X-rays from one side of said drape between the table and the floor and the other side of said drape.



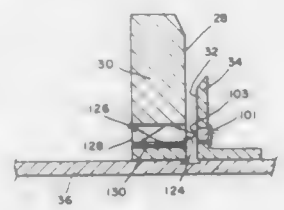
5,006,719

DEVICE FOR DETECTING THE EDGE LOCATION OF AN OBJECT

Peter T. Blaser, Dielheim, Fed. Rep. of Germany, assignor to Heidelberger Druckmaschinen AG, Heidelberg, Fed. Rep. of Germany

Filed Jul. 26, 1989, Ser. No. 385,738
Claims priority, application Fed. Rep. of Germany, Jul. 26, 1988, 3825295
Int. Cl.[5] G01N *21/86*
U.S. Cl. 250—560 9 Claims

1. Device for detecting a position of an edge comprising a row of a multiplicity of light-emitting elements forming an angle with the edge, a single optoelectric transducer disposed adjacent said light emitter elements for receiving light emitted by said light emitting elements, first means for guiding the edge between said row of light-emitting elements and said optoelectric transducer, second means for pulsatingly energizing said light-emitting elements sequentially, and third means for scanning an output voltage of said optoelectric transducer in synchronism with the pulsating energization of said light-emitting elements.



5,006,720

LIGHT SENSOR APPARATUS FOR SHEET TRANSPORT

Dwight G. Westover, Sierra Madre, Calif., assignor to TransTechnology Corporation, Sherman Oaks, Calif.

Division of Ser. No. 225,232, Jul. 28, 1988, Pat. No. 4,927,132.
This application Mar. 27, 1990, Ser. No. 499,961
Int. Cl.[5] G01N *21/86*
U.S. Cl. 250—561 5 Claims

1. In apparatus for receiving a sheet between two spaced apart walls, the improvement comprising:

light emitting and sensing means in one of said walls for emitting light energy and sensing said light energy reflected back from said sheet when interposed between said walls and in the path of said emitted light energy; and

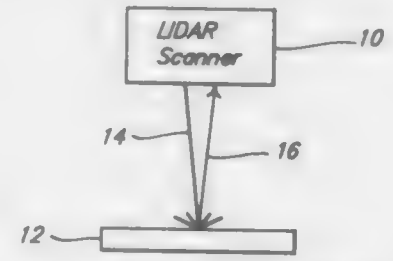
light absorbing means in the other of said walls for absorbing light energy emitted from said light emitting and sensing means when said sheet is not interposed between said light emitting and sensing means and said light receiving means, said light absorbing means including a transparent cylindrical member in said other wall and having a polished end surface for receiving said emitted light energy, said cylinder's other end surface and said cylinder's cylindrical surface being light energy absorbent.

5,006,721

LIDAR SCANNING SYSTEM

Evan S. Cameron, Midland, Canada; Ronald P. Szumski, Raleigh, England, and James K. West, Farmington Hills, Mich., assignors to Perceptron, Inc., Farmington Hills, Mich.

Filed Mar. 23, 1990, Ser. No. 499,068
Int. Cl.[5] G01N *21/86*
U.S. Cl. 250—561 13 Claims



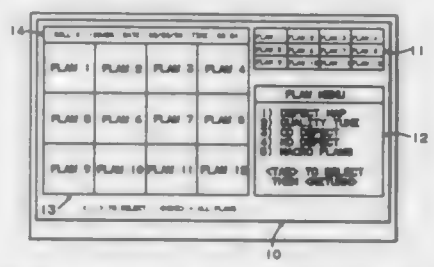
1. A LIDAR scanning system for providing a three-dimensional image of a surface, said system comprising:

a modulated light source;

a light detector;

a rotating multifaceted mirror including a first facet reflecting light emitted from said light source onto said surface, and a second facet receiving diffuse light reflected back from said surface, said diffuse light received by said second facet being reflected to said light detector; and

range determining means for determining the range of said surface relative to a predetermined datum in accordance with the state of modulation of the light received by said light detector relative to the modulated light emitted by said light source, and including zero reference means



comprising a pair of fiber optic light pipes of differing predetermined lengths for receiving light at first terminals thereof located adjacent to said modulated light source and emitting light from second terminals thereof located adjacent to said light detector for providing reference signals to said light detector having known states of modulation.

5,006,722

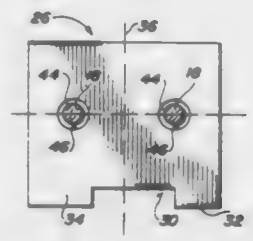
FLAW ANNUNCIATOR WITH A CONTROLLABLE DISPLAY MEANS FOR AN AUTOMATIC INSPECTION SYSTEM

Alexander Adelson, Peekskill, N.Y., assignor to Intec Corp., Trumbull, Conn.

Filed Mar. 2, 1990, Ser. No. 487,570
Int. Cl.[5] G01N *21/88;* G09G *1/28*
U.S. Cl. 250—563 10 Claims

1. A method for detecting flaws in a moving web, comprising the steps of:

detecting each of any of a plurality of different types of flaws in the moving web and generating signals corresponding thereto; and



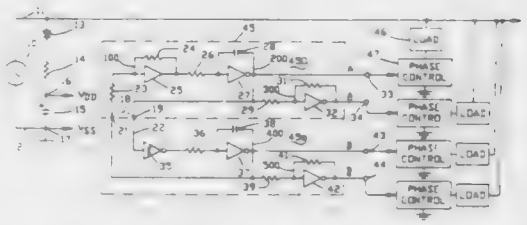
visually indicating when the detected number of flaws for any type of flaw is greater than a preselected threshold value by displaying a matrix of areas each corresponding to one type of the plurality of type of flaws, wherein each area is capable of displaying either of a first and a second color; and controlling the display for each area to initially display the area in the first color and to individually change the color of the area to the second color in response to the detection of a first preselected threshold value of detected flaws of the type corresponding to the area.

5,006,723

ELECTROMAGNETIC DOOR LOCK DEVICE

Arthur Geringer, 5029 E. Jacobs Ct., Agoura, Calif. 91301; Richard Geringer, 2663 Riata Ct., Camarillo, Calif. 93010, and David Geringer, 28364 Balkia, Agoura, Calif. 91301

Filed Apr. 30, 1990, Ser. No. 516,657
Int. Cl.[5] E05C *17/56*
U.S. Cl. 292—251.5 21 Claims



1. In an electromagnetic door lock device having an electromagnet in a housing connected to the underside of the top of a door frame, an armature attracted to the electromagnet only when the latter is energized, the armature being connected to the top of a door hinged in the door frame and movable between a resting unlocked position directly on the top of the door and an upwardly extended locked position adjacent to the underside of the housing when the electromagnet is energized, and locking means including one or a pair of tab plates connected to one or both opposite sides of the housing, each said tab plate having a depending tab adapted to intercept the armature only when the latter is in the upwardly extended position, the improvement which comprises a tab plate having a spaced pair of depending tabs defining a notch therebetween extending upwardly from the bottom thereof, said tabs being disposed unequal distances from the vertical centerline of said plate, and an armature having a protrusion extending outwardly from at least one of the two opposite sides thereof and receivable within said notch only when said armature is in said locked upwardly extended position so as to prevent said door from opening.

5,006,724

CONTROL DEVICE FOR LIGHT SETS

Ching-Chung Liu, No. 6 Lane 29, Pei Yin Street, Hsin-Chu, Taiwan

Filed Mar. 20, 1989, Ser. No. 325,569
Int. Cl.[5] H03K *3/00;* H05B *39/04*
U.S. Cl. 307—11 23 Claims

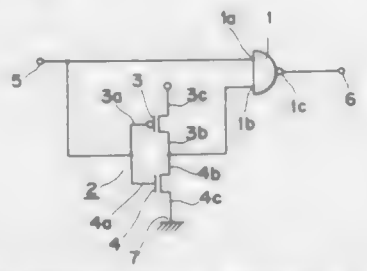
21. A control device for varying the current flow through a load, with the load being a light set of four strings, comprising:

a power supply being defined by a positive side and a negative side;

a function generator having terminals connectable to said power supply and producing at least one output signal of triangular waveform;

power switching means for modulating the current flow through the load in dependence on said triangular output signal of said function generator to attain a gradual increase and decrease of the current flow through the load, said function generator producing four output signals of triangular waveform separated from each other by a quar-

ter period and cooperating with said power switching means,



said power switching means being subdivided into two groups, with one group being coupled to the positive side of said power supply and connected with one end of two such strings of the light set, and with the other group being coupled to the negative side of said power supply and connected to one end of the other two such strings of the light set.

5,006,725

PULSE GENERATOR FOR USE IN AN INTEGRATED CIRCUIT

Masaru Nawaki, and Yasuo Torimaru, both of Nara, Japan, assignors to Sharp Kabushiki Kaisha, Osaka, Japan

Filed May 5, 1989, Ser. No. 347,711
Claims priority, application Japan, May 13, 1988, 63-117944
Int. Cl.[5] H03K *3/07*
U.S. Cl. 307—106 2 Claims

1. A pulse generating unit for generating an output signal having a predetermined pulse duration comprising:

delay means, coupled to a pulse signal input, for outputting a delayed-inverted pulse signal in which only pulse falling edges are delayed, said delay means comprised of only a single P-channel/N-channel MOS-FET pair inverter circuit, the transistor gain of said N-channel MOS-FET smaller than the transistor gain of said P-channel MOS-FET; and

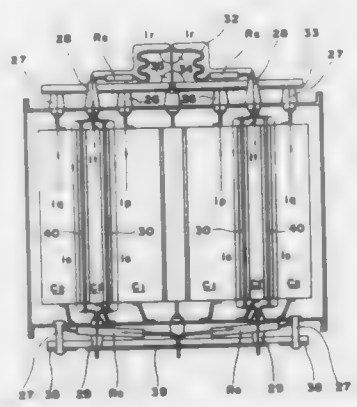
comparator means, for comparing said pulse signal input with said delayed-inverted pulse signal and for outputting the output signal having the predetermined pulse duration, said comparator means comprised of a dual input NAND gate unit, the predetermined pulse duration of the output signal of said comparator means has the same length as that of the delay time of said single P-channel/N-channel MOS-FET pair inverter circuit.

5,006,726

PULSE GENERATOR INCLUDING COAXIAL TYPE CAPACITOR

Mitsunao Okumura, Nagaokakyo, Japan, assignor to Murata Manufacturing Co., Ltd., Japan

Division of Ser. No. 171,559, Mar. 22, 1988, Pat. No. 4,843,518.
This application May 8, 1989, Ser. No. 348,811
Claims priority, application Japan, Mar. 23, 1987, 62-042928[U]; Dec. 21, 1987, 62-194342[U]
The portion of the term of this patent subsequent to Jun. 27, 2006, has been disclaimed.
Int. Cl.[5] H03K *3/537*; H01G *4/38*
U.S. Cl. 307—108 39 Claims



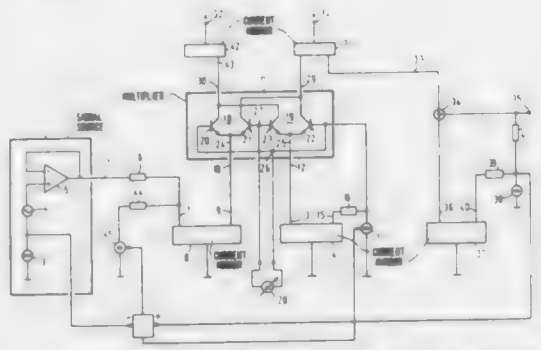
1. A pulse generator comprising a coaxial type capacitor, said capacitor including at least a first capacitor which discharges a charge accumulated therein when a pulse is generated and a second capacitor which adjusts a waveform of a pulse to be outputted,

wherein said coaxial type capacitor includes at least said first and second capacitors, and also a third capacitor, said three capacitors being arranged coaxially and adjacently with each other,

wherein said first and third capacitors between which said second capacitor is arranged are connected in parallel so as to form the discharging capacitor of the pulse generator, said second capacitor being the waveform adjusting capacitor, and

wherein currents in said first and third capacitors flow in an opposite direction to that of a current in said second capacitor when a pulse is generated; and further comprising:

charging and switching means for charging and discharging said first capacitor and thereby forming an output current pulse of said pulse generator.



5,006,727

CIRCUIT ARRANGEMENT FOR ADJUSTING THE AMPLITUDE OF A SIGNAL

Ernst P. Ragosch, Hamburg, and Henning Schwarz, Reinbek, both of Fed. Rep. of Germany, assignors to U.S. Philips Corporation, New York, N.Y.

Filed Oct. 16, 1989, Ser. No. 421,870
Claims priority, application Fed. Rep. of Germany, Oct. 19, 1988, 3835499
Int. Cl.[5] H03K *5/00*
U.S. Cl. 307—264 15 Claims

1. A circuit arrangement for adjusting the amplitude of a signal comprising:

first and second differential transistor amplifiers having cross-coupled control terminals and having two cross-coupled main current path outputs,

a signal source,

a first current mirror circuit coupled to said signal source and to a main current path input of one of said amplifiers to apply to said input the signal whose amplitude is to be adjusted,

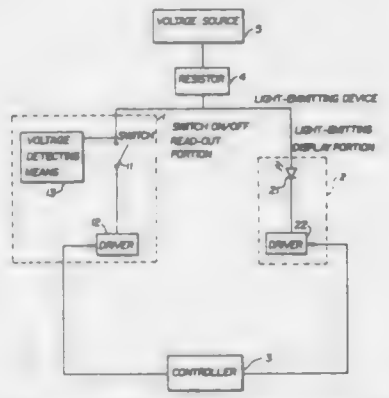
a supply voltage source,

a second current mirror circuit coupled to said supply voltage source and to main current path input of the other one of said amplifiers to apply to said latter input a supply direct current corresponding to a d.c. component of said signal,

means for applying a control voltage to the cross-coupled terminals of the differential amplifiers in order to adjust the amplitude of said signal, whereby the amplitude adjusted signal appears on said two cross-coupled main current path outputs,

a current summing circuit coupled to said two-cross-coupled outputs,

a further voltage source, and



a third current mirror circuit coupled to said further voltage source and to said current summing circuit whereby said current summing circuit substracts an output direct current corresponding to the supply direct current from the amplitude adjusted signal.

5,006,728

DUAL PATH POWER SUPPLY CIRCUIT WITH TIME CONTROLLED SWITCHING

Mikio Yonekura, and Hiroyuki Tojo, both of Hachioji, Japan, assignors to Fanuc Ltd., Yamanashi, Japan

Continuation of Ser. No. 265,861, Oct. 13, 1988, abandoned. This application Apr. 23, 1990, Ser. No. 511,897
Claims priority, application Japan, Feb. 14, 1987, 62-30676
Int. Cl.[5] H03K *3/01*
U.S. Cl. 307—296.10 2 Claims

1. A power supply circuit being connected to a power source through a resistance, said supply circuit comprising:

a first current path including,

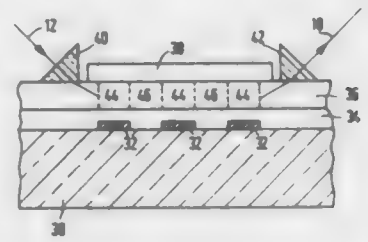
(a) a first switching means connected to said resistance and for active operation by receiving power for a first predetermined time period, and

(b) a first driver circuit means, connected to said first switching means for controlling current flow through said first current path;

a second current path including,

(a) a light emitting display device connected to said resistance and operated to be active by receiving power for a second predetermined time period, and

(b) a second driver circuit means, connected to said light emitting display device, for controlling current flow through said current path; and



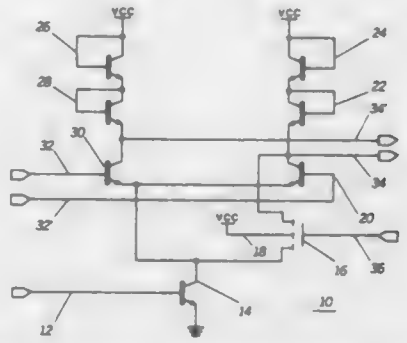
a driver circuit controller means, connected to said first and second driver circuit means, for controlling said first and second driver circuits such that power is alternately supplied between said first and second current path to operate said first switching means for the first predetermined time period and subsequently power is applied to said second current path to operation aid light emitting display device for the second predetermined time period.

5,006,729

DEVICE FOR DOUBLING THE FREQUENCY OF A LIGHT WAVE COMPRISING A NON-LINEAR OPTICAL COMPOUND

Egbert W. Meijer, Eindhoven; Wolter Ten Hoeve, Eelde; Sjef Nijhuis, Eindhoven; Gerardus L. J. A. Rikken, Eindhoven, and Edsko E. Havinga, Eindhoven, all of Netherlands, assignors to U.S. Philips Corporation, New York, N.Y.

Filed Apr. 24, 1990, Ser. No. 513,743
Claims priority, application Netherlands, Apr. 27, 1989, 8901069
Int. Cl.[5] H03F *7/00*; G02B *6/00*; C08F *26/06*; B32B *9/04*
U.S. Cl. 307—425 5 Claims



1. A device for doubling the frequency of a light wave, in which a fundamental red light wave is passed through a nonlinear optical medium, so as to form a second harmonic blue light wave, which nonlinear optical medium comprises a nonlinear optical compound, comprising an electron donor group an an electron acceptor group which are linked by a π-conjugated system, in which the electron acceptor group is a sulphone group containing a substituent selected from the group consisting of alkyl, hydroxyalkyl and alkyl(meth)acrylate moieties and in which the compound π-conjugated system is a biphenylene group.

5,006,730

BIMOS LOGIC GATES

Darrell E. Davis, Sunrise, Fla., assignor to Motorola, Inc., Schaumburg, Ill.

Continuation of Ser. No. 345,753, May 1, 1989, abandoned. This application Sep. 21, 1990, Ser. No. 586,321
Int. Cl.[5] H03K *19/02*, *19/086*, *19/0175*
U.S. Cl. 307—446 42 Claims

1. A BIMOS logic gate for receiving external ECL level input signals and external MOS level input signals and for providing ECL level output signals, comprising:

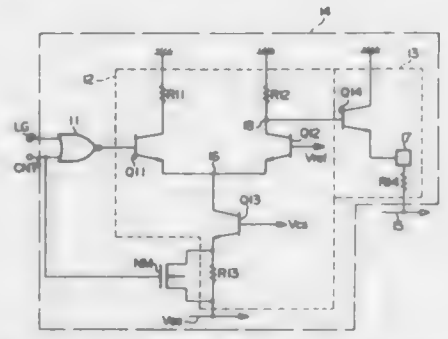
bias means for providing a bias current;

first and second loads coupled to a voltage source;

a MOS transistor, disposed between said bias means and said first load;

first and second bipolar transistors, each transistor having first, second, and third ports, said first bipolar transistor arranged such that its first port is coupled to said first load, its second port is coupled to a complementary ECL level input, and its third port is coupled to said bias means, said

second bipolar transistor being arranged such that its first port is coupled to said second load, its second port is coupled to an ECL level input, and its third port is coupled to said bias means;



whereby, said MOS transistor receives only a single external MOS input signal, and the second ports of said first and second bipolar transistors receive input signals, said first ports of said bipolar transistors provide complementary output signals.

5,006,731

THREE STATE EMITTER COUPLED LOGIC CIRCUIT WITH A SMALL AMOUNT OF CURRENT CONSUMPTION

Akira Denda, Tokyo, Japan, assignor to NEC Corporation, Tokyo, Japan

Filed Oct. 2, 1989, Ser. No. 416,116
Claims priority, application Japan, Oct. 6, 1988, 63-252681
Int. Cl.[5] H03K *19/02, 3/01, 17/60*
U.S. Cl. 307—455 8 Claims

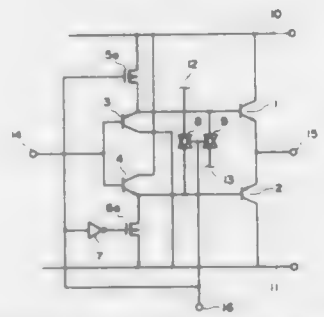
1. A three state emitter coupled logic circuit shifted between a logical function mode and a high impedance state, comprising:

(a) a logic circuit responsive to an input logic signal and a three state control signal and operative to produce an internal logic signal;

(b) a difference circuit having a first series combination of a first resistor and a first bipolar transistor coupled between a first constant voltage source and a common mode, a second series combination of a second resistor and a second bipolar transistor coupled in parallel to the first series combination between the first constant voltage source and the common node, a third series combination of a third bipolar transistor and a third resistor coupled between the common node and a second constant voltage source, said first, second and third bipolar transistors being supplied at the respective base nodes thereof with the internal logic signal, a reference voltage level and a current source signal, respectively;

(c) an output circuit having a fourth series combination of a fourth bipolar transistor, an output node and a fourth resistor coupled between the first constant voltage source and an output signal line, said fourth bipolar transistor being coupled at the base node thereof to an intermediate node provided between said second bipolar transistor and said second resistor; and

(d) a bypassing circuit providing a current path bypassing said third resistor in the presence of said three state control signal of an active voltage level for establishing said three state emitter coupled logic circuit in said high impedance state, said current path being blocked in the presence of said three state control signal of an inactive voltage level for establishing said three state emitter coupled logic circuit in said logic function mode, said first constant voltage source and said second constant voltage source respectively producing a ground voltage level and a negative voltage level.



wherein said first, second, third and fourth bipolar transistors are of the n-p-n type and said bypassing circuit is formed by an n-channel type field effect transistor having a gate electrode supplied with said three state control signal.

5,006,732

SEMICONDUCTOR CIRCUIT HAVING BUFFER FUNCTION

Hiroyuki Nakamura, Isehara, Japan, assignor to Canon Kabushiki Kaisha, Tokyo, Japan

Filed May 22, 1989, Ser. No. 354,757
Claims priority, application Japan, May 25, 1988, 63-125950
Int. Cl.[5] H03K *19/00*
U.S. Cl. 307—473 5 Claims

1. A semiconductor circuit having a buffer function comprising:

an input terminal for inputting a signal;

an output terminal for outputting a signal corresponding to the signal input by the input terminal;

a control signal input terminal for inputting a control signal to control whether said signal corresponding to the signal input by said input terminal is output from said output terminal or not;

a first transistor whose collector is connected to one terminal of a power supply and whose emitter is connected to an emitter of a second transistor and whose base is connected to an emitter of a third transistor;

a collector of the second transistor is connected to another terminal of the power supply and the base of the second transistor is connected to an emitter of a fourth transistor;

a first current device in which one of terminals is connected to the one terminal of the power supply and the other terminal is connected to the emitter of the third transistor and which is turned on or off by said control signal;

a collector of the third transistor is connected to the other terminal of the power supply;

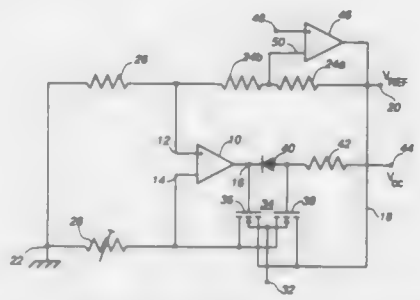
a collector of the fourth transistor is connected to the one terminal of the power supply and the emitter of the fourth transistor is connected to one of a pair of terminals of a second current device;

the other terminal of the second current device is connected to the other terminal of the power supply;

the second current source is turned on or off by said control signal;

wherein said input terminal is connected to bases of the third and fourth transistors and said output terminal is connected to the emitters of the first and second transistors.

5,006,733



FILTER CONTROL CIRCUIT

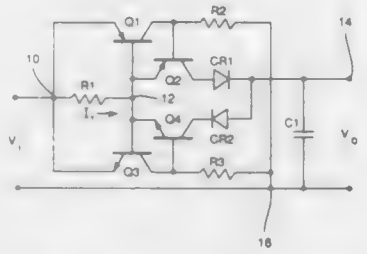
Anthony K. D. Brown, Kanata, Canada, assignor to Northern Telecom Limited, Montreal, Canada

Filed May 11, 1990, Ser. No. 522,020
Int. Cl.[5] H03K *5/00, 3/01*
U.S. Cl. 307—521 13 Claims

1. A filter control circuit, comprising:

a resistance bridge circuit having first, second, third and fourth resistance arms, a first junction point between the first and second resistance arms, a second junction point between the first and third resistance arms, a third junction point between the first and second resistance arms, and a fourth junction point between the third and fourth resistance arms;

comparator means having a first input connected to the third junction point and a second input coupled to the fourth junction point and an output;



the fourth resistance arm including field effect transistor means having a plurality of gates connected to the output of the comparator means, each gate having a width different from each other gate.

5,006,734

BIDIRECTIONAL CURRENT LIMITING CIRCUIT

Dennis R. Engelbrecht, Corvallis, Oreg., assignor to Hewlett-Packard Company, Palo Alto, Calif.

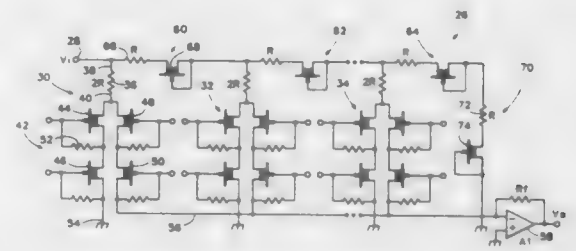
Filed Jan. 31, 1990, Ser. No. 472,986
Int. Cl.[5] H03K *5/08*
U.S. Cl. 307—544 19 Claims

1. A bidirectional current limiting circuit for limiting the current through the circuit to a maximum, comprising:

a first pair of bipolar junction transistors, each transistor having its emitter coupled to a first node and its base coupled to a second node;

resistance means for carrying the current to be limited, the resistance means connected between the first node and a second node, in parallel with the base-emitter junction of a transistor of the transistor pair; and

a second pair of bipolar junction transistors, each transistor coupled to a second node and to a third node, one transistor including means for allowing current to flow from the third node through the transistor to the second node and the other transistor including means for allowing current to flow from the second node through the transistor to the third node,



each transistor of the first pair controlling a transistor of the second pair to limit the current through the resistance means when a controlling transistor turns on, a controlling transistor turning on if the current through the resistance means in either direction reaches the maximum.

5,006,735

METHOD AND APPARATUS FOR COMPENSATING A SOLID STATE ATTENUATOR

Stewart S. Taylor, Beaverton, Oreg., assignor to TriQuint Semiconductor, Inc., Beaverton, Oreg.

Filed Jan. 23, 1990, Ser. No. 468,508
Int. Cl.[5] H03K *5/08;* H01P *1/22*
U.S. Cl. 307—568 23 Claims

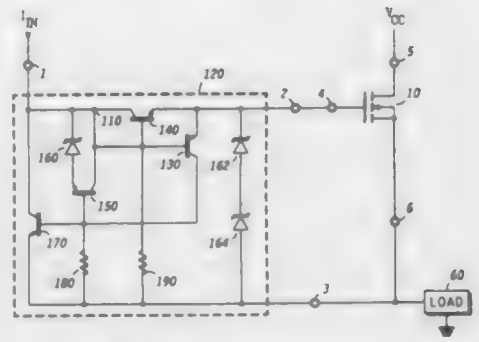
1. A compensated attenuator comprising:

a terminal for applying an input voltage thereto;

a first branch electrically connected to said terminal and having a first resistance therein;

a second branch electrically connected to said terminal and having a second resistance therein;

a first solid state switching device disposed in said first branch for switching current therein between a first path and a second path, said first switching device having a third resistance that is in series with said first resistance;



a second solid state switching device disposed in said second branch, said second switching device being biased into a conducting condition for passing current therethrough and having a fourth resistance, said third and fourth resistances having a first ratio and said first and second resistances having a second ratio equal to the first ratio.

5,006,736

CONTROL CIRCUIT FOR RAPID GATE DISCHARGE

Robert B. Davies, Tempe, Ariz., assignor to Motorola, Inc., Schaumburg, Ill.

Filed Jun. 13, 1989, Ser. No. 365,403
Int. Cl.[5] H03K *17/16*
U.S. Cl. 307—570 8 Claims

1. A control circuit having an input terminal, an output terminal and a reference terminal, for coupling to a switching device, the switching device having a control terminal, a first load terminal for coupling to a source of supply voltage and a second load terminal for coupling to a load, the control circuit comprising:

current supply circuit means coupled between the input terminal and the output terminal and responsive to a current signal applied at the input terminal for providing a current path from the input terminal to the output terminal, said current supply means including a first transistor having a control terminal and first and second load terminals, said first load terminal of said first transistor coupled

to the output terminal, and said control and second load terminals coupled to the input terminal;

zener diode means coupled between the output terminal and the reference terminal for limiting the voltage thereacross;

silicon controlled rectifier means coupled to the input terminal, to the output terminal and to the reference terminal for providing a discharge path from the output terminal to the reference terminal in response to said current signal applied at the input terminal;

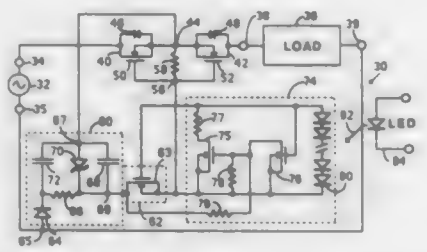
a second transistor having a control terminal and first and second load terminals, said second load terminal of said second transistor being coupled to the input terminal,

said silicon controlled rectifier means including a third transistor having a control terminal and first and second load terminals, said first load terminal of said third transistor being coupled to the reference terminal, said second load terminal of said third transistor being coupled to the input terminal, and said control terminal of said third transistor being coupled to said control terminal of said second transistor;

a first zener diode having cathode and anode terminals, said anode terminal being coupled to said first load terminal of said second transistor, and said cathode terminal being coupled to said second load terminals of said second and third transistors; and

a first resistor having first and second terminals, said first terminal being coupled to said control terminals of said second and third transistors, and said second terminal being coupled to the reference terminal, wherein said current supply circuit means, said zener diode means, said silicon controlled rectifier means, said second transistor, said first zener diode and said first resistor are all contained in a single integrated circuit and wherein the output terminal is for coupling to the control terminal of the switching device and the reference terminals is for coupling to the second load terminal of the switching device.

5,006,737



TRANSFORMERLESS SEMICONDUCTOR AC SWITCH HAVING INTERNAL BIASING MEANS

Gary V. Fay, Scottsdale, Ariz., assignor to Motorola Inc., Schaumburg, Ill.

Filed Apr. 24, 1989, Ser. No. 341,881

Int. Cl.[5] H03K *17/687, 17/60, 3/42, 3/01*

U.S. Cl. 307—571 **20 Claims**

1. A transformerless AC semiconductor switch for coupling AC power to an AC load, comprising:

first and second power input means for receiving power from an AC source;

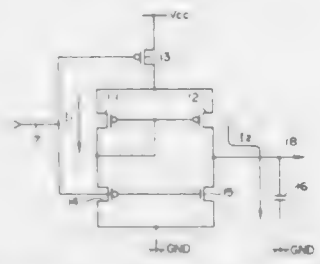
first and second power output means for coupling AC power to a load;

first and second series connected MOSFETS having connected together first power terminals and second power terminals coupled between the first power input means and the first power output means, wherein the MOSFETS have connected together gate electrodes; and

internal voltage bias means coupled between the connected together first power terminals and the connected together gate electrodes of the MOSFETS for providing a gate voltage larger than the threshold voltage of at least one of the power MOSFETS, wherein the internal voltage bias means generates the bias from the first and second power input means without use of a transformer.

5,006,738

DELAY CIRCUIT FOR INTEGRATED CIRCUIT



Hideki Usuki; Shumpei Kohri; Masatoshi Yano, and Hiroshi Ishida, all of Kanagawa, Japan, assignors to Sony Corporation, Tokyo, Japan

Continuation of Ser. No. 263,389, Oct. 27, 1988, abandoned. This application Jun. 13, 1990, Ser. No. 537,868

Claims priority, application Japan, Oct. 31, 1987, 62-276874

Int. Cl.[5] H03K *5/13*

U.S. Cl. 307—594 **15 Claims**

1. A delay circuit for an integrated circuit for producing a predetermined delay time between a signal received at an input and a signal produced at an output, comprising:

a current mirror circuit including at least a pair of current mirror connected MIS transistors, each of said MIS transistors is a PMOS transistor having their sources coupled to source voltage and both gates of said MIS transistors are connected in common;

a constant current source connected between a drain of one of said MIS transistors and ground;

a capacitance connected between a drain of the other of said MIS transistors and ground and being chargeable by current flowing through said other of said MIS transistors, charging time of said capacitance from the current flowing through said other of said MIS transistors determining the predetermined delay time of said delay circuit;

said constant current source comprising a PMOS transistor, and a gate of said PMOS transistor of said constant current source being the input for receiving an input signal;

a NMOS transistor connected to the other of said MIS transistors and in parallel with said capacitance, a gate of said NMOS transistor being connected in common with a gate of said PMOS transistor of said constant current source so that said NMOS transistor switches to a conducting state when said PMOS transistor is in a non-conducting state and visa versa.

5,006,739

CAPACITIVE LOAD DRIVE CIRCUIT

Yuichiro Kimura; Nobuaki Kabuto; Satoru Takashimizu, all of Yokohama, and Katsuhiro Masujima, Kodaira, all of Japan, assignors to Hitachi, Ltd., Tokyo, Japan

Continuation of Ser. No. 206,037, Jun. 13, 1988, abandoned. This application Aug. 15, 1990, Ser. No. 567,703

Claims priority, application Japan, Jun. 15, 1987, 62-146854; Sep. 30, 1987, 62-243705

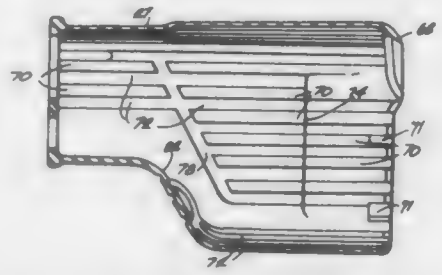
Int. Cl.[5] H03K *3/01, 3/26*

U.S. Cl. 307—270 **8 Claims**

1. A capacitive load drive circuit using a voltage follower in which an SEPP (single-ended push-pull) circuit is connected to an output of a differential amplifier and an output of said SEPP circuit is fed back to an inverting input of said differential amplifier, wherein a non-inverting input of the differential amplifier receives an input signal for the capacitive load drive circuit, wherein the sum of on-voltage values of two bipolar transistors (or two FETs) included in said SEPP circuit is larger than zero, bases (or gates) of said two bipolar transistors (or two FETs) being directly connected together, and wherein said capacitive load drive circuit comprises a current limit circuit provided between the collector of at least one of said two bipolar transistors (or the drain of at least one of said two

FETs) and a positive or negative power supply, and wherein a constant current source is provided between an output terminal of said SEPP circuit and the positive or negative power supply.

5,006,740



INSULATED COOLING BOOT FOR POWER TOOL

Bernhard Palm, Brookfield, Wis., assignor to Milwaukee Electric Tool Corporation, Brookfield, Wis.

Filed Jun. 13, 1990, Ser. No. 537,428

Int. Cl.[5] H02K *7/14, 9/00, 15/14, 7/10*

U.S. Cl. 310—50 **4 Claims**

1. A hand power tool including motor housing having a handle at one end and a gear case at the other end,

a transmission in said gear case, said transmission tending to build up heat,

a motor in said housing and having a shaft driving said transmission,

a fan in said housing driven by said motor,

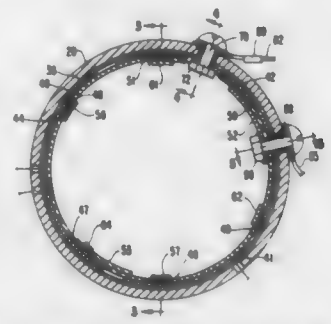
air entry slots in said housing and an air exhaust space between said gear case and said housing so said fan can draw air into said housing through said slots and exhaust it through said space,

an insulating boot fitting over said gear case and projecting partially over said space between the gear case and the housing to divert cooling air flow between said boot and said gear case,

and spaced parallel ribs on the interior of said boot running lengthwise of said boot to channel cooling air flow forward between said boot and said gear case,

said cooling air leaving the space between said boot and said gear case adjacent the front of said power tool to blow on the working area of the tool to remove debris from the working area.

5,006,741



BRUSHLESS GENERATOR WITH CONCENTRICALLY ARRANGED RECTIFIER ASSEMBLY

Edmund A. Schott, Rockford, Ill., assignor to Sundstrand Corporation, Rockford, Ill.

Filed Jul. 6, 1989, Ser. No. 376,011

Int. Cl.[5] H02K *11/00;* **H02M** *1/00*

U.S. Cl. 310—68 D **19 Claims**

1. A brushless self-excited cooled dynamo electric machine comprising:

a main dynamo unit with a rotating DC field producing structure mounted on a hollow shaft, said unit being energized by an exciter dynamo unit having a rotor mounted on the hollow shaft and producing an alternating current;

means for supplying a coolant to the interior of said hollow shaft;

means for rectifying the alternating current to a direct current for supplying current to said DC field comprising a diode assembly including a first annular insulation layer positioned adjacent an internal peripheral surface of the hollow shaft, a first layer of conductive material composed of at least two electrically isolated segments supported by said first insulation layer, a second annular layer of insulation material concentric and supported by said first layer of conducting material which contains openings at spaced locations, a plurality of diodes positioned in the openings of said second layer of insulation material, said diodes each having a cathode surface and an anode surface with some of the diodes having a cathode surface in contact with said first conductive layer and others of said diodes having an anode surface in contact with said first conductive layer, a second layer of conductive material composed of two segments, one segment contacting exposed anode surfaces and one segment contacting exposed cathode surfaces of said diodes whereby stress due to centrifugal force tends to hold the layers together and compress diode chips to reduce the likelihood of diode breakage; and wherein

said layers are mounted as concentric laminates extending around a periphery of an inner wall of said hollow shaft.

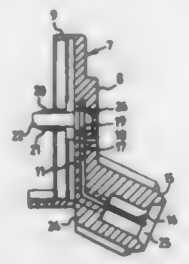
5,006,742

SPLASHPROOF COVER FOR AN ELECTRIC MOTOR

Georg Strobl, Repulse Bay, and Ben T. Wong, Wah Fu, both of Hong Kong, assignors to Johnson Electric S.A., La Chaux de Fonds, Switzerland

Filed Sep. 21, 1989, Ser. No. 410,866

Claims priority, application United Kingdom, Sep. 22, 1988, 8822321



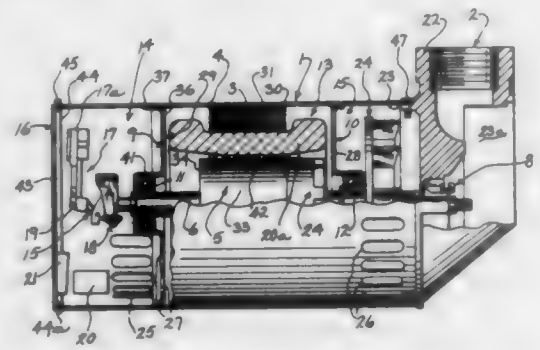
Int. Cl.[5] H02K *5/10*

U.S. Cl. 310—88 **4 Claims**

1. A splashproof cover for a slotted end cap of a motor having a pair of motor terminals protruding through the end cap, the cover comprising:

a generally circular solid molded plastic planar body integrally formed with a socket at one side of the body, tongues extending transversely to the plane of the body

for entering into the slots of the end cap, apertures in the body for receiving the motor terminals, and conductors



insert molded within the body and extending along the plane of the body from each aperture to inside the socket.

5,006,743

MULTIPLE COMPARTMENTED DYNAMOELECTRIC MACHINE

James L. King, and Robert E. Lykes, both of Troy, Ohio, assignors to A. O. Smith Corporation, Milwaukee, Wis.

Filed Oct. 26, 1989, Ser. No. 427,441
Int. Cl.[5] H02K *5/22*
U.S. Cl. 310—89 **2 Claims**

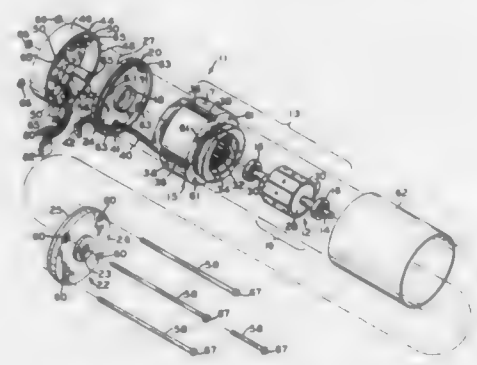
1. An electric motor comprising

an outer tubular round frame formed of self-supporting rigid material,

an annular stator unit having magnetic core secured centrally of said frame, a winding wound in said core and projecting from the core and terminating in inwardly spaced relation to the core, a rotor unit including a magnetic core aligned with said magnetic core of said stator and having a shaft projecting from the opposite ends of said magnetic core of said rotor unit,

first and second bearing frames secured within said round frame to define a motor compartment and including bearings, and said shaft being journaled in said bearings, and

an end wall member secured to the first end of said tubular round frame in spaced relation to the first bearing frame and defining a control compartment adjacent said bearing frame and said motor compartment, and



a second end wall member secured to the second end of said tubular round frame in spaced relation to said second bearing frame and defining an auxiliary compartment, said shaft projecting from said core unit through said auxiliary compartment, and including a pump unit having a pump shaft secured to said motor shaft, said pump unit having an end wall member including a mounting flange projecting into the tubular round frame and defining said second wall member closing the auxiliary compartment, said tubular round frame having openings in alignment with the auxiliary compartment to form a drip compartment for discharge of liquid passing from the pump unit into said compartment.

5,006,744

INTEGRATED ELECTRONICALLY COMMUTATED MOTOR AND CONTROL CIRCUIT ASSEMBLY

William R. Archer; Peter B. Lytle; Rajendra K. Shah, and John E. Wynberry, all of Fort Wayne, Ind., assignors to General Electric Company, Fort Wayne, Ind.

Filed Dec. 27, 1988, Ser. No. 290,031
Int. Cl.[5] H02K *11/00, 5/18, 5/02;* **H02P** *7/06*
U.S. Cl. 310—89 **22 Claims**

1. A motor assembly comprising:

an adapted having first and second opposite sides;

a stationary assembly on the first side of said adapter and having a plurality of winding stages adapted to be electrically energized to generate an electromagnetic field;

a rotatable assembly including a plurality of permanent magnet elements in magnetic coupling relation with said stationary assembly;

control means including power switching devices, said control means connected to the winding stages and positioned adjacent the second side of said adapter, for controlling said power switching devices for applying a voltage to one or more of the winding stages at a time and for commutating the winding stages in a preselected sequence to rotate the rotatable assembly about an axis of rotation;

a cap on the second side of said adapter, said power switching devices disposed on the cap, said cap including means integral with and projecting laterally from the cap and electrically insulated from and in heat exchange relationship with said power switching devices for dissipating heat generated by said power switching devices wherein said adapter is positioned between the stationary assembly and the rotatable assembly on the first side thereof and the control means and the cap on the second side thereof; and

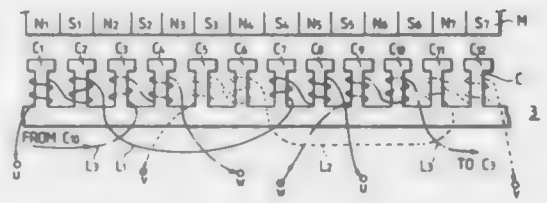
said cap and said adapter forming a closure within which said control means is located.

5,006,745

POLYPHASE DIRECT CURRENT MOTOR

Akira Nishio; Masato Nakamura, both of Fujieda, and Akihiro Mochizuki, Shizuoka, all of Japan, assignors to Victor company of Japan, Ltd., Yokohama, Japan

Filed Aug. 3, 1989, Ser. No. 388,888
Claims priority, application Japan, Aug. 3, 1988, 63-194122; Aug. 3, 1988, 63-194123
Int. Cl.[5] H02K *17/12*
U.S. Cl. 310—177 **5 Claims**



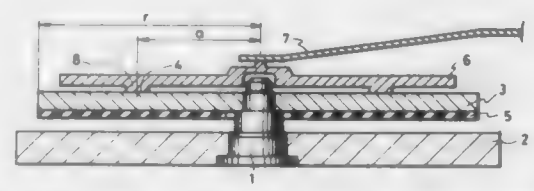
1. A three-phase direct-current motor comprising:

a field magnet having P field poles positioned as a circular array at angularly equally spaced intervals;

an armature having cores as angularly equally spaced N protruding poles providing N slots therebetween the three-phase coils disposed therein;

either said field magnet or said armature being rotatable with respect to the other; and

P and N being defined by $P=2(4n+3)$ and $N=3(2n+1)$ wherein n is an integer of 1 or more, and being selected



such that the least common multiple of N and P is equal to N x P.

5,006,746

TRAVELLING-WAVE MOTOR

Masao Kasuga; Takayuki Mori, and Nobuo Tsukada, all of Tokyo, Japan, assignors to Seiko Instruments Inc., Japan

Filed Dec. 29, 1988, Ser. No. 291,459
Claims priority, application Japan, Dec. 29, 1987, 62-332501; Jan. 9, 1988, 63-1543[U]
Int. Cl.[5] H01L *41/08*
U.S. Cl. 310—323 **33 Claims**

1. A travelling-wave motor utilizing flexible travelling waves generated in a vibrating body for driving a movable body comprising:

a ground way for fixing said travelling motor, said ground way having a supporting means;

a vibrating body secured and supported in such a manner that said vibrating body is integrated with said supporting means;

a piezoelectric vibrator secured to one side of said vibrating body for exciting travelling waves in a primary oscillation mode with respect to the radial direction in said vibrating body;

a movable body provided on said vibrating body;

an annular projection provided on one of said vibrating body and said movable body so that said vibrating body comes into contact with said movable body through the projection at a portion inside of the outermost periphery of said vibrating body; and

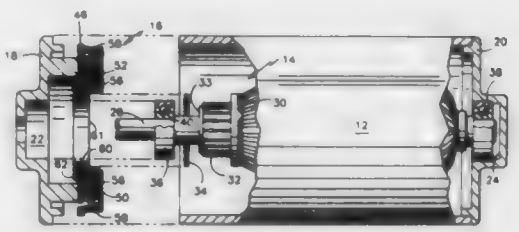
a pressure-regulator provided on said movable body for generating suitable contact pressure between said movable body and said vibrating body.

5,006,747

DYNAMOELECTRIC MACHINE BRUSH RIGGING AND METHOD OF ASSEMBLY

Kenneth W. Stewart, Sr., Columbus, Miss., assignor to United Technologies Motor Systems, Inc., Columbus, Miss.

Filed Apr. 2, 1990, Ser. No. 503,507
Int. Cl.[5] H02K *13/00*
U.S. Cl. 310—239 **13 Claims**



1. In combination,

an armature subassembly for a dynamoelectric machine having armature windings, an armature shaft, a commutator mounted to the armature shaft adjacent the armature windings, an antifriction bearing assembly mounted to the armature shaft in spaced disposition to said commutator, said bearing assembly having an outer diametral dimension greater than said commutator, and actuator means for displacing brush retainer means, said actuator means being positioned between said bearing means and said commutator, and

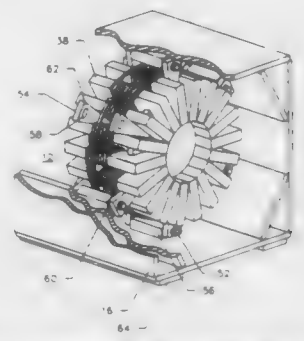
a brushcard subassembly adapted for mounting about the commutator comprising

support means for mounting brush holders radially adjacent the commutator, said support means defining a central opening to receive the commutator, said central opening being larger than the diametral dimension of said bearing assembly so as to permit the bearing assembly to pass therethrough,

at least one of said brush holders mounted to said support means so as to extend radially from a commutator in assembly,

a brush slidably supported in said holder,

spring means for urging said brush into contact with the commutator and



said retainer means for retaining brushes radially outwardly so as to form an unobstructed central passageway greater than the diametral dimension of said bearing assembly to permit the bearing assembly to pass through said passageway and through said central opening of said support means, said retainer means being releasably mounted to said support means for automatic displacement by said actuator means upon placement of the commutator into said central opening of the support means to allow the brush to engage the commutator.

5,006,748

STATOR MOUNTING ARRANGEMENT

Pamela D. Wintermute, Gleamont, N.Y., assignor to REM Technologies, Inc., Albany, N.Y.

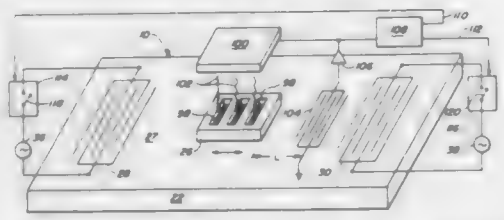
Filed Aug. 17, 1989, Ser. No. 395,032
Int. Cl.[5] H02K *1/12*
U.S. Cl. 310—258 **13 Claims**

1. Apparatus for positioning and mounting a stator within a housing with the stator extending along and about a central longitudinal axis, comprising:

a support structure for the stator, the support structure having a plurality of circumferentially spaced pairs of axially separated radially outwardly projecting extensions, the extensions of each pair having opposed spaced apart axially inner laterally extending faces;

a plurality of mounting supports circumferentially distrib-

uted about the interior of the housing, each mounting support being associated with a different one of the pairs of extensions, each mounting support having a pair of laterally extending axially outer end faces, the end faces of each mounting support being axially spaced apart a distance substantially equal to the axial span between opposed axially inner laterally extending faces of a pair of said extensions associated with the support; and



means for securing the stator within the housing such that said end faces of the mounting supports are sandwiched between the axially inner laterally extending faces of the pairs of extensions.

5,006,749

METHOD AND APPARATUS FOR USING ULTRASONIC ENERGY FOR MOVING MICROMINIATURE ELEMENTS

Richard M. White, Berkeley, Calif., assignor to Regents of the University of California, Oakland, Calif.

Filed Oct. 3, 1989, Ser. No. 416,532
Int. Cl.[5] H01L *41/08*
U.S. Cl. 310—323 **34 Claims**

1. A micromotor device for moving a micro-miniature element along a predetermined path comprising:

a substrate;

a membrane supported by said substrate having an upper layer with a planar surface for supporting the element to be moved and a lower layer of a piezoelectric material with a lower surface, said membrane being recessed within a well formed by said substrate;

ultrasonic generator means attached to one said membrane surface; and

means for supplying electrical power to said ultrasonic generator means to produce ultrasonic energy and thereby cause a flexural wave action in said membrane.

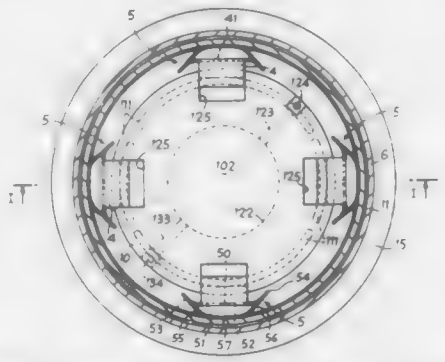
DISMOUNTABLE DEVICE FOR SUPPORTING A PIEZOELECTRIC RESONATOR INSIDE A CASING

Raymond Besson, Besancon; Richard Delaite, Belfort; Georges Renard, St Vit; Jean-Pascal Valentin, Pouilley Les Vignes, and Jean-Louis Vaterkowski, Rioz, all of France, assignors to Ecole Nationale Superieure de Mecanique et des Microtechniques, Besancon Cedex, France



Filed Oct. 18, 1989, Ser. No. 423,254
Claims priority, application France, Oct. 28, 1988, 88 14197
Int. Cl.[5] H01L *41/08*
U.S. Cl. 310—348 **23 Claims**

1. A device for supporting a piezoelectric resonator inside a casing, said device comprising:

four independent and identical U-shaped coupling flanges made of a material whose expansion coefficient in an axial direction with respect to said resonator is substantially identical to that of the material constituting said resonator, each said coupling flange cooperating with a pair of springs, each spring being formed of circular cross-section metal wire made of a high yield strength alloy, the thus constituted set of coupling flanges and springs being symmetrical with respect to two mutually perpendicular axial planes of said resonator and with respect to a center plane of said resonator,

wherein said device is further comprised of a cylindrical element that is displaceably mounted inside said casing in a region of a lateral wall thereof, said element extending throughout the height of an inner space defined by top and bottom walls of said casing and having on the inner face thereof, a circular groove located on a center plane parallel to said top and bottom walls of said casing;

wherein for each pair of springs cooperating with a common coupling flange, one of said springs engages by a first portion into a top slot formed in a planar rear face of said coupling flange at a top portion thereof, and by a second portion in said circular groove while the other of said

springs engages by a first portion into a bottom slot formed in a rear planar face of said coupling flange at a bottom portion thereof, and by a second portion inside said circular groove,

wherein said second portions of said springs engaged in said circular groove are joined together and project rearwardly with respect to said rear face of said coupling flange; and

wherein said internal faces of said coupling flanges which are substantially perpendicular to said rear face of said coupling flanges rest directly on the periphery of the top and bottom external faces of said resonator.

5,006,751

ELECTRIC LAMP AND ADAPTER SOCKET THEREFOR

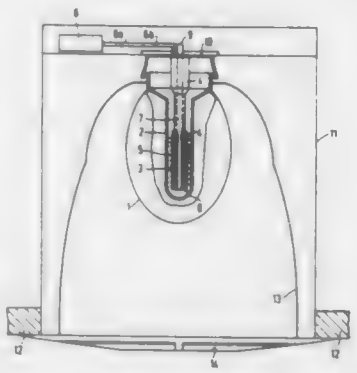
Rodney G. Marshall, 1219 Meadowridge Trail, Goshen, Ky. 40026

Filed Aug. 11, 1989, Ser. No. 392,408
Int. Cl.[5] H01J *5/54, 5/60*
U.S. Cl. 313—51 **5 Claims**

1. An electric lamp and adapter socket receivable within an internally threaded electrical socket comprising an electric light bulb formed with a conductive base, said base including a plurality of elongate registration members directed exteriorly of the base and symmetrically arranged about a central electrical contact axially aligned and extending below the registration members, and

an adapter socket receivable within the threaded electrical socket including recessed members for receiving the registration members, and

wherein the registration members include a plurality of elongate ridges symmetrically formed about the base, and



wherein the base further includes an annular recess formed medially of the base and wherein the ridges extend from the electric light bulb to the annular recess, and wherein the annular recess extends above a lowermost terminal end of the central electrical contact.

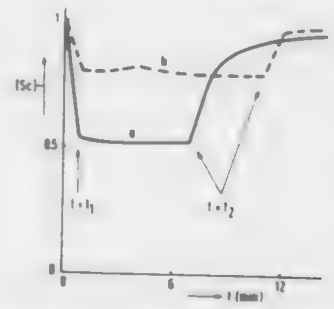
ELECTRODELESS LOW-PRESSURE DISCHARGE LAMP

Hendrik H. J. Eggink; Winand H. A. M. Friedrichs; Adriaan Netten; Herman H. M. Van Der AA, and Martin W. Schuiteman, all of Eindhoven, Netherlands, assignors to U.S. Philips Corporation, New York, N.Y.

Filed Jan. 25, 1990, Ser. No. 470,201
Claims priority, application Netherlands, Feb. 20, 1989, 89000406
Int. Cl.[5] H01J *1/50, 65/04, 61/00*
U.S. Cl. 313—161 **16 Claims**

1. An electrodeless low-pressure discharge lamp having a discharge vessel which is sealed in a gastight manner and is filled with an ionisable metal vapour and a rare gas, said lamp having a cylindrical core of a magnetic material, means comprising a metal wire winding surrounding said core for generating an electromagnetic field in said discharge vessel during the lamp operation and a high-frequency electric power supply unit connected to said wire winding said magnetic material core being provided with a cooling body, characterized in that: said cooling body is a beat pipe which is located at the area of the longitudinal axis of the core and is surrounded by the core at least as far as the proximity of its first end, while its second end is maintained at a relatively low temperature.



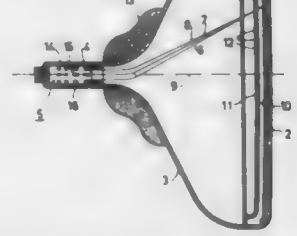
5,006,753

SCANDATE CATHODE EXHIBITING SCANDIUM SEGREGATION

Jan Hasker; Jacobus E. Crombeen; Anton K. Niessen, and Henricus J. H. Stoffelen, all of Eindhoven, Netherlands, assignors to U.S. Philips Corporation, New York, N.Y.

Filed Nov. 15, 1988, Ser. No. 271,806
Claims priority, application Netherlands, Nov. 16, 1987, 8702727
Int. Cl.[5] H01J *19/14*
U.S. Cl. 313—346 R **17 Claims**

1. A scandate cathode having a cathode body comprising a matrix of at least a high melting-point metal and/or alloy, and a barium compound in contact with the matrix material which barium compound can supply barium to the emissive surface by chemical reaction with the matrix material, characterized in that at least the top layer of the cathode body compriaes a



scandium metal compound or scandium alloy which can exhibit scandium segregation.

5,006,754

COLOR DISPLAY TUBE WITH MAGNETIC FIELD SHAPING PLATES

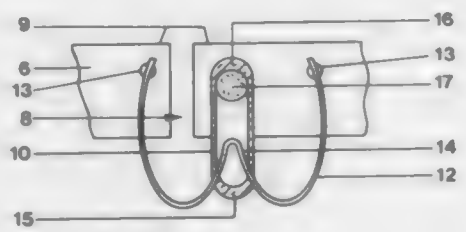
Piet G. J. Barten, Eindhoven, Netherlands, assignor to U.S. Philips Corporation, New York, N.Y.

Continuation of Ser. No. 548,276, Nov. 3, 1983, abandoned. This application Apr. 10, 1986, Ser. No. 851,282
Claims priority, application Netherlands, Nov. 18, 1982, 8204465
Int. Cl.[5] H01J *29/51, 29/76*
U.S. Cl. 313—412 **10 Claims**

1. A color display tube comprising:

(a) an evacuated envelope having a display window with an inner surface supporting a luminescent display screen;

(b) an electron gun system for producing central and first and second outer electron beams having their axes lying in a longitudinal plane intersecting the display screen, and for converging the electron beams toward a point of coincidence on said display screen;



(c) first and second deflection means disposed around the electron beam axes for producing first and second deflection fields for deflecting the electron beams in a first direction parallel to the longitudinal plane and in a second direction perpendicular to said plane, respectively; and

(d) field shaping means, arranged at an end of the electron gun system from which the electron beams exit, for locally distorting at least one of the deflection fields to augment dynamic convergence of the electron beams such that there is coincidence on the display screen of respective rasters produced by said electron beams;

characterized in that the field shaping means comprises a pair of first and second ferromagnetic plate means arranged symmetrically with respect to both the longitudinal plane and the central beam axis, each of said first and second plate means intersecting said plane outside of a respective one of the first and second outer electron beams and being shaped such that it has ends which diverge from the longitudinal plane and partially surrounds the respective outer electron beam;

said first and second plate means serving to distort the second deflection field, where the electron beams enter said field, such that said field is pin-cushion-shaped and comprises a substantially bipolar field having a six-pole component;
said distorted field effecting coincidence of said rasters without substantially defocusing the electron beams.

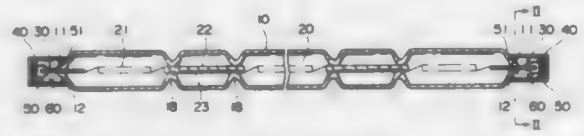
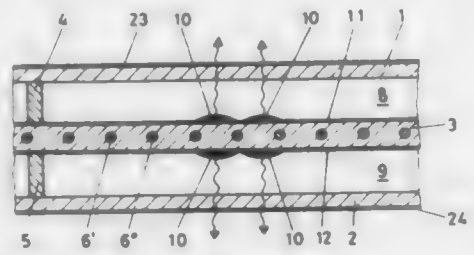
MERCURY DISCHARGE LAMP WITH MERCURY CONTAINING CAPSULE
Horst Wittmann, Stadtbergen; Michael Dietrich, Friedberg, and Erolf Weinhardt, Diedorf, all of Fed. Rep. of Germany, assignors to Patent Treuhand Gesellschaft fur elektrische Gluhlampen m.b.H., Munich, Fed. Rep. of Germany
Filed Feb. 6, 1990, Ser. No. 475,459
Claims priority, application Fed. Rep. of Germany, Mar. 7, 1989, 3907277
Int. Cl.[5] H01J 61/28, 17/22
U.S. Cl. 313—546 20 Claims

1. A discharge lamp having:
a vessel (45);
a fill which includes mercury within said vessel;
electrodes (5, 36) within the vessel;
a closed capsule (10, 18, 26, 41) within the vessel, the mercury being initially retained within said closed capsule;
a heater wire (11, 31, 35) thermally coupled to the capsule which, upon application of inductive heating thereof, opens the capsule; and
electrically conductive means (6, 29, 40) secured within the vessel and electrically and mechanically coupled to the heater wire,
wherein
the capsule is a glass capsule and comprises an elongated tubular structure (10, 18, 26, 41) closed at both ends;
the heater wire is bent upon itself into essentially V or U-shape, defining two leg portions (14, 21, 25, 42) and
said leg portions are melted into one end (15, 20, 28, 43) of the elongated glass capsule and are electrically connected (22, 23, 44) internally of the glass capsule.



5,006,756
ALKALI METAL VAPOR DISPENSER
Cornelis van der Marel, Eindhoven, Netherlands, assignor to U.S. Philips Corporation, New York, N.Y.
Filed Aug. 31, 1989, Ser. No. 401,888
Claims priority, application Netherlands, Sep. 2, 1988, 8802172
Int. Cl.[5] H01J 17/26
U.S. Cl. 313—564 8 Claims

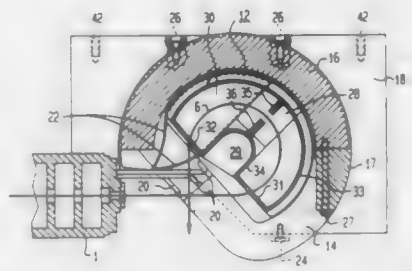
1. A device for releasing metal vapour of an alkali metal comprising a holder containing a powder of pulverulent particles from which the alkali metal is released upon heating, characterized in that the powder comprises grains of silicon or



germanium with a shell of a compound of silicon or germanium and the alkali metal.

5,006,757
INCANDESCENT LAMP
Toru Odagaki, Okayama, Japan, assignor to Ushio Denki Kabushiki Kaisha, Tokyo, Japan
Filed Dec. 11, 1989, Ser. No. 448,327
Int. Cl.[5] H01J 17/18, 5/50; H01K 1/42
U.S. Cl. 313—623 6 Claims

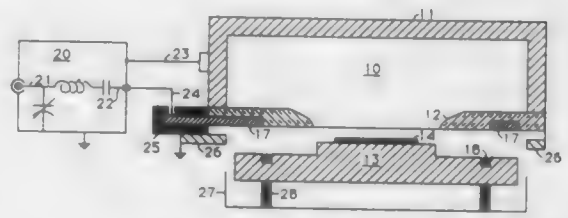
1. In an incandescent lamp comprising a glass envelope, a filament supported by constricted portions of the glass envelope, lead rods extending from both ends of the filament, tapered constricted portions at both ends of the glass tube to provide sealing portions by which the lead rods are surrounded respectively, and contacts connected to the outer ends of the lead rods respectively, the improvement wherein the sealing portions are formed in such a manner that their outer diameters are equal to or smaller than those of the respective contact, cylindrical bases are arranged so as to enclose the respective contacts, portions of the lead rods which project out of the sealing portions, and the sealing portions, and to be in contact at the inner ends thereof with the respective tapered constricted portions following the sealing portions, and a fixing cement is filled in the bases.



5,006,758
HIGH-POWER RADIATOR
Bernd Gellert, Wettingen, and Ulrich Kogelschatz, Hausen, both of Switzerland, assignors to Asea Brown Boveri Ltd., Baden, Switzerland
Filed Oct. 5, 1989, Ser. No. 417,473
Claims priority, application Switzerland, Oct. 10, 1988, 3778/88
Int. Cl.[5] H01J 61/06
U.S. Cl. 313—634 12 Claims

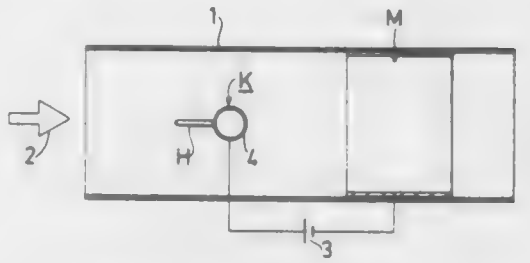
1. A high-power radiator, in particular for ultraviolet light, having a discharge space, delimited by walls and filled with filler gas emitting radiation under discharge conditions, having

electrode pairs which are connected in pairs to the two poles of a high-voltage source, at least one dielectric material which adjoins the discharge space lying between two electrodes at different potentials, wherein the aforesaid electrode pairs, spatially separated from said walls and separated from each other by dielectric material, are arranged adjacent to one another in such a way that the electrical discharge in the discharge space forms essentially only in the region of the surface of the dielectric.



5,006,759
TWO PIECE APPARATUS FOR ACCELERATING AND TRANSPORTING A CHARGED PARTICLE BEAM
Franz Krispel, Walnut Creek, Calif., assignor to Siemens Medical Laboratories, Inc., Walnut Creek, Calif.
Filed May 9, 1988, Ser. No. 191,633
Int. Cl.[5] H05H 7/08, 7/10
U.S. Cl. 315—5.41 12 Claims

10. Apparatus for accelerating and transporting a charged particle beam, comprising:
(a) an accelerating structure having a first envelope which encloses a first evacuated space, said accelerating structure accelerating the charged particle beam within the first evacuated space and emitting the accelerated charged particle beam from said first evacuated space along a first beam axis;
(b) a magnet system having a second envelope which encloses a second evacuated space, said second envelope receiving the charged particle beam emitted along said first beam axis by said accelerating structure, and said magnet system transporting the charged particle beam within the second evacuated space along a bent beam path and emitting the charged particle beam from said second evacuated space along a second beam axis having a spatial orientation which is different from the first beam axis; and
(c) supporting means for supporting the accelerating structure and the magnet system such that the position of the second envelope with respect to the first beam axis is physically movable so as to adjust the spatial orientation of said first beam axis with respect to said second beam axis, and
wherein the second evacuated space contains a gas whose effective cross section for the charged particles is lower than that of air.

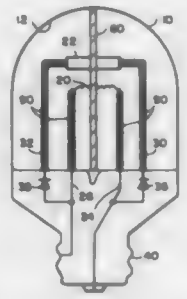


5,006,760
CAPACITIVE FEED FOR PLASMA REACTOR
Herbert G. Drake, Jr., San Rafael, Calif., assignor to Motorola, Inc., Schaumburg, Ill.
Filed Jan. 9, 1987, Ser. No. 1,773
Int. Cl.[5] H05B 31/26
U.S. Cl. 315—111.21 5 Claims

1. In a plasma reactor having an enclosed volume in which a plasma is generated between a grounded electrode and a moveable, powered electrode separated by an insulator, the improvement comprising means for capacitively coupling RF power to said enclosed volume wherein said means comprises a conductive ring for overlapping a portion of said moveable electrode and a second insulator for separating said conductive

ring from said moveable electrode to form a capacitor with said moveable electrode.

5,006,761
AIR TRANSPORTING ARRANGEMENT
Vilmos Török, Lidingö , and Andrzej Loreth, Åkersberga, both of Sweden, assignors to Astra-Vent AB, Stockholm, Sweden
PCT No. PCT/SE86/00548, § 371 Date May 27, 1988, § 102(e) Date May 27, 1988, PCT Pub. No. WO87/04020, PCT Pub. Date Jul. 2, 1987
PCT Filed Dec. 2, 1986, Ser. No. 199,258
Claims priority, application Sweden, Dec. 20, 1985, 8506067
Int. Cl.[5] H01J 7/24; H01T 23/00
U.S. Cl. 315—111.91 9 Claims



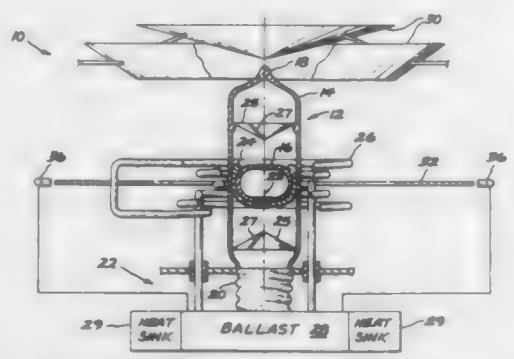
1. An arrangement for generating a flow of air along an airflow path therefor with the aid of an electric ion-wind, comprising a corona electrode in said airflow path, at least one target electrode located in said airflow path downstream of and spaced from said corona electrode as seen in the axial extension of the airflow path and being permeable to a flow of air along said path, and a d.c. voltage source having a first terminal connected to said corona electrode and a second terminal connected to said target electrode for creating an air ion producing corona discharge at said corona electrode, said corona electrode including at least one wire-like electrode element located close to the symmetry axis of said airflow path and having such dimensions and such orientation that its extension in directions perpendicular to said symmetry axis is substantially much smaller that the total cross-sectional dimensions of said airflow path, and lacking ends at which the electrical field strength exceeds the electrical field strength at the peripheral surface of the electrode element, so as to avoid punctiform corona-discharge concentrations and to confine the corona discharge to the peripheral surface of the electrode element.

5,006,762

NEGATIVE GLOW FLUORESCENT LAMP HAVING DISCHARGE BARRIER

John W. Shaffer, Danvers, Mass., assignor to GTE Products Corporation, Danvers, Mass.

Filed Apr. 9, 1990, Ser. No. 506,149
Int. Cl.[5] H01J *61/10*; H05B *37/00*
U.S. Cl. 315—205 25 Claims



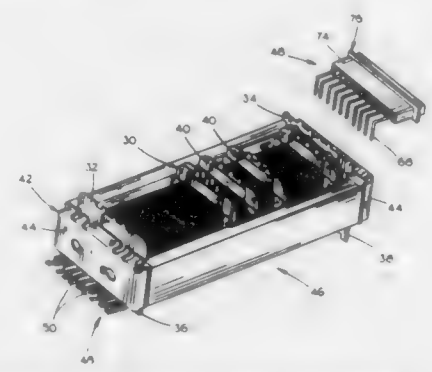
1. A negative glow fluorescent lamp comprising:
a light-transmissive envelope enclosing a fill material which emits ultraviolet radiation upon excitation;
a phosphor coating on an inner surface of said envelope, said phosphor coating emitting visible light upon absorption of ultraviolet radiation;
a cathode located in said envelope for emitting electrons;
anode means located in said envelope and spaced from said cathode for collecting said electrons;
means for coupling electrical energy through said envelope to said cathode and said anode means; and
one or more electrically insulating discharge barriers disposed adjacent to said cathode for suppressing electron bombardment of said cathode when one end thereof is positively biased relative to the other end.

5,006,763

LUMINAIRE FOR AN ELECTRODELESS HIGH INTENSITY DISCHARGE LAMP WITH ELECTROMAGNETIC INTERFERENCE SHIELDING

John M. Anderson, Scotia, N.Y., assignor to General Electric Company, Schenectady, N.Y.

Filed Mar. 12, 1990, Ser. No. 491,920
Int. Cl.[5] H05B *41/24*
U.S. Cl. 315—248 23 Claims



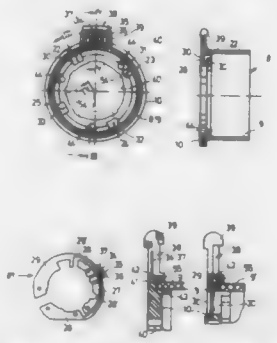
1. A luminaire, comprising:
an electrodeless high intensity discharge lamp including an elongated, light-transmissive envelope and a light-transmissive arc tube disposed within said envelope for containing a fill;
an excitation coil coupled to a radio frequency power supply and disposed about said envelope for establishing a first radio frequency magnetic field extending through said arc tube and radiating outwardly therefrom, said first radio frequency magnetic field exciting an arc discharge in said fill so as to produce visible light output which passes through said arc tube and said light-transmissive envelope;
a base assembly for mounting said lamp thereon; and
passive electromagnetic shielding means comprising at least one conductive surface situated proximate said envelope and oriented such that said first radio frequency magnetic field induces current on said surface that establishes a second radio frequency magnetic field tending to cancel, at a distance from said lamp, said first radio frequency magnetic field, said passive electromagnetic shielding means interfering minimally with said visible light output.

5,006,764

FLUORESCENT LAMP BALLAST WITH END CONNECTOR

Dail L. Swanson, and Larry J. Costa, both of Danville, Ill., assignors to Valmont Industries, Inc., Valley, Nebr.

Filed Jul. 17, 1989, Ser. No. 381,035
Int. Cl.[5] H05K *5/04*
U.S. Cl. 315—276 7 Claims



1. A ballast for a fluorescent lamp, comprising:
a base;
a cord means mounted on said base;
a plurality of coils operatively electrically associated with said core means, each of said coils having at least one conductor extending therefrom;
a cover means positioned over said core means and said coils, and secured to said base to form a totally enclosed housing;
an electrical connector means mounted in a front wall of said cover means with a forward end projecting therefrom and having a plurality of socket means in said forward end for removably receiving and electrically connecting a wiring harness to conductors from said coils;
said connector means having forward and rearward ends and left and right sides, the sockets of said connector means being formed generally horizontally from left to right at the lower end of the front wall of said cover means, for easy connection to a fixture-mounted wiring harness;
a plurality of terminal pins having a forward end extending within said sockets in said electrical connector means for electrical connection to a wiring harness, and a rearward end projecting rearwardly from said connector means into said ballast housing, the rearward end of said terminal pins being electrically connected to predetermined conductors extending from said coils.

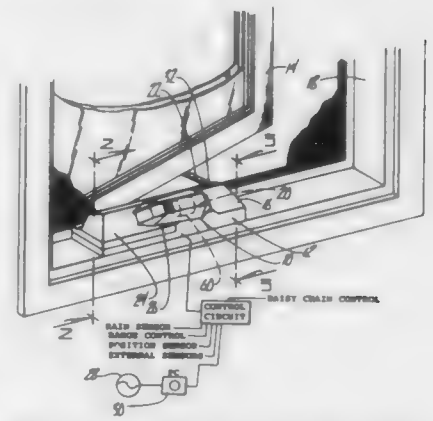
5,006,765

DC MOTOR WITH CORELESS COIL INSTALLATION

Fritz Schmider, Horuberg, Fed. Rep. of Germany, assignor to Papst-Motoren GmbH & Co. KG, St. Georgen, Fed. Rep. of Germany

Continuation of Ser. No. 161,303, Feb. 25, 1988, abandoned, which is a continuation of Ser. No. 22,395, Mar. 6, 1987, abandoned. This application Feb. 28, 1989, Ser. No. 317,034
Claims priority, application Fed. Rep. of Germany, Mar. 6, 1986, 3607289
Int. Cl.[5] H02K *21/22, 29/06*
U.S. Cl. 310—71 14 Claims

1. A dc motor having a stator and a rotor, the two separated from one another by a cylindrical air gap, comprising:
a coreless coil wound in a self-supporting manner from baked enamel wire into a thin-walled, cylindrical body form;
a plurality of electrical connectors provided on the coil, including the coil ends and intermediate taps in the form of wire loops, all extending from the coil body;
a ring flange having insulation on at least one of its faces receiving the mounting of the coreless coil;
a thin, flat metal electrical connecting plate included in the ring flange;
a plurality of conductor paths electrically isolated from each other formed in the connecting plate, at least one conductor path being provided for each electrical connector on the coil, and the insulation separating the coil body from the isolated conductor paths when the coil is so mounted;
an aperture provided in the insulation for each conductor path through which the conductor path is accessible for direct connection thereto of a respective connector of the coil body; and
an electrical contact surface extending radially from each of the conductor paths for further electrical connections from the outside of the motor.



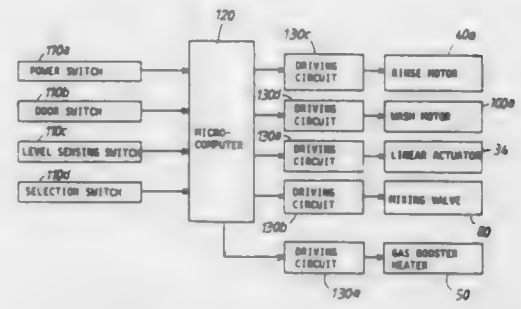
5,006,766

WINDOW OPERATOR FOR MANUALLY OR ELECTRICALLY MOTORIZED ACTUATION OF A MECHANICAL WINDOW DRIVE SYSTEM

Ralph G. Yuhas, and William H. Birmingham, both of Helena, Mont., assignors to Rolscreen Company, Pella, Iowa

Filed Aug. 14, 1989, Ser. No. 393,130
Int. Cl.[5] E05F *15/00*
U.S. Cl. 318—53 19 Claims

1. A motorized window operator for opening and closing a window having a mechanical drive system including a rotatable drive axle comprising:
a housing means which is both translatable and rotatable with respect to an engagement means;
motor means having an output shaft rotatable in opposite directions contained within the housing means;
the engagement means engaging the rotatable drive axle of the window;
gear means for transferring rotational movement of the output shaft of the motor means through the engagement means to the drive axle of the window;
translation means for moving the gear means between a first position in operative engagement with the engagement means, and a second position out of operative engagement with the engagement means; and



mating means mateable and engageable with the engagement means when the gear means is in the second position and allowing manual rotation of the drive axle by manual rotation of the housing means.

5,006,767

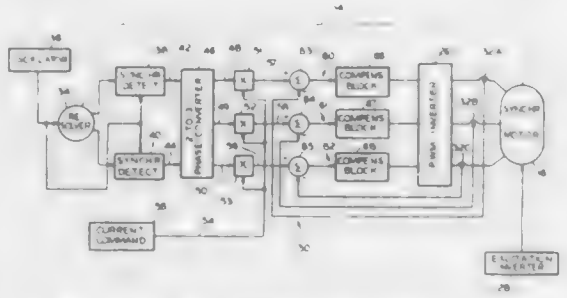
ELECTRIC CONTROL APPARATUS FOR DISHWASHING MACHINE

Fumio Maruyama, Nagoya; Tomio Suyama; Hiroaki Kamino, both of Toyoake; Koji Suyama, Shimane; Tokihiro Kuwahara, Kariya, and Osamu Nagata, Toyoake, all of Japan, assignors to Hoshizaki Denki Kabushiki Kaisha, Toyoake, Japan

Filed Mar. 2, 1990, Ser. No. 487,327
Claims priority, application Japan, Mar. 3, 1989, 1-52475; Aug. 28, 1989, 1-221120
Int. Cl.[5] B08B *3/02*
U.S. Cl. 318—103 12 Claims

1. An electric control apparatus for a dishwashing machine having a washing chamber, a first electric power operated pumping means for pumping out wash water from a wash water storage tank in said washing chamber, a second electric power operated pumping means for pumping out heated water from a heated water storage tank, and first and second revolving arms arranged within said washing chamber to be supplied with the wash and heated water from said first and second electric power operated pumping means for directing jet streams of the wash and heated water to a rack of tableware placed in said washing chamber respectively, comprising;
mixing means for mixing cold water from a source of cold water into the heated water to form mixing water;
first means for controlling said second electric power operated pumping means such that said second revolving arm directs jet stream of the mixing water from said mixing means to said rack of tableware;
second means responsive to finish in control of said first means for controlling said first electric power operated

pumping means such that said first revolving arm directs jet stream of the wash water to said rack of tableware; and



third means responsive to finish in control of said second means for controlling said second electric power operated pumping means such that said second revolving arm directs jet stream of the heated water to said rack of tableware.

5,006,768

SYNCHRONOUS MOTOR CONTROL

Gregory I. Rozman, Rockford, Ill., assignor to Sundstrand Corporation, Rockford, Ill.

Filed Oct. 19, 1989, Ser. No. 423,940
Int. Cl.[5] H02P *1/46*
U.S. Cl. 318—254 **5 Claims**

1. A start control for a brushless motor having a rotor and a stator having a three-phase stator coil comprising:

a resolver circuit including means for generating two phase displaced sinusoidal signals each representing angular position of the rotor;

a converter circuit coupled to said resolver circuit for converting said two phase displaced sinusoidal signals to three phase displaced sinusoidal signals;

means for developing a current command signal having a level representing a desired stator current level;

means coupled to said converter circuit and said developing means for combining each of said three phase displaced sinusoidal signals with said current command signal to provide three phase displaced sinusoidal current reference signals;

sensing means for sensing current through each phase of said stator coil;

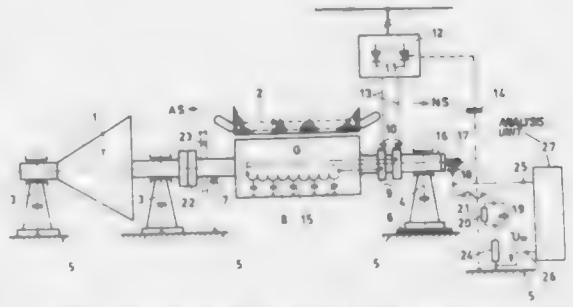
a current control coupled to said sensing means and said combining means including means for developing a compensated error signal for each phase; and

an inverter circuit operatively driven by said compensated error signals and coupling a source of power to said stator coil to provide closed loop control of motor starting current.

5,006,769

ARRANGEMENT FOR DETECTING WINDING SHORTS IN THE ROTOR WINDING OF ELECTRICAL MACHINES

Zlatimir Posedel, Neuenhof, Switzerland, assignor to Asea Brown Boveri Ltd., Baden, Switzerland



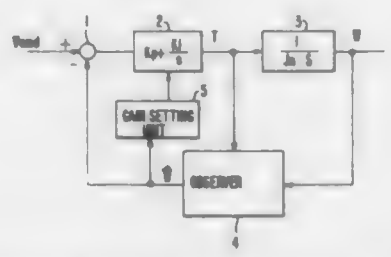
Filed Mar. 23, 1990, Ser. No. 497,720
Claims priority, application Switzerland, Apr. 5, 1989, 1264/89
Int. Cl.[5] H02H *7/08*
U.S. Cl. 318—434 **4 Claims**

1. Arrangement for detecting winding shorts in a rotor winding of an electrical machine having a drive shaft, comprising:

said drive shaft having a drive end which is directly grounded and a non-drive end;

a voltage measuring element provided at the non-drive end for recording a shaft voltage between the machine shaft and ground; and

an analysis unit coupled to said voltage measuring element and receiving said shaft voltage for evaluating at least one of even and fractional harmonics produced in the shaft



voltage and producing an output signal when the content of said at least one of said even and fractional harmonics exceed a predetermined value.

5,006,770

SERVOMOTOR VELOCITY CONTROL APPARATUS

Keiji Sakamoto, Hachioji, and Hironobu Kuwano, Oshino, both of Japan, assignors to Fanuc Ltd, Minamitsuru, Japan

PCT No. PCT/JP88/00402, § 371 Date Dec. 9, 1988, § 102(e) Date Dec. 9, 1988, PCT Pub. No. WO88/08640, PCT Pub. Date Nov. 3, 1988
PCT Filed Apr. 25, 1988, Ser. No. 290,290
Claims priority, application Japan, Apr. 30, 1987, 62-107252
Int. Cl.[5] G05B *13/00*
U.S. Cl. 318—561 **5 Claims**

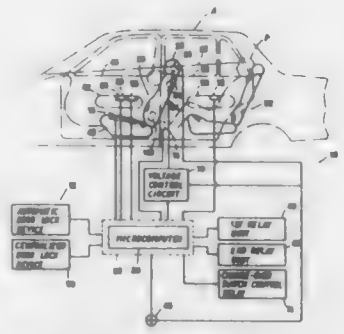
1. A servomotor velocity control apparatus for controlling the velocity of a servomotor by a discrete velocity command signal, the apparatus having a limitation on a fixed resolution with regard to discrete detection of actual velocity, comprising:

arithmetic means for computing an error between an estimated velocity of the servomotor and a commanded velocity corresponding to the discrete velocity command signal;

compensating means, which has a control gain that includes a proportional gain and a variable integration gain, for forming a torque command for the servomotor based on the error output from said arithmetic means; and

control means for setting and controlling the integration gain of said compensating means so that the integration gain becomes inversely proportional to the estimated velocity of the servomotor which is based on the discretely detected actual velocity and the torque command.

5,006,771



METHOD AND DEVICE FOR CONTROLLING HEADREST

Hiromitsu Ogasawara, Akishima, Japan, assignor to Tachi-S Co., Ltd., Tokyo, Japan

Filed Apr. 10, 1990, Ser. No. 507,156
Int. Cl.[5] G05B *19/28*
U.S. Cl. 318—568.1 **6 Claims**

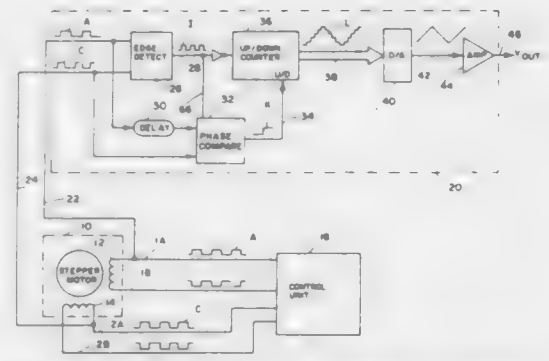
1. A method for controlling a headrest in automobile in

which said headrest is movably mounted on a seat such as to be movable between a use position for supporting a head of an occupant on said seat and a non-use position below a sight line of another occupant on another seat in said automobile to attain a good view field, in which said headrest is automatically controlled its movement between said use and non-use positions, responsive to a speed of said automobile, opened/-closed state of a door of said automobile and operating state of mechanical or workable parts in said automobile, thereby establishing an automatic control of said headrest, said method comprising the steps of:

permitting a manual control for causing said headrest to move between said use and non-use position by operation of an automatic operation switch;

permitting a manual adjusting control of said headrest at least in one of its fore-and-aft adjustment and vertical adjustment, by operation of a manual adjustment switch;

responding to said operation of said automatic operation switch and manual adjustment switch; and,



then, changing said automatic control to said manual controls of said headrest.

5,006,772

POSITION MONITOR FOR A STEPPER MOTOR

Clive M. Danby, Rockford, Ill., assignor to Sundstrand Corporation, Rockford, Ill.

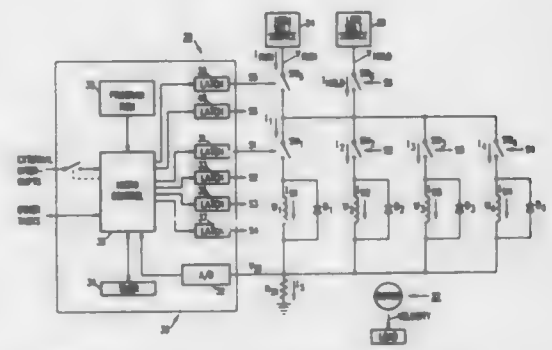
Filed Nov. 21, 1989, Ser. No. 439,720
Int. Cl.[5] H02P *8/00*
U.S. Cl. 318—696 **37 Claims**

1. A position monitor for a stepper motor, comprising:

first means connected in signal communication with said stepper motor for providing a first signal and a second signal, said first signal comprising a plurality of pulses, each of said plurality of pulses representing a change of the voltage magnitude of a phase winding of said stepper motor, said second signal representing the direction of rotation of a rotor of said stepper motor;

second means, connected in signal communication with said first providing means, for providing a third signal, the magnitude of said third signal being representative of the rotational position of said rotor of said stepper motor, the magnitude of said third signal being a cumulative function of said first and second signals;

said second providing means comprises means for storing a digital value representing an accumulation of said plurality of pulses and means for selectively increasing and decreasing said digital value upon each occurrence of one of said plurality of pulses as a function of said second signal; and



said second providing means comprises means for converting said digital value to a voltage magnitude.

5,006,773

MICROCOMPUTER CONTROL OF STEPPER MOTOR USING REDUCED NUMBER OF PARTS

Edward Goldberg, Wayland, Mass., assignor to NEC Electronics Inc., Mountain View, Calif.

Continuation of Ser. No. 377,518, Jul. 10, 1989, abandoned, Division of Ser. No. 173,960, Mar. 28, 1988, Pat. No. 4,847,544. This application Aug. 10, 1990, Ser. No. 566,804
Int. Cl.[5] H02P *8/00*
U.S. Cl. 318—696 **14 Claims**

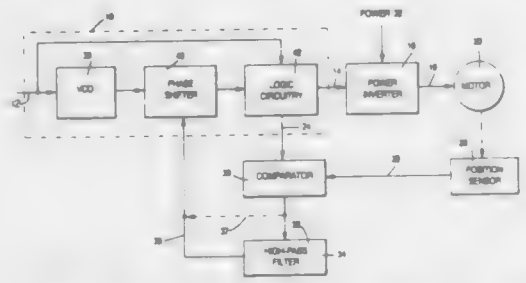
1. With respect to an apparatus for controlling a motor having two or more substantially identical windings, a method for fabrication and operating the apparatus, the method comprising the steps of:

coupling an operative current sensing element in series with a first of the motor windings for operatively sensing current flow through the first winding;

coupling a dummy sensing element in series with a second of the motor windings, the dummy sensing element being substantially identical to the operative sensing element so that respective current carrying circuits of the first and second motor windings are substantially identical;

inserting first and second switches respectively in the current carrying circuits of the first and second windings for controlling current flow through the first and second windings;

providing control means, operatively coupled to receive a feedback signal from the operative sensing element and to transmit switch opening and closing control signals to the first and second switches; and



opening and closing both the first and second switches in response to the feedback signal in substantially identical manner such that substantially identical, although perhaps time-staggered, current waveforms will develop in the first and second windings.

5,006,774

TORQUE ANGLE CONTROL SYSTEM FOR CONTROLLING THE TORQUE ANGLE OF A PERMANENT MAGNET SYNCHRONOUS MOTOR

Fenton Rees, Ann Arbor, Mich., assignor to Sundstrand Corporation, Rockford, Ill.

Filed Mar. 13, 1990, Ser. No. 492,120
Int. Cl.[5] H02P *7/42*
U.S. Cl. 318—721 8 Claims

1. A torque angle control system for maintaining a predetermined torque angle in a synchronous motor, comprising:

speed command converting means for receiving a speed command signal, correcting said speed command signal, converting said speed command signal to a synchronous motor control signal, outputting said synchronous motor control signal to control a synchronous motor, and outputting a fundamental signal related to said synchronous motor control signal;

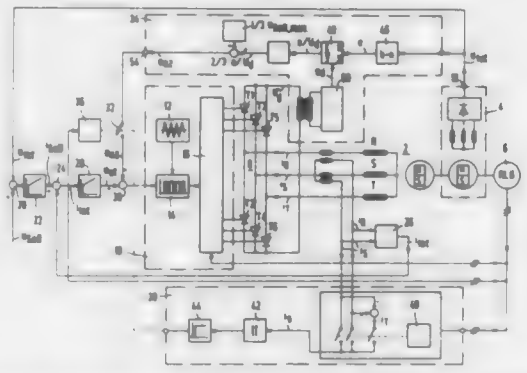
position sensor means for sensing rotational position of a rotor of said synchronous motor and outputting a rotor position signal; and

comparing means for comparing said fundamental signal to said rotor position signal and outputting a correction signal for correcting said speed command signal thereby maintaining a predetermined torque angle in said synchronous motor by maintaining a predetermined relationship between said synchronous motor control signal and said rotor position signal;

wherein said speed command converting means includes

a voltage controlled oscillator for converting the speed command signal into a frequency signal, and

a phase shifter for receiving said frequency signal from said voltage controlled oscillator, receiving said correction signal from said comparing means, phase shifting said frequency signal in response to said correction signal and outputting a phase shifted frequency signal.



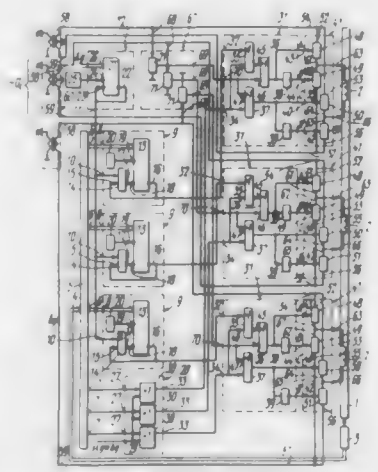
5,006,775

METHOD AND APPARATUS FOR PREVENTING A CURRENT COLLAPSE IN A PHASE NOT PARTICIPATING IN THE COMMUTATION OF A THREE-PHASE, BLOCK-CURRENT SUPPLIED SYNCHRONOUS MACHINE

Jens Hamann, Fuerth-Stadeln, and Hartmut Vogt, Herzogenaurach, both of Fed. Rep. of Germany, assignors to Siemens Aktiengesellschaft, Berlin & Munich, Fed. Rep. of Germany

Filed Oct. 17, 1988, Ser. No. 258,826
Claims priority, application Fed. Rep. of Germany, Oct. 26, 1987, 3736213
Int. Cl.[5] H02P *5/40;* H02K *19/10*
U.S. Cl. 318—723 4 Claims

1. A circuit arrangement for preventing a current collapse in a phase not participating in a commutation of a three-phase block current supplied synchronous machine while phase currents of two other phases are being commutated, comprising means for applying, during the commutation of said two phase currents, an additional control voltage to a control voltage controlling the speed of the synchronous machine such that the average current drop in a down-commutating phase is equal to the average negative current rise in an up-commutating phase, said block current supplied synchronous machine being equipped with a converter, a tachometer generator, a rotor position encoder and a controller, an output of the controller being tied to an input of a control unit of the converter and a summing element being arranged between the output of the controller and the input of the control unit, the summing



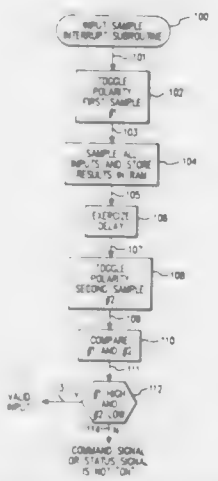
element having a second input which is linked via a switch to a device for generating an additional control voltage, the switch being switched on via a commutation pickup which is tied to an output of the rotor position encoder and being switched off via a device for determining the end of the commutation.

5,006,776

GATE-CONTROLLED ELECTRIC DRIVE

Ljudmila I. Matjukhina; Alexandr S. Mikhalev; Sergei N. Sidoruk, and Igor M. Chusbenkov, all of Minsk, U.S.S.R., assignors to Belorussky Gosudarstvenny Universitet Imeni V.I. Lenina, Minsk, U.S.S.R.

PCT No. PCT/SU87/00057, § 371 Date Jan. 17, 1989, § 102(e) Date Jan. 17, 1989, PCT Pub. No. WO88/09082, PCT Pub. Date Nov. 17, 1988
PCT Filed May 14, 1987, Ser. No. 360,938
Int. Cl.[5] H02P *5/34*
U.S. Cl. 318—723 7 Claims



1. A gate-controlled electric drive comprising a synchronous motor having a plurality of windings; a shaft position transducer connected to said synchronous motor and having an output; a permanent memory storing width and polarity codes of power supply pulses of the windings of said synchronous motor and having an address input connected to said output of said shaft position transducer and having a plurality of outputs for setting width codes and a plurality of outputs for setting polarity codes; a plurality of pulse-width modulators, each pulse-width modulator having an input connected to a respective output for setting width codes of said memory and having a complementing input and an output; a controlled frequency divider having a control input receiving a control signal modulus code, a complementing input and an output connected to said complementing input of said pulse-width modulators; a first pulse generator having an output connected to said complementing input of said controlled frequency divider; a reverser having a control input receiving a control signal polarity code, inputs connected to respective outputs for setting polarity codes of said memory and outputs; a plurality of control units, each control unit having a control input connected to said output of a corresponding pulse-width modulator, a polarity setting input connecting to a corresponding output of the reverser, a polarity correction input and a plurality of outputs; a plurality of switching units, each switching unit having a power input, an input connected to a respective output of a respective control unit, and an output connected to a respective winding of said synchronous motor, and each switching unit including bi-directional switches connected in a bridge circuit; an m-phase transformer connected to a.c. m-phase means, output windings of said transformer being connected to said power inputs of respective switching units; and a timer connected to said m-phase transformer and to said polarity correction inputs of said control units.

5,006,777

AC INPUT SYSTEM FOR COMPUTER-BASED CONTROL SYSTEM

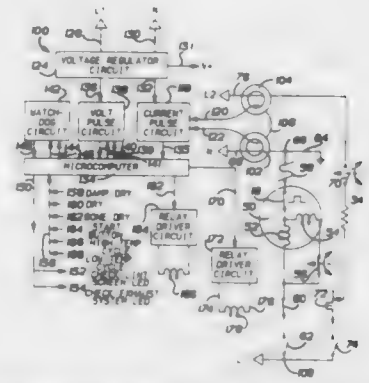
James L. Lagree, Plum Borough, Pa., assignor to Westinghouse Electric Corp., Pittsburgh, Pa.

Filed Apr. 27, 1987, Ser. No. 43,573
Int. Cl.[5] H02P *3/18*
U.S. Cl. 318—798 5 Claims

1. In a computer system operative to provide control signals in response to a plurality of input signals selectively interrogated, each interrogated input signal normally representing an AC power voltage of fundamental frequency in the form of a first train of pulses of equal width having successive high and low digital levels at the frequency and phase of said AC power voltage; the combination of:

means responsive to said AC power voltage for generating a reference signal in the form of a reference train of pulses having high and low digital levels of the same width as normally for said first train, at the same said frequency, and shifted therefrom by a predetermined delay;

means responsive to said first train of pulses for sampling the digital level thereof; first upon the occurrence of one of a falling and rising edge in said reference train, secondly a half-cycle thereafter; thereby to derive consecutive first and a second samples thereupon; and



means for comparing said first and second samples for detecting in relation to a predetermined lack of parity between consecutive first and second samples an indication of invalidity of said interrogated input signal.

5,006,778

MOTOR DIAGNOSTICS AND ELECTRONIC CONTROL FOR A CLOTHERS DRYER

Larry T. Beshark, St. Joseph Township, Berrien County, Mich., assignor to Whirlpool Corporation, Benton Harbor, Mich.

Continuation-in-part of Ser. No. 392,368, Aug. 11, 1989, and a continuation-in-part of Ser. No. 392,473, Aug. 11, 1989, and a continuation-in-part of Ser. No. 397,755, Aug. 23, 1989, and a continuation-in-part of Ser. No. 460,269, Jan. 2, 1990. This application Jan. 2, 1990, Ser. No. 460,260
Int. Cl.[5] H02P *7/36*
U.S. Cl. 318—799 20 Claims

1. A method of detecting non-cyclical changes in the velocity of a rotating member, said method consisting of the steps of:

periodically providing a velocity representation of an average velocity of said rotating member;

periodically providing a sign representation of the sign of the arithmetic difference between two consecutive velocity representations;

periodically determining the non-cyclical change in the velocity of said rotating member by observing the sign of a first predetermined number of consecutive sign representations; and

detecting a preselected non-cyclical change in the velocity of said rotating member when a second predetermined number of sign representations having the same preselected sign are present among said first predetermined number of sign representations.

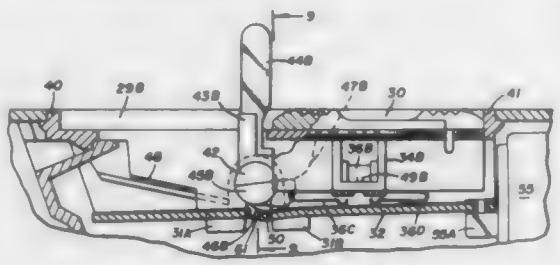
ELECTRICAL UNIT WITH MULTI-POSITION SWITCH

Kenneth R. Feane, Glen Ellyn; Wayne D. Steward, Aurora, and Witalij Didyk, Addison, all of Ill., assignors to Pittway Corporation, Northbrook, Ill.

Continuation of Ser. No. 20,700, Mar. 2, 1987, Pat. No. 4,743,829, which is a continuation of Ser. No. 748,304, Jun. 24, 1985, Pat. No. 4,647,832, which is a continuation-in-part of Ser. No. 634,774, Jul. 26, 1984, abandoned. This application Feb. 16, 1988, Ser. No. 156,243
Int. Cl.[5] H02J *7/00;* H01M *10/46*
U.S. Cl. 320—2 17 Claims

1. An electrically powered device removably couplable to an associated power source comprising:



a housing;

first and second rigid conducting members for electrically coupling to the associated power source;

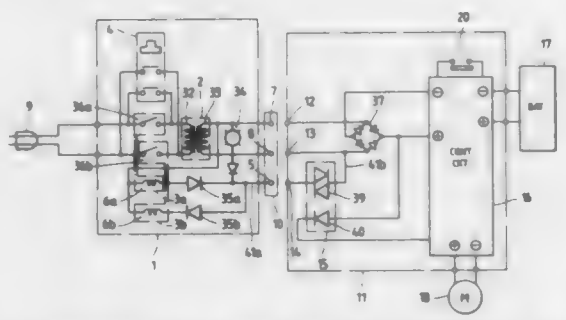
means mounting said members on said housing for only a first type of movement between a coupling position and a non-coupling position;

means, carried by said housing, displaceable with only a second type of movement, different from said first type,

between at least first and second positions, said conducting members are couplable to the associated power source only when said displaceable means is in said first position, said conducting members are in said non-coupling position when said displaceable means is in said second position and substantially overlying said prongs;

a source of illumination;

a rechargeable battery and a recharging circuit for said battery; and



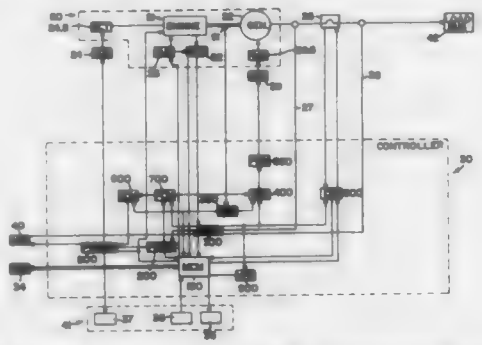
means for electrically connecting said conducting members to said recharging circuit at least when said members are in said coupling position.

5,006,780

CHARGING CIRCUIT

Kozo Tamura; Toshiharu Kodato; Syoichi Nihira; Yasuhiro Tsukamoto, and Akira Iida, all of Hitachi, Japan, assignors to Hitachi, Ltd., Tokyo and Tagasangyo, Ltd., Hitachi, both of, Japan

Filed Apr. 13, 1989, Ser. No. 336,785
Claims priority, application Japan, Apr. 13, 1988, 63-89084
Int. Cl.[5] H02J 7/04
U.S. Cl. 320—54 3 Claims



1. A charging circuit comprising a main circuit for charging a battery, and a power unit connected to an electric power source and said main circuit through a connector and including relay means with relay contact means for supplying and for interrupting current to said main circuit from said electric power source through said connector when said relay means is energized to close said relay contact means by a control means, wherein said main circuit and said power unit have signal wires, respectively, for transmitting a control signal through said connector to said relay means for opening said relay contact means when said main circuit completes charging of said battery, said power unit including an element connected between said battery and a terminal therein connected to said connector for detecting a reverse current from said battery to said terminal and for transmitting said control signal to said relay means through said connector for preventing a flow of reverse current from said battery to said terminal, said power unit further including a parallel circuit comprising a first series circuit of a first diode and a first direct current relay and a second series circuit of a second diode and a second direct current relay connected in antiparallel to said first diode and said first direct current relay, said parallel circuit being connected between said electric power source and said connector, and said relay contact means of said relay means being provided by each contact of said first and second direct current relays.

5,006,781

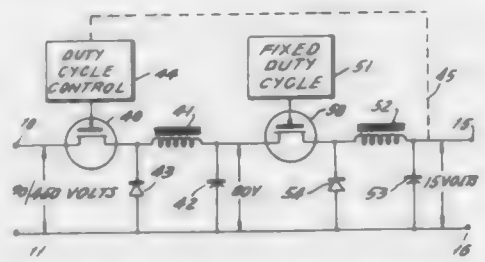
MICROPROCESSOR BASED INTEGRATED GENERATOR SET CONTROLLER APPARATUS AND METHOD

Mark H. Schultz, Shoreview, and David J. Koenig, Wyoming, both of Minn., assignors to Onan Corporation, Minneapolis, Minn.

Filed May 9, 1988, Ser. No. 191,560
Int. Cl.[5] H02H 7/06; H02P 9/00
U.S. Cl. 322—25 18 Claims

1. A control system for controlling the voltage and current output signals of a generator, comprising:

(a) first sensing means, operatively connected to the generator, for sensing the voltage and current output signals of the generator and for providing a sensed voltage signal and a sensed current signal; and



(b) first control means, operatively connected to the generator and to said first sensing means to receive said sensed voltage and current signals, for selectively controlling the voltage or current output signals of the generator in response to the magnitude of the current output signal, said first control means controlling the voltage or current signals according to a control process equation having coefficients, wherein the coefficients of said control process equation are changed according to whether the voltage or current signals are being controlled.

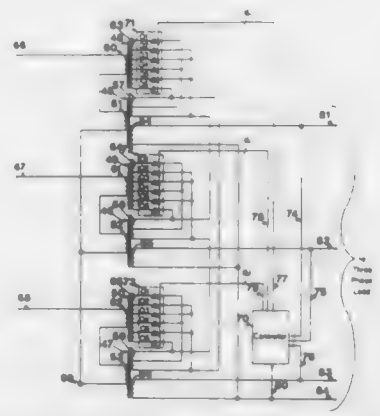
5,006,782

CASCADED BUCK CONVERTER CIRCUIT WITH REDUCED POWER LOSS

Brian R. Pelly, Palos Verdes Estates, Calif., assignor to International Rectifier Corporation, El Segundo, Calif.

Filed Jun. 15, 1989, Ser. No. 366,689
Int. Cl.[5] G05F 1/56
U.S. Cl. 323—225 17 Claims

1. A cascaded buck converter circuit comprising, in combination:



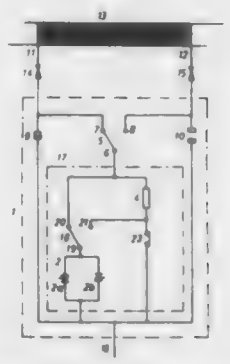
a pair of input terminals for connection to a source of input voltage; a first and a second switching transistor; a first and a second diode, a first and a second inductor and a first and a second capacitor; said pair of input terminals, said first switching transistor, said first inductor and said first capacitor connected in series circuit relation; said first diode connected in parallel with the series connection of said first inductor and said first capacitor thereby to define a first buck converter stage; said first capacitor, said second switching transistor, said second inductor and said second capacitor connected in series circuit relation; said second diode connected in parallel with the series connection of said second inductor and said second capacitor; the terminals of said second capacitor defining a pair of output terminals for connection to one of an output circuit or to a further buck converter stage; said first and second switching transistor being comprised respectively of a first and second power MOSFET each with a respective silicon area, the first and second MOSFET transistors being so selected that the total silicon area of said first and second power MOSFETs is substantially less than a silicon area associated with a single buck converter circuit having the same input and output voltages and the same output current as those of said cascaded buck converter circuit.

5,006,783

THREE PHASE VOLTAGE REGULATOR SYSTEM USING TERTIARY WINDING TRANSFORMER

Dale C. Corel, Elk Grove Village; Anthony Tamosaitis, Addison, and Pradeep Narechania, Long Grove, all of Ill., assignors to General Signal Corporation, Rochester, N.Y.

Filed Oct. 16, 1989, Ser. No. 421,903
Int. Cl.[5] G05F 1/30
U.S. Cl. 323—263 5 Claims



1. A three phase voltage regulator adapted to regulate voltages supplied from a three wire input source without a neutral which comprises transformer means having three phase primary windings and three phase secondary windings, said secondary windings having an output for connection to a three phase load, said transformer means also having a three phase tertiary winding having three windings at least individual ones of which are coupled to said primary windings and said secondary windings, so as to provide coupled primary, secondary and tertiary windings for each respective phase, voltage regulating means connected to said primary windings for keeping the voltage across said primary windings substantially constant, wherein said regulating means is connected in series with said primary windings, and wherein said regulating means comprises means for applying voltage form said tertiary windings to said primary windings.

5,006,784

THYRISTOR ON-LOAD CHANGE-OVER SWITCH

Ernst Sonntagbauer, Vienna, Austria, assignor to Elin-Union, Vienna, Austria

PCT No. PCT/AT88/00045, § 371 Date Dec. 6, 1989, § 102(e) Date Dec. 6, 1989, PCT Pub. No. WO88/10582, PCT Pub. Date Dec. 29, 1988
PCT Filed Jun. 14, 1988, Ser. No. 458,735
Claims priority, application Austria, Jun. 25, 1987, 1601/87
Int. Cl.[5] H01F 29/04
U.S. Cl. 323—343 2 Claims

1. An arrangement in an on-load change-over switch of an on-load tap changer for uninterrupting switch-over of the regulating winding of a transformer, comprising:

a regulating stage of the regulating winding;

said regulating stage containing a higher winding tap and a lower winding tap;

at least two selector contacts;

at least two permanent contacts;

conductors respectively connecting said at least two selector contacts and said at least two permanent contacts;

a common output line;

said higher winding tap and said lower winding tap being respectively connected to said common output line through respective ones of said at least two selector contacts and said at least two permanent contacts for conducting load current from a respective one of said higher winding tap and said lower winding tap to said common output line;

a first change-over switch;

said first change-over switch having a root connection and two switching contacts respectively connected to said higher winding tap and said lower winding tap;

said two switching contacts of said first change-over switch being respectively connected to said conductors respectively connecting said at least two selector contacts and said at least two permanent contacts;

a load relief circuit interconnecting said root connection of said first change-over switch and said common output line;

said first change-over switch switching between said higher winding tap and said lower winding tap such that said load current is briefly passed to said load relief circuit;

said load relief circuit containing a second change-over switch and a thyristor circuit;

said thyristor circuit being connected in series with said second change-over switch and containing two thyristors in antiparallel connections;

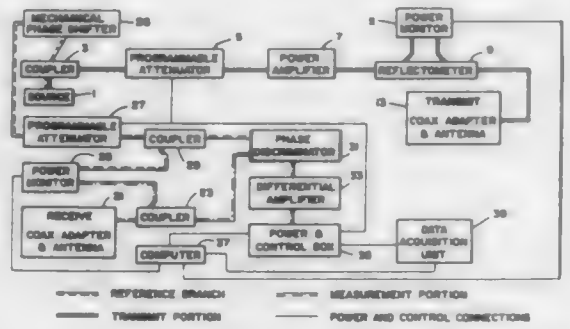
said load relief circuit further containing a series connection of a transition resistor and a bridging-over switch;

said series connection of said transition resistor and said bridging-over switch being connected to said common output line;

said second change-over switch containing two switching contacts;

one of said two switching contacts of said second change-

over switch being directly connected to said root connection of said first change-over switch; and



an other one of said two switching contacts of said second change-over switch being connected to said root connection of said first change-over switch through said transition resistor.

5,006,785

MICROWAVE OIL SATURATION SCANNER

David E. Revus, Yorba Linda, and Russell E. Boyer, Fullerton, both of Calif., assignors to Chevron Research Company, San Francisco, Calif.

Continuation of Ser. No. 855,539, Apr. 23, 1986, Pat. No. 4,764,718. This application Aug. 22, 1988, Ser. No. 234,984
The portion of the term of this patent subsequent to Mar. 10, 2004, has been disclaimed.
Int. Cl.[5] G01N *22/00*
U.S. Cl. 324—639 13 Claims

1. A microwave oil saturation scanner for measuring multiple fluid flow including oil and water having

(A) a transmit portion, comprising:

a source of microwave radiation;

a signal generated from said source;

means to control the strength of the signal from the microwave source connected to said microwave source;

means to transmit the signal through a sample, said transmit means is connected to said means to control the strength of the signal;

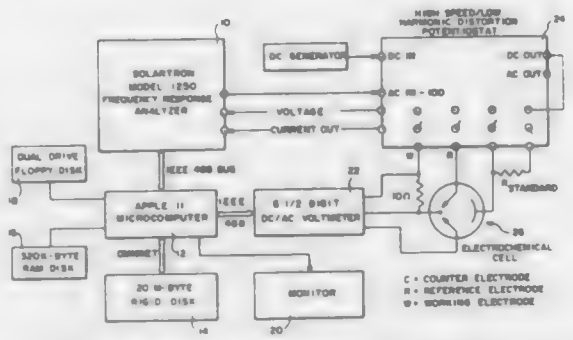
means to measure the strength of the signal that is transmitted, connected to said control means and said transmit means; and

(B) a measurement portion, comprising:

means to receive the signal that has been transmitted through the sample;

means to monitor the strength of the received signal connected to said receiving means;

means to control the strength of the signal that has been transmitted, said means being connected to said monitor means; and



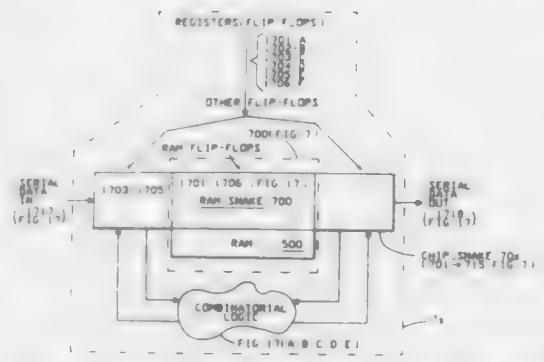
means to compare the signal that is transmitted, with the received signal and determine the amount of attenuation and phase angle shift of the received signal.

5,006,786

DEVICE FOR IN SITU MONITORING OF CORROSION RATES OF POLARIZED OR UNPOLARIZED METALS

Michael C. H. McKubre, San Mateo County, and Barry C. Syrett, Santa Clara County, both of Calif., assignors to Electric Power Research Institute, Inc., Palo Alto, Calif.

Continuation of Ser. No. 353,189, May 16, 1989, abandoned, which is a continuation of Ser. No. 38,164, Apr. 14, 1987, abandoned, which is a continuation-in-part of Ser. No. 576,119, Feb. 2, 1984, Pat. No. 4,658,365. This application May 3, 1990, Ser. No. 518,256
Int. Cl.[5] G01N *27/26*
U.S. Cl. 324—71.2 8 Claims



1. A method for continuous measurement of corrosion rate in a non-coated metal component submerged in an electrolyte comprising the steps of applying a moderate amplitude sinusoidal voltage perturbation having an applied fundamental frequency f to the corroding metal component, and analyzing the harmonic current response arising because of the energy needed to remove an electron from a metal to make an ion at a plurality of frequencies which are multiples or harmonics of the applied fundamental frequency f to calculate a dissolution current as a representative measure of corrosion, the harmonic current response being a function of said frequency harmonics arising in response to the sinusoidal voltage perturbation with no DC variation of potential.

5,006,787

SELF-TESTING CIRCUITRY FOR VLSI UNITS

Haluk Katircioglu, Irvine; John A. De Beule, Rancho Santa Margarita, and Debaditya Mukherjee, El Toro, all of Calif., assignors to Unisys Corporation, Blue Bell, Pa.

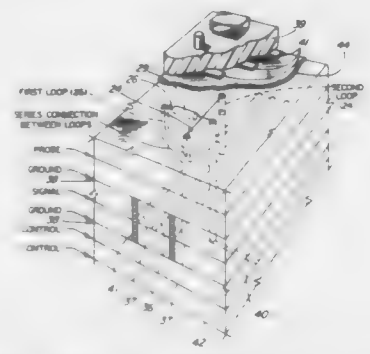
Filed Jun. 12, 1989, Ser. No. 364,411
Int. Cl.[5] G01R *31/28*
U.S. Cl. 324—73.1 15 Claims

1. In a VLSI integrated circuit chip structure which includes combinatorial logic circuitry, and having build-in self-test circuitry, said self-test circuitry having registers and flip-flops controllable as latches or as multiple function shift registers, the combination comprising:

(a) means for converting said registers into multifunction shift registers (MFSRs);

(b) means for selecting one of said registers as a test data generator to generate test data while holding the other registers, except for one output register;

(c) means for placing said test data generated into the said output register as a signature;



(d) means for accessing said signature for comparison against a standard reference signature.

5,006,788

METHOD AND APPARATUS FOR MONITORING ELECTROMAGNETIC EMISSION LEVELS

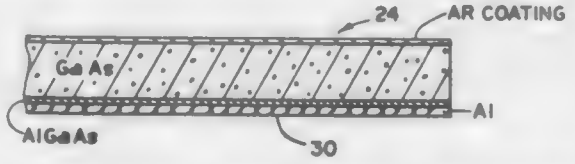
Richard R. Goulette, Arnprior; Stanilus K. Xavier, Kanata, and Raymond L. Greenfield, Nepean, all of Canada, assignors to Northern Telecom Limited, Montreal, Canada

Division of Ser. No. 890,717, Jul. 30, 1986, Pat. No. 4,829,238. This application Dec. 28, 1988, Ser. No. 291,280
Claims priority, application Canada, Mar. 27, 1986, 505485
Int. Cl.[5] G01R *31/28*
U.S. Cl. 324—95 16 Claims

1. A method of diagnosing faults in a printed circuit board, the method comprising the steps of:

energizing a printed circuit board which is known to be good and mapping radio frequency emissions from said printed circuit board known to be good to obtain a reference signature;

energizing a printed circuit board under test and mapping radio frequency emissions from said printed circuit board under test to obtain a test signature; and



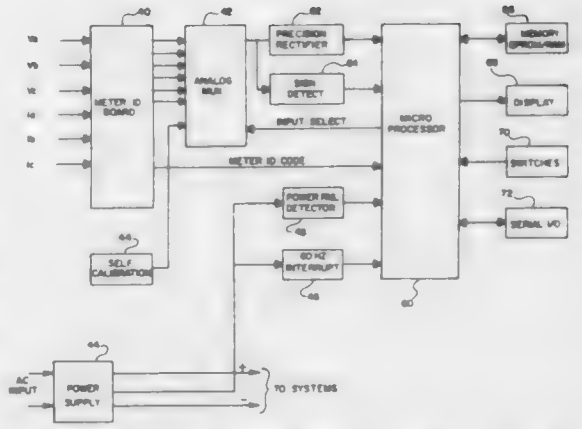
comparing the test signature to the reference signature, the presence and location of differences between the test signature and the reference signature indicating the presence and location of faults in the printed circuit board under test.

5,006,789

ELECTRO-OPTIC SIGNAL MEASUREMENT

Steven Williamson, Ann Arbor, Mich., assignor to The University of Rochester, Rochester, N.Y.

Division of Ser. No. 355,514, May 23, 1989, Pat. No. 4,928,058. This application Mar. 12, 1990, Ser. No. 491,785
Int. Cl.[5] G01R *19/00, 31/00;* G02F *1/09*
U.S. Cl. 324—96 7 Claims



1. An electro-optic electrical field probe for measuring an electrical signal which produces a field comprising a body of electro-optic material which changes polarization of light passing therethrough in accordance with the Pockels effect and which comprises a body of semi-conductor electro-optic material having ions of at least one element with a lower atomic number Z, then the atomic number of the elements of said electro-optic material implanted therein to reduce the photoconductivity thereof, and means for disposing said body in the vicinity of said field.

5,006,790

ELECTRONIC THERMAL DEMAND MODULE

William C. Beverly, II, Davidson; Michael B. Dalton, Pineville, and David Q. Gaddis, Charlotte, all of N.C., assignors to Appalachian Technologies Corporation, Charlotte, N.C.

Filed Oct. 19, 1987, Ser. No. 109,776
Int. Cl.[5] G01R *21/133, 5/22*
U.S. Cl. 324—104 4 Claims

2. Electronic apparatus coupled to receive from a metering connection a plurality of analog voltages representing the instantaneous line voltage and load current values of at least one phase of an electrical utility service entrance and utilizing said analog voltages to selectively calculate and selectively display parameters related to the existing load conditions, said apparatus comprising in combination:

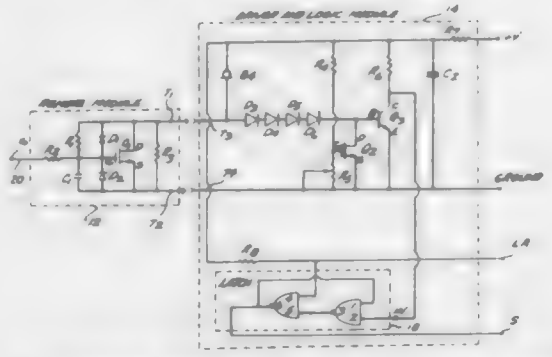
(a) means for sampling said analog voltage and repetitively generating digital numbers having a predetermined relationship to said analog voltages;

(b) means for correcting said digital numbers for variations introduced by said means for sampling;

(c) means utilizing said digital numbers to calculate said selected parameters in accordance with predetermined mathematical functions;

(d) means for selectively displaying digital numbers representing the calculated values of said selected parameters in alphanumeric form;

(e) means for selectively setting the digital number representative of selected ones of said parameters to a selected value in response to an input signal; and



(f) means for initiation of calibration, display and other sequences associated with said means utilizing said digital numbers.

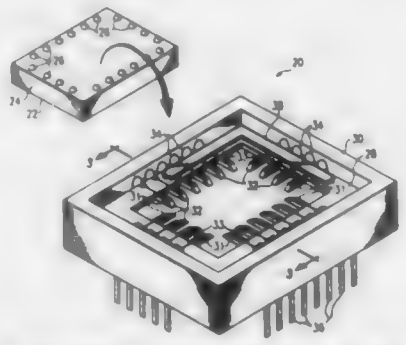
5,006,791

ELECTROSTATIC DETECTOR AND METHOD FOR DETECTING CONDUCTORS

Dan A. Cross, Seattle, Wash., assignor to The Boeing Company, Seattle, Wash.

Filed Nov. 18, 1985, Ser. No. 798,996
Int. Cl.[5] G01R *19/14, 31/08*
U.S. Cl. 324—133 **18 Claims**

1. A detector for detecting a conductive region, comprising:
a conductive detection electrode for contactung the conductive region;
a capacitor for establishing an electrical charge on said detection electrode to place said detection electrode at a predetermined electrical potential;
means for detecting a decrease in said electrical potential of said detection electrode when said conductive region contacts said detection electrode;
first and second circuit terminals connectable to a source of operating potential;
a current source for supplying a control current in response to said operating potential, the first end of said current source being connected to said first circuit terminal and the second end of said current source being connected to the first terminal of said capacitor, the second terminal of said capacitor being connected to said second circuit terminal, the first terminal of said capacitor also being connected to said detection electrode; and
a first transistor switch having a control electrode connected to the first terminal of said capacitor, said first transistor switch for directing said control current to said second circuit terminal when said potential of said detection electrode remains at a predetermined potential and for blocking said control current when said potential on said detection electrode decreases from said predetermined level.



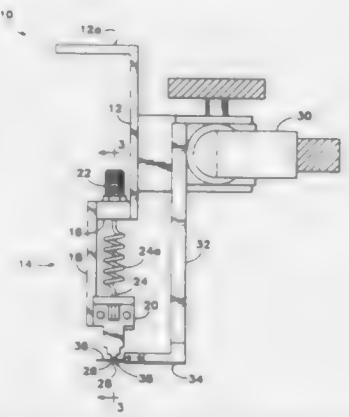
5,006,792

FLIP-CHIP TEST SOCKET ADAPTOR AND METHOD

Satwinder Malhi, Garland; Oh K. Kwon, and Shivaling S. Mahant-Shetti, both of Richardson, all of Tex., assignors to Texas Instruments Incorporated, Dallas, Tex.

Filed Mar. 30, 1989, Ser. No. 330,839
Int. Cl.[5] G01R *1/07, 1/04*
U.S. Cl. 324—158 F **29 Claims**

1. A socket adaptor for testing a bare integrated circuit chip having solder bump leads, comprising:
a substrate constructed and arranged to receive and hold the chip;
a plurality of pressure-sensitive contacts on said substrate matched to solder bump leads on the chip, said contacts comprising cantilever beams formed from a semiconductor material; and



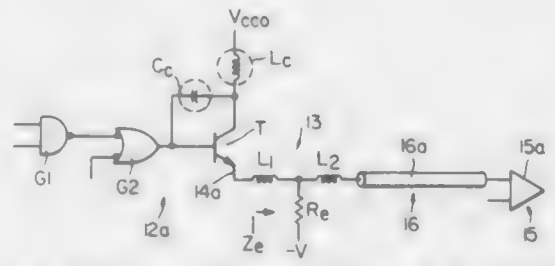
a package for holding said substrate such that the chip may be tested.

5,006,793

HIGH-FREQUENCY ACTIVE PROBE HAVING REPLACEABLE CONTACT NEEDLES

K. Reed Gleason, Portland, and Keith E. Jones, Aloha, both of Oreg., assignors to Cascade Microtech, Inc., Beaverton, Oreg.

Filed Jun. 8, 1989, Ser. No. 364,091
Int. Cl.[5] G01R *1/06, 31/02*
U.S. Cl. 324—158 P **4 Claims**



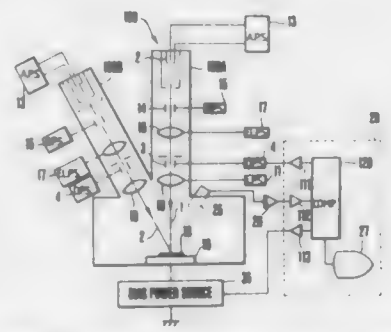
1. A circuit probe for providing two electrical connections to a circuit under test, comprising:
(a) an elongate transmission line having a first conductor and a second conductor, said transmission line having a longitudinal axis;
(b) first contact needle means connected to said first conductor of said transmission line for contacting a first selected location on said circuit under test;
(c) a conductive surface connected to said second conductor of said transmission line;
(d) wiper means for conductively contacting said conductive surface at a variable contact position, said wiper means and said conductive surface being movable with respect to each other so as to vary said contact position;
(e) second contact needle means, attached to said wiper means and spaced from said first contact needle means, for contacting a second selected location on said circuit under test; and
(f) selectively actuatable positioning means remote from said wiper means and from said conductive surface for varying said contact position so as to adjust the relationship between said first contact needle means and said second needle means, and linkage means remotely operatively interconnecting said positioning means with at least one of said wiper means and said conductive surface for causing relatively movement therebetween in response to actuation of said positioning means.

5,006,794

MODULE FOR PREVENTING INSTABILITY IN INTEGRATED CIRCUIT TESTERS

Laszlo V. Gal, Poway; James E. Judy, Jr., and Kenneth C. Prentice, both of San Diego, all of Calif., assignors to Unisys Corporation, Blue Bell, Pa.

Filed Mar. 21, 1988, Ser. No. 188,021
Int. Cl.[5] G01R *31/02, 1/06*
U.S. Cl. 324—158 R **11 Claims**



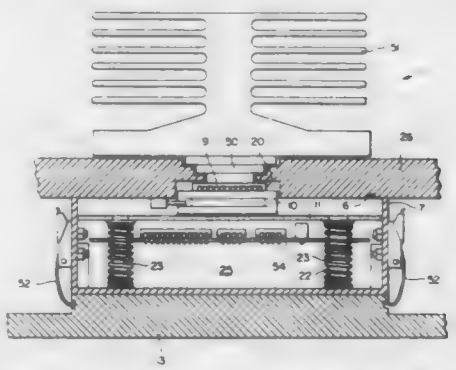
1. A system which tests the operability of an integrated circuit chip; said system being of a type in which a plurality of output transistors on said chip send output signals over respective signal lines to a tester unit which checks the state of the output signals; wherein:
each output transistor has an input node and feedback from said output signals to said input node; and,
disposed between said chip and said signal lines is an interface module which prevents said feedback from inducing oscillations in said output signals;
said interface module being characterized as including a plurality of phase shifting circuits that respectively couple said output signals from said output transistors onto said signal lines to said tester unit;
each phase shifting circuit including an inductor which together with the input impedance of one signal line to said tester unit produces a net positive phase shift of up to +90°.

5,006,795

CHARGED BEAM RADIATION APPARATUS

Masahiro Yoshizawa; Akira Kikuchi, both of Kanagawa; Kou Wada, Tokyo; Minpei Fujinami, Tokyo, and Nobuo Shimazu, Tokyo, all of Japan, assignors to Nippon Telephone and Telegraph Public Corporation, Japan

Filed Jun. 24, 1986, Ser. No. 878,015
Claims priority, application Japan, Jun. 24, 1985, 60-136147; Jun. 24, 1985, 60-136148; Aug. 5, 1985, 60-171028
Int. Cl.[5] G01B *15/00;* **G01R** *31/26*
U.S. Cl. 324—158 R **23 Claims**



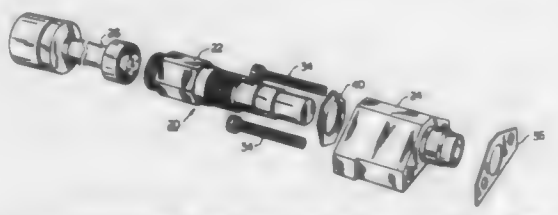
1. A charged beam radiation apparatus comprising:
auxiliary charged beam emitting means for emitting an auxiliary charged beam having a given acceleration voltage onto a predetermined portion of an electronic device which includes a pattern to be measured; said given acceleration voltage selected to produce a secondary emission ratio of less than 1 to charge said predetermined portion of said electronic device to a negative potential;
main charged beam emitting means for emitting a main charged beam having an acceleration voltage lower than said given acceleration voltage of said auxiliary charged beam onto said predetermined portion and the vicinity of said predetermined portion to generate secondary electrons;
secondary electron detecting means for detecting secondary electrons generated from a portion irradiated by said main charged beam to generate a secondary electron signal waveform; and
means for measuring the size of the pattern to be measured by detecting the edge of said pattern from said secondary electron signal waveform generated by said detecting means.

5,006,796

TEMPERATURE CONTROL INSTRUMENT FOR ELECTRONIC COMPONENTS UNDER TEST

David P. Burton, Parteen; Paul A. Dillon, Foxrock, and Malcolm I. Stephenson, Adare, all of Ireland, assignors to Irish Transformers Limited, Limerick, Ireland

Filed Oct. 27, 1988, Ser. No. 263,232
Claims priority, application Ireland, Oct. 28, 1987, 2886/87; Mar. 11, 1988, 713/88
Int. Cl.[5] G01R *31/02;* **F28F** *7/00*
U.S. Cl. 324—158 F **10 Claims**



1. A temperature control instrument for an electronic component under test comprising:
a body;
a testing enclosure in said body for the component;
a socket means mounted within said testing enclosure for the reception of the component;
a thermoelectric device for heating or cooling said enclosure, said thermoelectric device having a heat transfer active face and and a reference face, said reference face being maintained at a substantially constant temperature, and a controller comprising a control circuit for controlling operation of the thermoelectric device by varying the magnitude and direction of current applied to the thermoelectric device to alter the temperature of said active face;
a mounting assembly for mounting said socket means and thermoelectric device separately and relatively movable with respect to each other between a closed position in which said active face is in contact with the electronic component and an open position in which said active face and component are spaced apart; and
temperature sensing means operatively connected to said controller for sensing temperature within the enclosure.

5,006,797

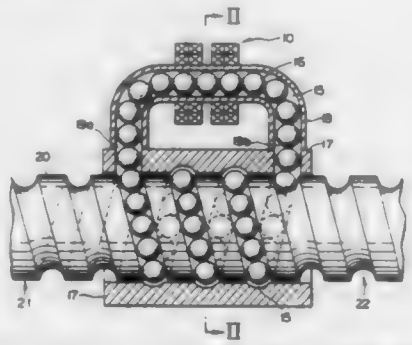
ELECTROMAGNETIC SENSOR ASSEMBLY

William L. Smith, Blue Ridge Overlook, Brevard, N.C. 28712

Filed Mar. 2, 1989, Ser. No. 317,967
Int. Cl.[5] G01P *3/48, 3/54;* G01B *7/14;* G01R *33/00*
U.S. Cl. 324—173 11 Claims

1. A sensor assembly for providing an electrical signal representative of the velocity of a movable body, comprising:

(a) sensor means for sensing the velocity of the body and providing said signal; and



(b) mounting means disposed close to the body for locating said sensor means in a predetermined position with respect to said body, wherein said mounting means includes a mounting block having a passageway extending through said block for receiving said sensor means, first means for restricting the movement of said sensor means along a direction coexistent with respect to the longitudinal axis of said sensor means and second means for restricting the movement of said sensor means along the direction coexistent with respect to the longitudinal axis of said sensor means to a predetermined position from said body, wherein said second means for restricting the movement of said sensor means along the direction coexistent with respect to the longitudinal axis of said sensor means to the predetermined position from said body include a base plate having an aperture coexistent with the longitudinal axis of said sensor means, said aperture being sized to permit a predetermined portion of said sensor means to extend therethrough, wherein said base plate having an aperture coexistent with the longitudinal axis of said sensor means includes an elongated tubular portion having one end attached to said base plate, said barrel portion extending along the direction coexistent with respect to the longitudinal axis of said sensor means and being sized to permit at least a portion of said sensor means to extend therein.

5,006,798

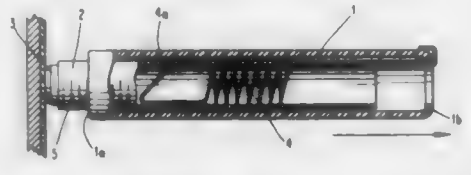
POSITION DETECTION USING RELUCTANCE CHANGES INDUCED BY DISPLACEMENT OF METALLIC BALLS

Yuji Matsuki, Sayama, and Waturu Ichikawa, Tokyo, both of Japan, assignors to Kabushiki Kaisha SG, Tokyo, Japan

Filed Feb. 8, 1990, Ser. No. 476,799
Claims priority, application Japan, Feb. 9, 1989, 1-13555[U]
Int. Cl.[5] G01B *7/14;* G01R *33/00*
U.S. Cl. 324—207.17 7 Claims

1. A position detection device for a linear guide, comprising:

a linear guide including a linear guide member, a movable member being displaceable relative to said linear guide member and a ball bearing assembly provided on said movable member in a portion which comes in sliding contact with said linear guide member, said ball bearing assembly having a casing and a succession of plural metallic balls disposed within the casing to form an endless ball array with each adjacent one of said balls being in close contact with each other and said balls being rotatable and continuously displaceable in a closed loop in accordance with the relative displacement of said movable member; and



a coil assembly provided on a part of said casing and including a coil member to be excited by an AC signal so that a magnetic path is formed through said ball located at said part of said casing and a reluctance change is produced in the magnetic path in accordance with displacement of said balls, one cycle of said reluctance change being determined by displacement corresponding to the diameter of said balls, and said coil assembly producing an output signal responsive to said reluctance change.

5,006,799

LOW COST MAGNETIC COATING THICKNESS GAUGE WITH HOLDING MAGNET, BIAS SPRING AND HOLDING FORCE INDICATOR

John G. Pfanstiehl, 880 Mandalay S-407, Clearwater Beach, Fla. 34630

Filed Dec. 1, 1988, Ser. No. 278,348
Int. Cl.[5] G01B *7/10, 5/06*
U.S. Cl. 324—230 38 Claims

1. A device that measures the magnetic holding force of a material being tested, comprising:

a first elongate housing member;

a second elongate housing member slidably received within said first housing member;

said first housing member and said second housing member being manually held in use with their respective longitudinal axes positioned in a substantially orthogonal relationship to said material being tested with one of said housing members remaining in position with the material being tested while the other said housing member is telescopically pulled away from said material being tested;

a permanent magnet;

said magnet carried by one end of one of said housing members with a portion of said magnet protruding beyond said end of said housing member;

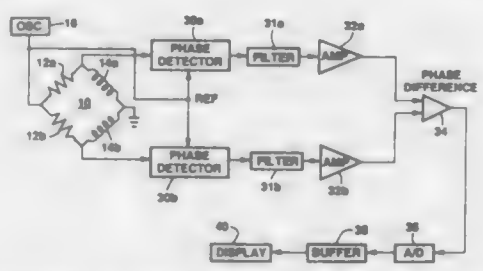
whereby said magnet is placed in contact with said material being tested; said magnet holding said one of said housing members to said material with said magnetic holding force which is inversely proportional to the thickness of the nonmagnetic surface coating which covers the ferrous substrate of said material being tested while the other said housing member is pulled away from said material being tested;

a biasing means comprised of a coiled spring having a leading end and a trailing end;

said ends disposed in interconnecting relation to said first housing member and said second housing member;

said trailing end of said biasing means fixedly secured to said first housing member and said leading end of said biasing means fixedly secured to said second housing member to provide a bias which increases in linear fashion with the distance said first housing member is pulled telescopically out from said second housing member until the bias equals said magnetic force holding said magnet in contact with said surface being tested;

a first indicia means in the form of a graduated scale, being provided on said second housing member;



whereby said scale moves relative to said first housing member as one of said housing members is pulled away from said material being tested and whereby the magnetic holding force of said material is indicated by registration of said indicia means and said first housing member when said holding force is equal to the bias provided by said biasing means.

EDDY CURRENT IMAGING APPARATUS AND METHOD USING PHASE DIFFERENCE DETECTION

Kristina H. V. Hedengren; Donna C. Hurley, both of Schenectady, and John D. Young, Rexford, all of N.Y., assignors to General Electric Company, Schenectady, N.Y.

Filed Nov. 6, 1989, Ser. No. 431,791
Int. Cl.[5] G01R *33/12;* G01N *27/82*
U.S. Cl. 324—233 18 Claims

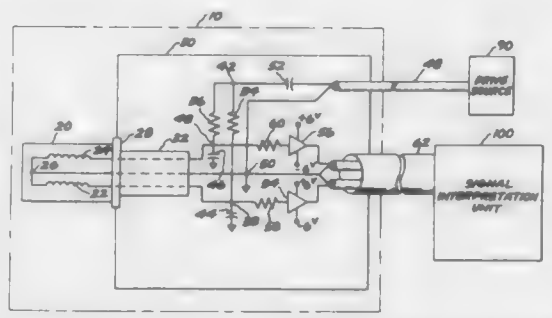
1. Apparatus for eddy current imaging using phase difference detection of an object, said apparatus comprising:

a pair of coils, at least one of said coils being adapted to be disposed proximate to the object;

means for causing relative motion between the object and said coils;

an oscillator coupled to said coils for causing said at least one of said coils to create eddy currents in the object;

a pair of phase detectors coupled to said oscillator and to said coils, said oscillator providing signals having the same phase to both of said phase detectors; and



means for comparing the output signals from said phase detectors.

5,006,801

EDDY CURRENT INSPECTION PROBE WITH PROBE COIL RESONACE REDUCTION

John D. Young, Rexford, N.Y., assignor to General Electric Company, Schenectady, N.Y.

Filed Jun. 2, 1989, Ser. No. 360,687
Int. Cl.[5] G01N *27/82, 27/72;* G01R *33/00, 33/12*
U.S. Cl. 324—238 9 Claims

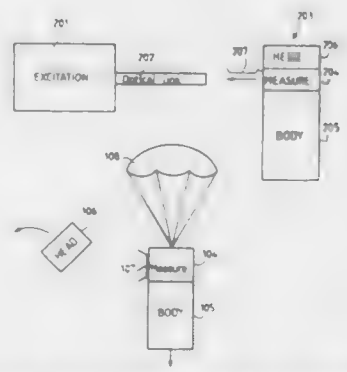
1. An inspection instrument of the type which reacts to induced eddy currents in a workpiece to be inspected, said instrument comprising:

a probe including a first probe coil and a second probe coil;

a bridge circuit including said first probe coil connected in a first bridge arm, said second probe coil connected in a second bridge arm, a first and a second resistor connected in third and fourth bridge arms respectively, said first and second bridge arms connected at a grounded first bridge node, said first and third bridge arms connected at a second bridge node, said second and fourth bridge arms connected at a third bridge node, said third and fourth bridge arms connected at a fourth bridge node, said first and fourth bridge nodes constituting input terminals for receiving an AC drive signal, and said second and third bridge nodes constituting output terminals;

first and second capacitors coupled between said second and third bridge nodes respectively and ground;

means for connecting said bridge output terminals to a remote signal interpretation unit, said connecting means having a capacitive reactance value capable of producing undesired resonance conditions with said probe coil at the frequency of said AC drive signal; and



individual buffer means connected between each of said output terminals and said connecting means to isolate said capacitance reactance from said bridge circuit.

5,006,802

MAGNETIC DETECTION METHOD AND DEVICE FOR THE IMPLEMENTATION THEREOF

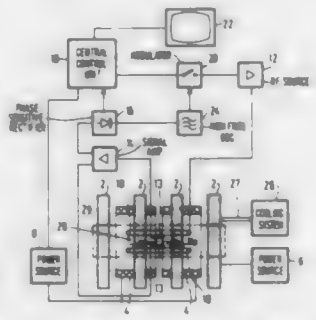
Martine Dolsy, Plaisaasier, France, assignor to Thomson-CSF, Puteaux, France

Filed Dec. 15, 1989, Ser. No. 451,154
Claims priority, application France, Dec. 20, 1988, 88 16804
Int. Cl.[5] G01R *33/26*
U.S. Cl. 324—304 11 Claims

1. A method for the measurement of the magnetic field by means of a helium-type releasable magnetometer, comprising excitation means and measuring means, comprising a helium cell, wherein this helium cell is excited, the excitation means and the measuring means are separated, these measuring means are released to make them go to the place where the measurement has to be made, and a measurement is made of the precession of the helium atoms under the effect of the magnetic field to be measured.

5,006,803

NUCLEAR MAGNETIC RESONANCE APPARATUS WITH SURFACE COIL DETECTION



Eddy B. Boskamp, and Rudolf Kemner, both of Eindhoven, Netherlands, assignors to U.S. Philips Corporation, New York, N.Y.

Continuation of Ser. No. 677,939, Dec. 4, 1984, abandoned. This application Mar. 26, 1987, Ser. No. 31,064

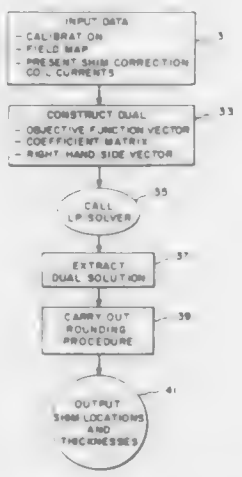
Claims priority, application Netherlands, May 25, 1984, 8401671

Int. Cl.[5] G01R *33/36*

U.S. Cl. 324—311 14 Claims

1. A nuclear magnetic resonance apparatus comprising means for generating a homogeneous main magnetic field in an examination space, means for generating gradient fields in said examination space, means, including a first coil, for generating a local, homogeneous, radio frequency magnetic field in said examination space, and means for detecting nuclear magnetic resonance signals generated in an object under examination disposed in said examination space, said detecting means comprising a measuring coil which is separate from said first coil and an electronic circuit for decoupling said measuring coil from said first coil during generation of said radio frequency field in said examination space.

5,006,804



METHOD OF OPTIMIZING SHIM COIL CURRENT SELECTION IN MAGNETIC RESONANCE MAGNETS

Bizhan Dorri, Clifton Park, N.Y., and Jay F. Beneach, Gaithersburg, Md., assignors to General Electric Company, Schenectady, N.Y.

Filed Dec. 4, 1989, Ser. No. 445,508

Int. Cl.[5] G01R *33/20*

U.S. Cl. 324—320 4 Claims

1. A method of shimming a magnet having correction coils, comprising the steps of:

(a) measuring the field strength in the bore of the magnet at a predetermined number of points;

(b) determining the field inhomogeneity from the measured field strengths;

(c) determining the field created by a fixed current in each shim coil operating alone, at each of the predetermined points;

(d) determining the shim correction coil currents using a linear programming solver to minimize the field inhomogeneity and the correction coil currents used in the shims, the correction coil currents being determined based on the measured field in the bore of the magnet and the field created by each of the shim coils when carrying a fixed current, with the correction coil currents each constrained to a maximum value which is adjusted for the current in the correction coils when the field strength in the bore of the magnet was measured;

(e) adjusting the currents in the correction coils to the determined values;

(f) measuring the field strength of the magnet and correction coils at the predetermined number of points in the magnet;

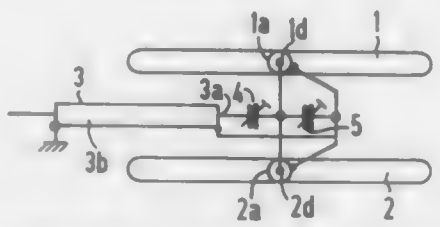
(g) determining the field inhomogeneity from the measured field strengths;

(h) comparing the field inhomogeneity to a desired value; and

(i) repeating steps d, e, f, g, and h until the field inhomogeneity is less than or equal the desired inhomogeneity.

5,006,805

SURFACE COIL ARRANGEMENT FOR USE IN A NUCLEAR MAGNETIC RESONANCE APPARATUS



Hartwig Ingwersen, Uttenreuth, Fed. Rep. of Germany, assignor to Siemens Aktiengesellschaft, Berlin and Munich, Fed. Rep. of Germany

Filed Sep. 20, 1989, Ser. No. 409,925

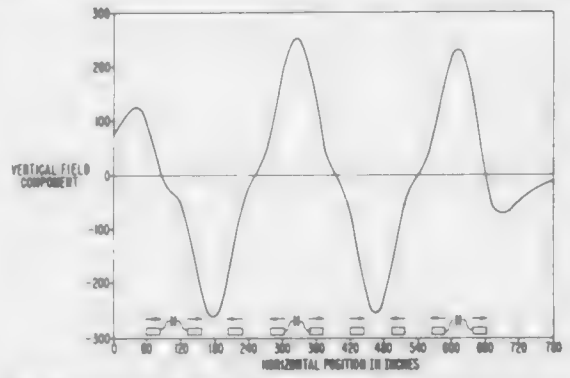
Claims priority, application Fed. Rep. of Germany, Sep. 23, 1988, 3832473

Int. Cl.[5] G01R *33/34*

U.S. Cl. 324—322 9 Claims

1. A surface coil system for use in a nuclear magnetic resonance apparatus comprising a surface coil arrangement having two identically constructed surface coils, said coils being disposed geometrically anti-parallel and being electrically connected to each other so that radio-frequency magnetic fields which uniformly penetrate both surface coils do not induce any resultant current, each surface coil being formed by a coaxial line section formed in a loop and having jacket shielding with a gap at one location in said loop, said coaxial line section having an inner conductor and having an end at which the jacket shielding and the inner conductor are electrically connected to the jacket shielding at an opposite end of said coaxial line section, with the loops of said two surface coils having opposite winding directions.

5,006,806



METHODS AND APPARATUS EMPLOYING PERMANENT MAGNETS FOR MARKING, LOCATING, TRACING AND IDENTIFYING HIDDEN OBJECTS SUCH AS BURRIED FIBER OPTIC CABLES

John B. Rippingale, Leesburg, Va.; Charles R. Upton, Silver Spring, Md.; Erick O. Schonstedt, Reston; Bradley L. Osman, Herndon, both of Va., and , assignors to Schonstedt Instrument Company, Reston, Va.

Continuation-in-part of Ser. No. 323,860, Mar. 15, 1989, abandoned. This application Oct. 30, 1989, Ser. No. 428,757

Int. Cl.[5] G01V *3/08, 3/165;* H01F *1/00;* F16L *55/00*

U.S. Cl. 324—326 15 Claims

8. In combination with an elongated non-magnetic object to be magnetically detected, a series of spaced permanent magnets on said object and extending along the length of said object, said magnets having magnetic axes parallel to the length of said object and being constructed and disposed so that magnetic fields of successive mangets add or subtract to produce a resultant magnetic field having a predetermined magnetic field signature including a series of peaks and valleys at points along a line substantially parallel to the length of said object, said series of permanent mangets including a plurality of pairs of successive magnets in which the magnets of each pair are constructed and disposed so that the magnetic fields thereof are additive to produce at a point along said line a peak or valley of greater magnitude than would be produced by the individual magnets of the pair, whereby a magnetic field detector moved along said line produces an output corresponding to said peaks and valleys in order to locate, trace and identify said object.

5,006,807

METHOD FOR DETERMINING UNDERSHOOT RESISTANCE OF AN ELECTRONIC DEVICE

Steven M. Blum, 3586 Ridge Blvd., Palm Harbor, Fla. 34684

Filed Dec. 27, 1988, Ser. No. 290,614

Int. Cl.[5] G01R *31/28*

U.S. Cl. 324—537 17 Claims

1. A method for determining the undershoot resistance of an electronic device having input and output pins comprising the steps of:

a. selecting an input pin to test;

b. masking output pins logically connected to said input pin;

c. providing a first high voltage to at least one nonselected input pin;

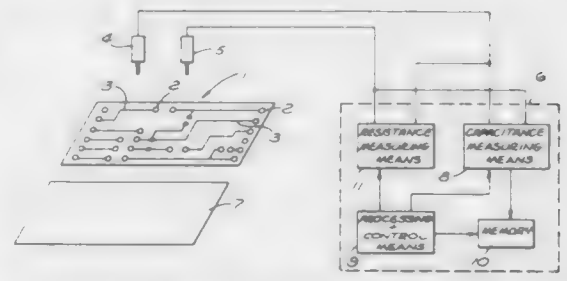
d. selecting a first pulse width;

e. selecting a first low voltage;

f. applying a voltage spike having said low voltage and pulse width to said selected input pin; and

g. monitoring nonmasked output pins for disturbances in their output voltage levels.

5,006,808



TESTING ELECTRICAL CIRCUITS

Vivian C. Watts, Lydiard Way, United Kingdom, assignor to Bath Scientific Limited, Wiltshire, United Kingdom

Continuation-in-part of Ser. No. 326,697, Mar. 21, 1989, abandoned. This application Aug. 22, 1989, Ser. No. 397,612

Int. Cl.[5] G01R *31/02*

U.S. Cl. 324—537 11 Claims

1. A method of testing for short circuits between networks of an electrical circuit comprising a plurality of such networks, the method comprising:

(a) measuring an impedance value between each of the networks and a reference;

(b) calculating, from the measured impedance values, (i) a first value, for the lowest impedance per unit length of track for a network comprising at least two points with at least one conductive track between them and (ii) a second value, for the lowest impedance of a network which comprises just a single point;

(c) identifying, from the measured impedance values, any two of the networks which have substantially the same measured impedance value;

(d) for any two such networks which have substantially the same measured impedance value, calculating a predicted lowest impedance value for those networks to be short-circuited together, using said first value and/or said second value, a knowledge of the geometrical characteristics of the two networks and their relative positions in the circuit; and

(e) effecting tests for short circuits only between any two networks which have substantially the same measured impedance value and for which this measured impedance value is greater than the predicted lowest impedance value for the two networks to be short-circuited together.

5,006,809

APPARATUS FOR MEASURING THE ELECTRICAL RESISTANCE OF A TEST SPECIMEN

Paul Mang, and Hubert Driller, both of Schmitten, Fed. Rep. of Germany, assignors to Manin GmbH & Co., Weilrod, Fed. Rep. of Germany

Filed Feb. 13, 1990, Ser. No. 479,529

Claims priority, application European Pat. Off., Feb. 16, 1989, 89102685

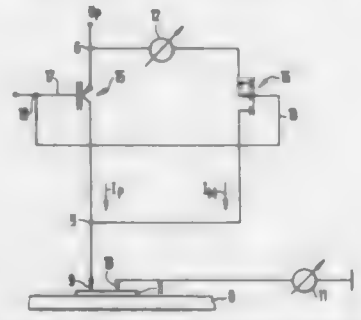
Int. Cl.[5] G01R *27/08*

U.S. Cl. 324—715 18 Claims

1. An apparatus for measuring a resistance of a test specimen, said apparatus comprising:

first and second test probe terminal means each for electrically connecting to the test specimen;

supply terminal means for applying thereto a reference power source;



current measuring means, coupled to said second test probe terminal means, for measuring an electric current flowing through the test specimen;

first semiconductor switching means, coupled to said first test probe terminal means and said supply terminal means, for activating to allow an electric current to pass therethrough; and,

first voltage measuring means, coupled to said first semicon-

ductor switching means and said first test probe terminal means, for measuring a voltage across at least said first semiconductor switching means;

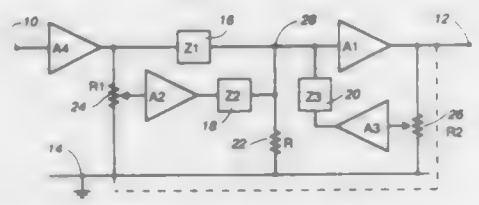
said first voltage measuring means including a serial connection of a first voltage measuring device and a second

semiconductor switching means for activating tc allow an electric current to pass therethrough;

said first semiconductor switching means including an insulated-gate-bipolar-transistor;

said seccnd semiconductor switching means including a field-effect transistor.

5,006,810



SECOND ORDER ACTIVE FILTERS

Petre Popescu, Kirkland, Canada, assignor to Northern Telecom Limited, Montreal, Canada

Filed Dec. 14, 1989, Ser. No. 450,790

Int. Cl.[5] H03B *1/00*; **H03K** *5/00*; **H04B** *1/10*

U.S. Cl. 328—167 **20 Claims**

1. A filter comprising:

an input terminal, an output terminal, and a common terminal;

a first reactance and a resistance coupled in series between the input and common terminals;

a first amplifier having an input coupled to a connection point between the first reactance and the resistance and having an output coupled to the output terminal;

a potential divider coupled between the output terminal and one of the input and common terminals;

a second amplifier having an input coupled to a tapping point of the potential divider and having an output; and

a second reactance coupled between the output of the second amplifier and the connection point;

wherein one of the reactances is inductive and the other is capacitive.

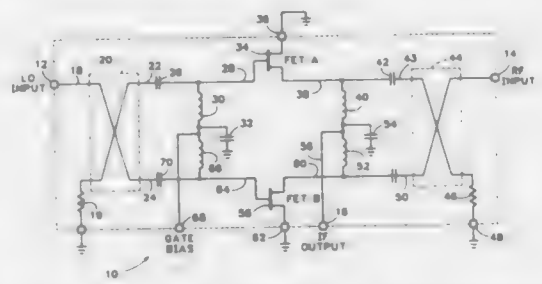
5,006,811

DUAL QUADRATURE FREQUENCY CONVERTER

Dennis A. Kruger, Tigard, Oreg., assignor to TriQuint Semiconductor, Inc., Beaverton, Oreg.

Filed Jan. 31, 1990, Ser. No. 472,972

Int. Cl.[5] H03D *1/18*



U.S. Cl. 329—354 **9 Claims**

1. Apparatus for demodulating a radio frequency signal comprising:

a first quadrature coupler having an input, a first output and a second output, said first output being connected to said input via a coupled path and said second output being connected to said input via a direct path;

means for generating a local oscillator signal on said coupler input;

a second quadrature coupler having an input, a first output and a second output, said first output being connected to said input via a coupled path and said second output being connected to said input via a direct path;

means for applying the radio frequency signal to said second coupler input;

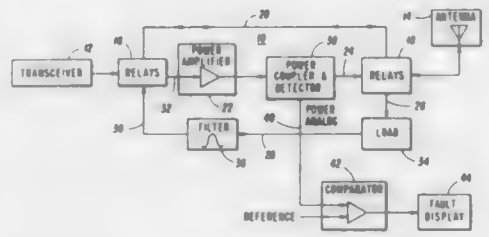
a first mixer for mixing the signals appearing on said first outputs;

a second mixer for mixing the signals appearing on said second outputs;

means for filtering the signals so mixed; and

means for adding the filtered signals.

5,006,812



POWER AMPLIFIER WITH BUILT-IN TEST CIRCUIT

Alan R. Erickson, Cedar Rapids, Iowa, assignor to Rockwell International Corporation, El Segundo, Calif.

Filed Aug. 1, 1989, Ser. No. 388,180

Int. Cl.[5] G01R *35/00*

U.S. Cl. 330—2 **18 Claims**

1. A test circuit for use in checking the operation of a power amplifier, comprising:

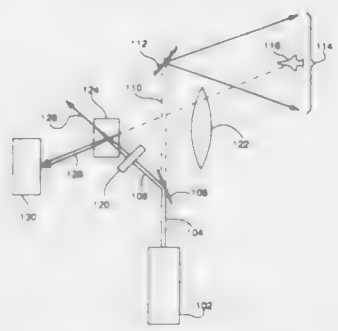
relay means for switching said amplifier into a feedback mode in which the output of said amplifier is returned to its input;

attenuator means for attenuating the output of said amplifier as it is fed back as input to said amplifier and dissipating the power generated by said amplifier;

filter means for filtering the output of said amplifier to pass only a narrow band of frequencies before said output is fed back as input to said amplifier; and

comparison means for checking the power level of the output of said amplifier.

5,006,813



NONLINEAR OPTICAL DOPPLER IMAGING AMPLIFIER

Mohsen Khoshnevisan, Newbury Park, and Pochi A. Yeh, Thousand Oaks, both of Calif., assignors to Rockwell International Corporation, El Segundo, Calif.

Filed Feb. 10, 1986, Ser. No. 827,583

Int. Cl.[5] H01S *3/00*; **H03F** *7/00*; **G02B** *5/23*

U.S. Cl. 330—4.3 **14 Claims**

1. A nonlinear optical receiver for imaging a distant moving object, comprising:

a source of coherent light of frequency ω for illuminating the object, the portion of the source light which is reflected from the object constituting a signal beam;

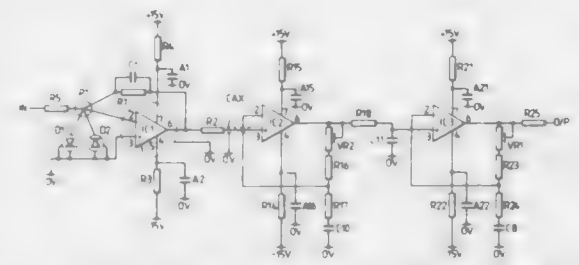
a reference beam of coherent light of frequency ω;

a frequency shifting element for changing the frequency of the reference beam to match the Doppler-shifted frequency of the signal beam; and

a photorefractive element for receiving the signal and reference beams and coherently amplifying the signal beam by two-wave mixing, the sum of the distance between the coherent light source and the object and between the object and the photorefractive element being less than the coherence length of the coherent light.

5,006,814

CURRENT AMPLIFIER



Colin J. Wilson, Hertfordshire, England, assignor to W.A. Technology Limited, Cambridge, England

Filed Oct. 10, 1989, Ser. No. 420,111

Claims priority, application United Kingdom, Oct. 26, 1988, 8825096

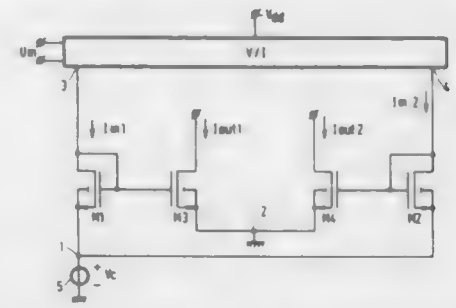
Int. Cl.[5] H03F *3/68*

U.S. Cl. 330—107 **13 Claims**

1. A current amplifier including two stages, a first stage formed by a primary operational amplifier connected in a virtual earth feedback configuration and having a feedback loop formed by a resistor and capacitor connected in parallel so that the primary operational amplifier has a frequency characteristic with a substantially flat frequency response up to a predetermined frequency and thereafter the frequency response rolls off at a predetermined rate, and a second stage including another operational amplifier connected in one of a virtual earth and non-inverting feedback configuration having a frequency characteristic chosen to provide in combination with the frequency characteristic of the primary amplifier a desired operating range for the amplifier, characterised in that the said predetermined frequency lies between the frequency extremes of the operating range and the frequency characteristic of the second stage has a substantially constant gain up to said predetermined frequency and a gain matched with and complementary to the roll-off of the primary operational amplifier above the predetermined frequency so that the overall frequency response of the current amplifier is substantially flat over its operating range.

5,006,815

LINEAR-GAIN AMPLIFIER ARRANGEMENT



Eric A. M. Klumperink, Lichtenvoorde, and Evert Seevinck, Eindhoven, both of Netherlands, assignors to U.S. Philips Corporation, New York, N.Y.

Filed Oct. 6, 1989, Ser. No. 418,414

Claims priority, application Netherlands, Oct. 26, 1988, 8802631

Int. Cl.[5] H03F *3/45*

U.S. Cl. 330—253 **23 Claims**

1. A liner-gain amplifier arrangement which comprises: a current-amplifying cell comprising a first and a second current-mirror circuit of which each comprises at least an input transistor and an output transistor to form a first and a second differential pair, respectively, and means coupled to the current-amplifying cell for defining the gain of the amplifier arrangement, wherein the transistors are all of the field-effect type and are biased to operate in their saturation regions, the input transistors being connected to a voltage-to-current converter which is responsive to an applied input voltage so as to supply difference currents which are related to said input voltage by a square-law function.

5,006,816

SEMICONDUCTOR INTEGRATED CIRCUIT INCLUDING DIFFERENTIAL TRANSISTOR CIRCUIT HAVING A PAIR OF FETS

Nobuo Koide, Tokyo, Japan, assignor to Kabushiki Kaisha Toshiba, Kawasaki, Japan

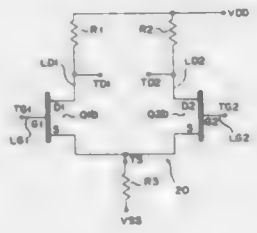
Continuation of Ser. No. 373,829, Jun. 29, 1989, abandoned. This application Jun. 1, 1990, Ser. No. 530,455

Claims priority, application Japan, Jun. 30, 1988, 63-163286

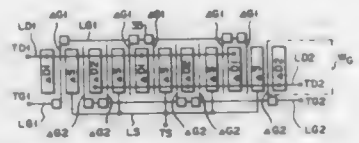
Int. Cl.[5] H03F *3/45*

U.S. Cl. 330—253 **10 Claims**

1. A semiconductor integrated circuit including a differential transistor circuit having first and second FETs which each include a drain, a source, and a gate, and whose sources are connected to each other, comprising:



a plurality of first divided drain regions and a plurality of second divided drain regions the same in number, as that of said first divided drain regions, said first and second divided drain regions being arranged alternately, at regular intervals and respectively serving as the drains of said first and second FETs;



a plurality of divided source regions arranged with one source region between each adjacent pair of first and

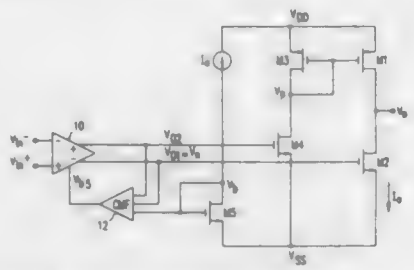
second divided drain regions and serving as the sources of said first and second FETs;

a plurality of first divided gate electrodes, arranged between said first divided drain regions and said divided source regions and serving as the gate of said first FET;

a plurality of second divided gate electrodes, arranged between said second divided drain regions and said divided source regions and serving as the gate of said second FET;

a first drain wiring for connecting said plurality of first divided drain regions to each other; and

a second drain wiring for connecting said plurality of second divided drain regions to each other;



wherein said first and second drain wirings are arranged above the arrangement of said first and second divided drain regions, said divided source regions, and said first and second divided gate electrodes.

5,006,817

RAIL-TO-RAIL CMOS OPERATIONAL AMPLIFIER

Joseph N. Babanezhad, Campbell, Calif., assignor to Sierra Semiconductor, San Jose, Calif.

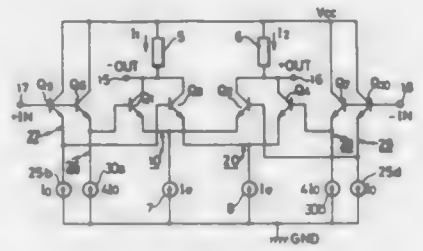
Filed Oct. 13, 1989, Ser. No. 420,937
Int. Cl.[5] H03F 3/45
U.S. Cl. 330—253 **12 Claims**

1. A CMOS operational amplifier comprising:

a source of differential input signals;

a differential-output differential-input folded cascode input stage comprising a differential amplifier coupled to said source for providing a differential-output signal;

a differential input single-ended-output output stage comprising an output biasing coupled to said input stage for determining the common-mode voltage of the differential-output signal of said input stage; and



a common-mode feedback circuit coupled between said input stage and said output biasing section.

5,006,818

LINEAR DIFFERENTIAL AMPLIFIER

Mikio Koyama, Yokohama, and Hiroshi Tanimoto, Kawasaki, both of Japan, assignors to Kabushiki Kaisha Toshiba, Kawasaki, Japan

Continuation-in-part of Ser. No. 253,577, Oct. 5, 1988, abandoned. This application Mar. 27, 1990, Ser. No. 500,044
Claims priority, application Japan, Oct. 12, 1987, 62-254783
Int. Cl.[5] H03F 3/45
U.S. Cl. 330—261 **11 Claims**

1. A linear differential amplifier, comprising:

a pair of first and second transistors with their emitters coupled to each other;

a pair of third and fourth transistors with their emitters coupled to each other, a collector of said first transistor being connected to a collector of said third transistor and a collector of said second transistor being connected to a collector of said fourth transistor;

a pair of input terminals, one of which being coupled to a base of said first transitor, the other one of which being coupled to a base of said fourth transistor;

a pair of output terminals, one of which being connected to said collectors of said first and said third transistor, the other one of which being connected to said collectors of said second and said fourth transistors;

first voltage source means for applying first offset DC voltage between one of said input terminals and a base of said third transistor, said first voltage source means including a first pair of emitter-followers with each said emitter-follower including transistors of same emitter areas but different collector currents, and first emitter current sources for each transistor of said first pair of emitter-followers which supply emitter currents corresponding to the collector currents;

second voltage source means for applying second offset DC voltage of the same magnitude as said first offset DC voltage, between one of said input terminals and a base of said second transistor, said second voltage source means including a second pair of emitter-followers with each said emitter-follower including transistors of same emitter areas but different collector currents, and second emitter current sources for each transistor of said second pair of emitter-followers which supply emitter currents corresponding to the collector currents;

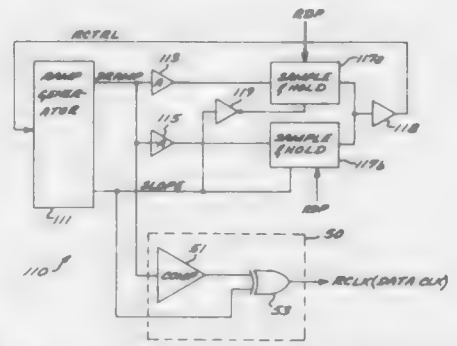
constant current source means for supplying emitter currents to said first, second, third, and fourth transistors; and

load resistor means for converting collector currents of said first, second, third, and fourth transistors into output voltages.

5,006,819

TRACK AND HOLD PHASE LOCKED LOOP CIRCUIT

William A. Buchan, Corona del Mar, and John J. Quintus, Buena Park, both of Calif., assignors to Archive Corporation, Costa Mesa, Calif.



Filed May 21, 1990, Ser. No. 526,490
Int. Cl.[5] H03L 7/091, 7/099
U.S. Cl. 331—1 A **11 Claims**

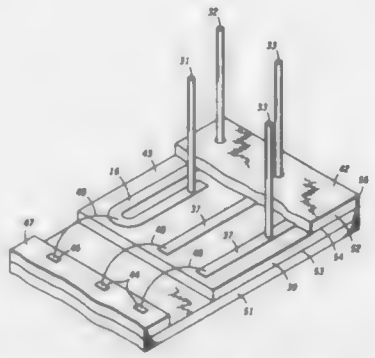
1. A phase locked loop comprising:

ramp signal generating means responsive to a control signal for generating a dual slope ramp signal having alternating

first and second slopes of opposite sign that are controlled by the level of the control signal; and

sampling means responsive to sample control pulses for providing a sampling means output representative of the

amplitude of said dual ramp signal at the time of a sample pulse; and



means responsive to said sampling means output for providing the control signal to said ramp generating means.

5,006,820

LOW REFLECTION INPUT CONFIGURATION FOR INTEGRATED CIRCUIT PACKAGES

Jerry E. Prioste, Scottsdale, and Keith Nelson, Tempe, both of Ariz., assignors to Motorola, Inc., Schaumburg, Ill.

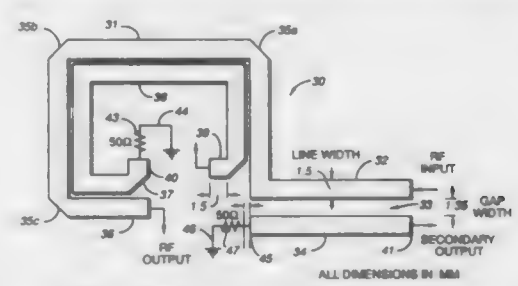
Filed Jul. 3, 1989, Ser. No. 374,791
Int. Cl.[5] H03H 7/38
U.S. Cl. 333—33 **16 Claims**

1. A semiconductor package for electrically coupling to an integrated circuit having a low reflection input configuration comprising: a first external lead; a second external lead; a conductive path coupling the first and second external leads, wherein the conductive path has a substantially constant characteristic impedance and a portion of the conductive path forms a bonding pad; and a conductor coupled between the bonding pad and the integrated circuit disposed in the semiconductor package.

5,006,821

RF COUPLER HAVING NON-OVERLAPPING OFF-SET COUPLING LINES

Ambrose W. C. Tam, Hong Lok Yuen, Hong Kong, assignor to Astec International, Ltd., Hong Kong



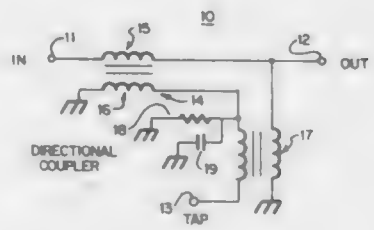
Filed Sep. 14, 1989, Ser. No. 407,343
Int. Cl.[5] H01P 5/18
U.S. Cl. 333—116 **13 Claims**

4. An RF coupler for RF transmission media, such as stripline and microstrip, comprising:

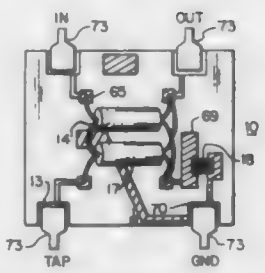
a primary RF coupling element having an elongate input end for receiving an RF signal and extending into a U-shaped portion for defining an RF coupling interface;

a first coupling means for coupling a desired RF signal from said primary RF coupling element, said first coupling means disposed in parallel adjacent relation with said elongate input end; and

a second coupling means congruent with said U-shaped portion of said primary coupling element and maintained



at a minimum distance from said primary element such that a desired RF signal is coupled from said primary element to said second coupling means and wherein said first and second RF coupling means are offset in a non-overlapping relation with respect to one another.



5,006,822

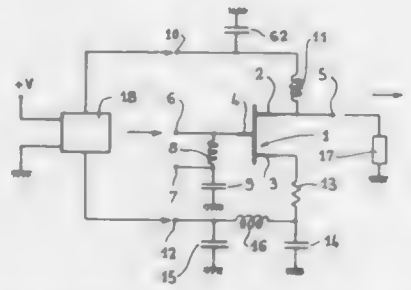
HYBRID RF COUPLING DEVICE WITH INTEGRATED CAPACITORS AND RESISTORS

Prabhakara Reddy, 7 Sheep Meadow Pl., The Woodlands, Tex. 77381

Filed Jan. 3, 1990, Ser. No. 460,355
Int. Cl.[5] H03H 7/48; H05K 1/16
U.S. Cl. 333—112 **10 Claims**

1. A hybrid integrated circuit without discrete capacitors or resistors comprising

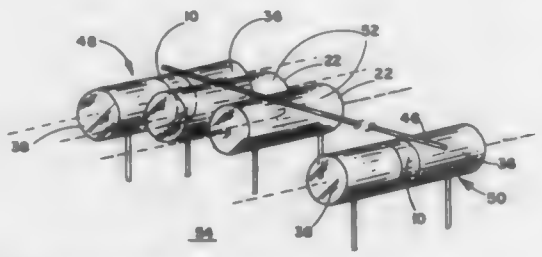
a substrate formed of a refractory dielectric sheet having a front surface and a reverse surface;



printed conductors printed on the front surface of the substrate and having one or more broadened portions formed thereon of predetermined area to serve as capacitor plates;

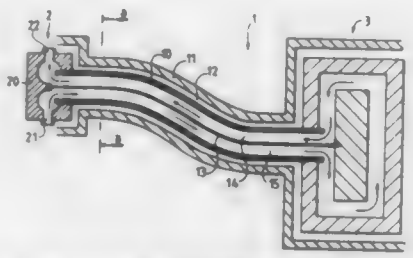
one or more printed resistors formed of a resistive material printed onto said substrate in contact with said printed conductors; and

a conductive ground pad printed in a predetermined pattern onto a portion of the reverse surface of said substrate at selected locations thereon and having one or more broadened portions in registry with the broadened portions of the printed conductor to serve as a grounded capacitor plate and leaving at least one substantially open space on



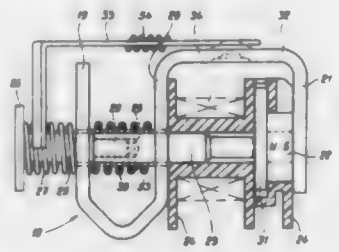
said reverse surface not occupied by said grounded capacitor plate.

5,006,823
MICROWAVE PHASE SHIFTER WITH 0 OR π PHASE SHIFT
Michel-Claude Baril, Lesigny, and Dominique Rimbert, Paris, both of France, assignors to Thomson-CSF, Puteaux, France
Filed Oct. 23, 1989, Ser. No. 425,815
Claims priority, application France, Oct. 28, 1988, 88 14135
Int. Cl.[5] H03H *7/18;* **H03C** *3/00*
U.S. Cl. 333—164 **10 Claims**



1. A microwave phase shifter for generating, in response to a control signal, a phase shift of zero or a phase shift of π comprising at least one field effect transistor having three electrodes, one of which is a gate, and to said gate an input microwave is applied, the output microwave being taken at one of the other two electrodes of said transistor, and low-frequency switching-over means for applying, between said other two electrodes, a dc bias voltage with a predetermined value but with a different polarity according to the phase shift (either zero or π) desired.

5,006,824
THIRD MODE TORSIONAL F-M RESONATOR
Aaron R. Paff, Tustin, Calif., assignor to Rockwell International Corporation, El Segundo, Calif.
Filed Apr. 7, 1986, Ser. No. 849,093
Int. Cl.[5] H03H *9/205*
U.S. Cl. 333—197 **6 Claims**



1. A bandpass filter comprising:
an input resonator formed as a first third-mode torsional electromechanical resonator coupled to receive an electrical input signal;
at least one second-mode torsional interior resonator coupled in spaced relationship to said input resonator; and
an output resonator formed as a second third-mode torsional electromechanical resonator coupled in spaced relationship to said at least one second-mode torsional interior resonator so that said at least one second-mode torsional interior resonator is physically positioned between said input resonator and said output resonator.

COAXIAL LINE COUPLER WITH FLUID COOLED INNER CONDUCTOR
Roland Guilbert, Yerres, and Bernard Dhoat, Orsay, both of France, assignors to Thomson-CF, Paris, France
Filed Oct. 14, 1988, Ser. No. 262,482
Claims priority, application France, Oct. 16, 1987, 87 14297
Int. Cl.[5] H01J *23/48;* **H01P** *3/06*
U.S. Cl. 333—245 **5 Claims**

1. A cooling device for microwave circuits comprising:
a coaxial cable capable of curvature and of finite length defined by a distance between two extremities of said coaxial cable, said coaxial cable capable of conveying very high power microwave energy, said coaxial cable comprised of a central conductor with a hollow interior having predefined dimensions with respect to a longitudinal length, an internal cross-section diameter, an external cross-sectional diameter, and a thickness defined therebetween, and an external conductor within which there is placed the central conductor, the cooling device comprising an inlet channel and a return flow channel, to enable the passage of a cooling fluid, forming within the central conductor such that the channels are separated in the interior of the hollow central conductor by a longitudinal separating strip movably at least partially so as to follow any curvature of said coaxial cable, and located therein, said strip having a width, which is substantially equal to the internal diameter of the central conductor allowing said strip to be inserted by sliding into the hollow central conductor, such that said strip separates the interior of the central conductor longitudinal into two conduits each conduit respectively forming one of said inlet and return flow channels for the circulation of a cooling fluid and such that said partially movable longitudinal strip forms at least part of said cooling channels.

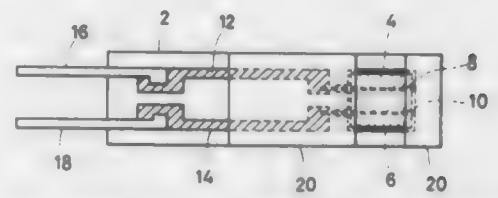
TRIP DEVICE FOR AN ELECTRICAL SWITCH AND AN ELECTRICAL SWITCH WITH THIS TRIP DEVICE
Jozef H. A. Knoben, Hengelo, and Jan B. Wensink, Hengevelde, both of Netherlands, assignors to Holec Systemen en Componenten B.V., Hengelo, Netherlands
Filed Jan. 3, 1990, Ser. No. 460,516
Claims priority, application Netherlands, Jan. 3, 1989, 8900007
Int. Cl.[5] H01H *75/12*
U.S. Cl. 335—35 **22 Claims**

1. A trip device for an electrical switch, comprising:
a yoke of magnetic material;



an elongated armature supported by said yoke, an end section of said armature protruding through said yoke, said armature being movable between a first and second position, said end section protruding further from said yoke with said armature in said second position than in said first position;
spring means attached to said armature for moving it to said second position;
a permanent magnet fixedly arranged such that said magnet, yoke and armature form a first magnetic circuit for holding said armature in said first position under the influence of the magnetic flux by said permanent magnet and against the force of said spring means;
at least one magnet winding for electromagnetically moving said armature to said second position; and
a second magnetic circuit for moving said armature to said second position independently of the polarity of electric current flowing in said at least one magnet winding, and comprising a further yoke of magnetic material containing said end section, the outwardly facing end of said end section merging into a head member having a higher magnetic resistance than said armature, said head member protruding through a face of the further yoke towards the outside such that the outwardly facing end of said end section is located, in said first position, at a distance from said face, said end section being surrounded by said at least one magnet winding.

THERMOSTAT HAVING A MOVABLE BACKSTOP
Stephen J. Brueton, Stouffville, and Adriana V. Serbanescu, Scarborough, both of Canada, assignors to Honeywell, Inc. - Honeywell Limitée, North York, Canada
Filed Apr. 19, 1990, Ser. No. 510,928
Int. Cl.[5] H01H *37/12, 37/52*
U.S. Cl. 337—361 **6 Claims**

1. A thermostat, comprising:
a setting wheel rotatably attached to said frame having an outer edge and a central region, a first ramp formed on said outer edge and a second ramp formed on said central region;
a first lever having first and second ends, said first end of said first lever being attached to said frame, and said second end of said first lever being arranged to contact said first ramp;
a first plunger having first and second ends and a longitudinal axis, said first plunger being movable along said longitudinal axis, said first end of said plunger being in contact with said first lever;
a backstop slidably attached to said frame movable in the axial direction of said first plunger, said backstop being in contact with said second end of said first plunger and being adapted to move when said setting wheel is positioned such that said first ramp contacts and caused said first lever to move which in turn causes said first plunger to move in said axial direction;
a second lever having a first and ends, said first end of said second lever being attached to said frame, said second end of said second lever movable between first and second positions, said second end of said lever further being in contact with said second ramp;
a second plunger having first and second ends in a longitudinal axis, said second plunger being movable along its longitudinal axis between third and fourth positions;
a deformable element interposed between said first end of said second plunger and said second lever, said deformation occuring as a function of temperature;
a movable contact having an elongated shape and first and second ends, said first end of said movable contact being attached to said frame, said second end of said movable contact movable between fifth and sixth positions by said second plunger; and
a fixed contact attached to said frame adapted to be contacted by said movable contact.

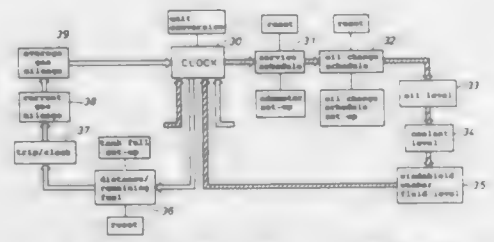
EXHAUST GAS SENSOR AND PROCESS FOR PRODUCING SAME
Yoshida Yutaka; Osaga Kazuo, both of Osaka; Hanada Mariko, Nara, and Komatsu Kazunari, Hiroshima, all of Japan, assignors to Figaro Engineering, Inc. and Mazda Motor Corporation, both of Osaka, Japan
Filed Jul. 6, 1989, Ser. No. 376,044
Claims priority, application Japan, Jul. 14, 1988, 63-175589
Int. Cl.[5] H01C *7/00*
U.S. Cl. 338—34 **4 Claims**



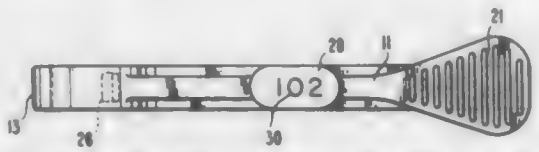
1. An exhaust gas sensor including a perovskite compound $ASnO_3$ where A represents at least one member selected from the group consisting of Ba, Sr, and Ca, and at least a pair of noble metal electrodes contacted to the $ASnO_3$,
the exhaust gas sensor being characterized in that an electrically conductive complex oxide film of $ASnO_3$ and a base metal oxide, whose base metal constituent is different from each metal constituent of $ASnO_3$, is deposited on the surface of the electrodes at the portion thereof in contact with $ASnO_3$.

5,006,829
INFORMATION DISPLAY SYSTEM FOR A VEHICLE
Osamu Miyamoto; Hideki Kanou; Kazuo Nakamura; Takeshi Imai, and Kenichi Nishida, all of Saitama, Japan, assignors to Honda Giken Kogyo K.K., Tokyo, Japan
Filed Mar. 31, 1988, Ser. No. 176,496
Claims priority, application Japan, Mar. 31, 1987, 62-79282; Mar. 31, 1987, 62-79285; Mar. 31, 1987, 62-79290
Int. Cl.[5] G08B *19/00*
U.S. Cl. 340—459 **27 Claims**

1. An information display system for a vehicle, comprising:
a plurality of sensors for detecting various conditions of the vehicle;
a display unit for displaying a selected one of a plurality of items of information relating to the conditions of the vehicle as detected by the corresponding sensors;
manual switch means for sequentially shifting the items of information which is currently displayed on the display unit; and

control unit comprising automatic selection means for producing one of the items of information on the display unit according to output from one of the sensors;

the control unit further comprising automatic shifting means for changing the item of information which is currently displayed to a display of a default item of information,



when the item of information currently displayed was manually selected, upon elapsing of a certain time interval after the manual selection of the current item of information for display wherein, if the manually selected item of information for display is selected when the vehicle is stationary, the time interval begins from the time at which the vehicle is no longer stationary.

METHOD AND DEVICE FOR DETERRING THE UNAUTHORIZED REMOVAL OF A NEWBORN FROM A DEFINED AREA

Rebecca Merritt, 250 E. 700 South, Lebanon, Ind. 46052

Filed Oct. 16, 1989, Ser. No. 421,860
Int. Cl.[5] G08B *23/00*; A44C *5/00*
U.S. Cl. 340—573 **15 Claims**

1. A method for deterring unauthorized removal of newborns from a defined area comprising the steps of:

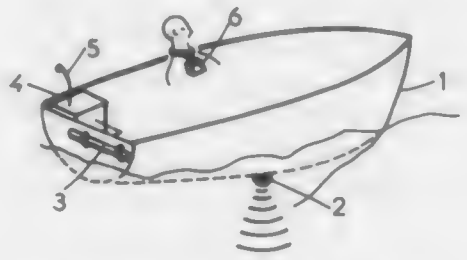
providing an umbilical clamp containing a triggering element and with a distinctive identification mark thereon;

clamping the umbilical cord of a newborn immediately after birth with the provided umbilical clamp;

providing a detection system capable of determining when the triggering element comes within a predefined proximity of an exit from the defined area;

providing an alarm system that is activated when the detection system determines that the triggering element is within the predefined proximity of an exit from the defined area; and

placing the newborn with the attached triggering element within the defined area.



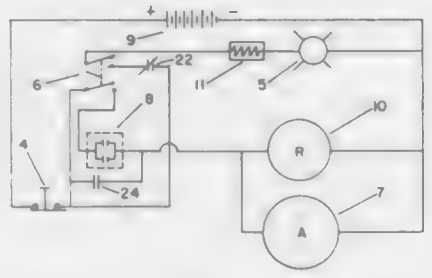
5,006,831

DEVICE PROVIDING FOR THE SAFETY OF A MAN OVERBOARD

Francois de Solminihac, Brest, France, assignor to Thomson-CSF, Puteaux, France

Filed Sep. 19, 1989, Ser. No. 409,309
Claims priority, application France, Sep. 23, 1988, 88 12464
Int. Cl.[5] G08B *13/14*
U.S. Cl. 340—573 **2 Claims**

1. A device for the rescue of a person who has fallen overboard a nautical vehicle, comprising rescue means that are on board the vehicle and are designed to be put in water under the control of a radioelectric signal automatically emitted by an emitter of signals, built into an alarm pack carried by the person when he reaches the water, this signal actuating a means for jettisoning the rescue means, said device wherein the vehicle is fitted out with a submerged acoustical device to emit acoustical signals in the water and wherein the alarm pack further includes an acoustic sensor which is sensitive to the



signals that are propagated in the water from an acoustical device to actuate a radio transmitter for the emission of said radioelectric signal which is then picked up by a receiver installed in said vehicle to trigger the means for jettisoning the rescue means.

5,006,832

POCKET ALARM

Armand J. Beaudry, 11502 - 66 Street, Edmonton, Alberta, Canada (T5J 1H9)

Filed May 10, 1990, Ser. No. 521,550
Int. Cl.[5] G08B *15/00*
U.S. Cl. 340—574 **11 Claims**

1. A portable alarm comprising:

a light circuit having in series a normally closed first relay contact and a light;

an alarm circuit having in series an impact switch and an alarm;

manual switch means in series with each of the light circuit and the alarm circuit for activating the light circuit and setting the alarm circuit to a ready position, the impact switch being operable upon impact to turn the alarm on when the alarm circuit is in the ready position;

an alarm maintenance circuit connected in series with the alarm circuit;

a relay in series with the impact switch, the relay being operable to open the normally closed first relay contact and to activate the alarm maintenance circuit; and

a power source for the light, alarm and alarm maintenance circuits.

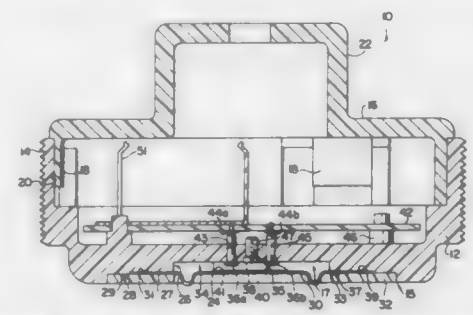
5,006,833

SEWER LINE RESTRICTION ALARM PLACED IN CLEAN OUT PLUG

Edward D. Marlowe, Collinsville, Conn., and Christian P. Marlowe, Nederland, Colo., assignors to CDF, Inc., Collinsville, Conn.

Filed Jul. 25, 1989, Ser. No. 385,587
Int. Cl.[5] G08B *21/00*
U.S. Cl. 340—611 **8 Claims**

8. In combination with the main clean-out plug location in a sanitary sewer line in a residential or commercial building



structure, an early warning sensor and alarm device for indicating the flow conditions of the sewer line, said device comprising:

a generally cylindrically shaped housing including a body portion and a cap portion, said body portion having a face and a recessed portion;

means for coupling said device to the main clean-out plug location;

means for sensing and responding to the presence of a fluid at the device, said sensing and responding means having a normal, at-rest state, said normal state corresponding to a non-restricted flow condition in the sewer line, and an operative state, said operative state corresponding to a restricted flow condition in the sewer line, said fluid presence sensing and responding means further comprising a diaphragm having a shape and size larger than said recessed portion and being hermetically sealed to said body portion to cover said recessed portion to form a variable volume chamber, said diaphragm having one surface facing inwardly into said chamber and another surface forming an integral portion of said face;

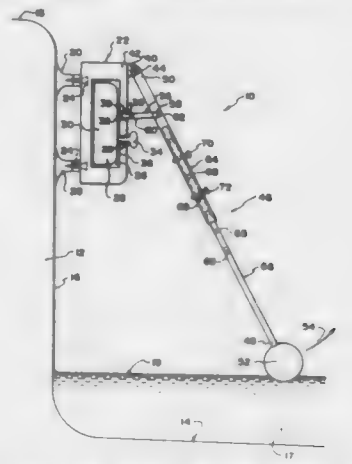
alarm means responsive to said fluid presence sensing and responding means for providing an alarm signal in response to said fluid presence sensing and responding

means being operated to its operative state, said alarm responsive means further comprising switch means extending axially from said body portion into said chamber and forming two terminals and electrical contact means mounted to said one surface of said diaphragm for movement with said one surface of said diaphragm so that motion of said one surface of said diaphragm in response to the presence of fluid upon said another surface of said diaphragm causes said electrical contact means to move into physical contact with said terminals of said switch means thereby providing a continuous electrical path through said switch means, and

means for delaying the response of said sensing and responding means to a fluid presence condition at the device "to mask out" transient flow conditions, said response time delay means further comprising orifice means for providing air communication between said chamber formed by said diaphragm and said recessed portion and an interior cavity formed between said body portion and said cap, said orifice means restricting the air discharge rate from said chamber in response to a reduction in the volume of said chamber in response to axial movement by said diaphragm, said restricting means dampening said diaphragm motion and effecting a response time delay.

5,006,834

LIQUID LEVEL ALARM



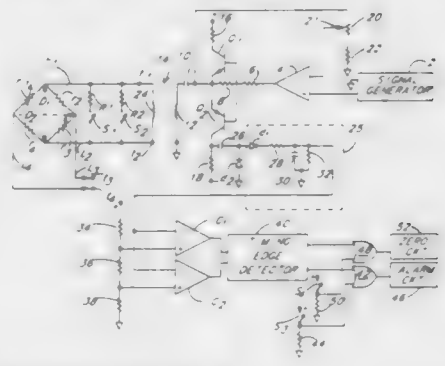
David J. Fountain, Box 480, Burns Lake, British Columbia V0J 1E0, Canada

Filed Mar. 15, 1989, Ser. No. 323,895
Int. Cl.[5] G08B *21/00*
U.S. Cl. 340—625 **22 Claims**

1. An apparatus for providing an alarm signal to indicate when liquid reaches a pre-determined level in a container, the apparatus comprising:

(a) means for pre-determining the level of the liquid at which the alarm signal will actuate;

(b) a mechanically pre-set non-electrical alarm unit having a mechanical alarm and a push-pull alarm actuator connected to said pre-determining means; and



(c) a float means for resting on the surface of the liquid connected to said alarm unit and said pre-determining means and movable with respect to the predetermined level of the liquid for moving said actuator in a substantially axial direction to activate said mechanical alarm when the surface of the liquid reaches the pre-determined level of the liquid.

REMOTE CALIBRATING FOR PRESSURE TRANSDUCER

Allen B. Griswold, North Falmouth; Paul A. Tessier, Hudson, and Drew G. Koschek, Ashland, all of Mass., assignors to Hewlett-Packard Company, Palo Alto, Calif.

Continuation of Ser. No. 83,749, Aug. 7, 1987, abandoned. This application Aug. 14, 1990, Ser. No. 568,653
Int. Cl.[5] G08B *21/00*
U.S. Cl. 340—626 **6 Claims**

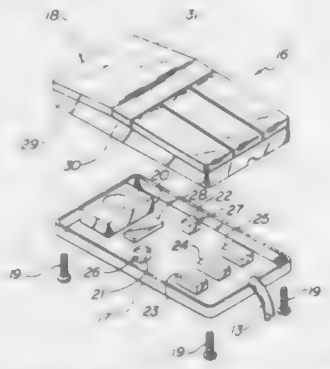
1. A pressure monitor having

a first pair of terminals,

means for applying an excitation voltage for a transducer between said first pair of terminals,

a second pair of terminals adapted for receiving a signal representing pressure from said transducer,

means responsive to a signal between said second pair of terminals for indicating the pressure represented by the signal, and



means within said monitor directly responsive to an arbitrary change in current through said first pair of terminals for calibrating said means for indicating pressure so that it indicates a pressure of zero when a zero pressure is applied to said transducer.

5,006,836

SQUEEZABLE COMPUTER CONTROL DEVICE

James L. Cooper, Tyngsboro, Mass., assignor to Wang Laboratories, Inc., Lowell, Mass.

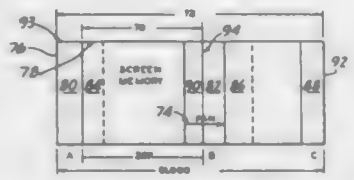
Filed Jun. 14, 1988, Ser. No. 206,549
Int. Cl.[5] G09G 5/08
U.S. Cl. 340—710 5 Claims

1. A control mouse for providing control signals to a computer comprising a motion transducer affixed in said mouse in a position to engage an engagement surface against which said mouse is positioned, said transducer generating a motion signal indicative of the motion of said mouse relative to said engagement surface, and a communications channel connected to communicate said motion signal to a computer,

said mouse having two opposed outward facing digit-engaging portions,

said mouse being sized and shaped to be grasped by squeezing force applied by one hand of an operator with a digit engaging each of said digit-engaging portions to effect movement relative to said surface,

said mouse including pressure operated switch means installed so as to be switched to a first state by squeezing force below a predetermined threshold force applied between two digits positioned respectively at said opposed digit-engaging portions and switched to a second state by squeezing force above said threshold force applied between two digits positioned respectively at said opposed digit engaging portions,



said mouse including means connected to said switch means for communicating a signal discriminating the states of said switch means to said computer.

5,006,837

PROGRAMMABLE VIDEO GRAPHIC CONTROLLER FOR SMOOTH PANNING

John J. Bowers, 4509 Coddingville Rd., Medina, Ohio 44256

Filed Jan. 26, 1989, Ser. No. 303,280
Int. Cl.[5] G09G 5/38
U.S. Cl. 340—724 15 Claims

1. A method of operating a display system for displaying data from a video memory to allow panning through virtual video memory which is larger than the video memory of the display system comprising the steps of:

(1) defining the logical screen width within video memory to be a predetermined width which is larger than screen memory,

(2) setting a start address of said screen memory at a predetermined position relative to an edge of said video memory,

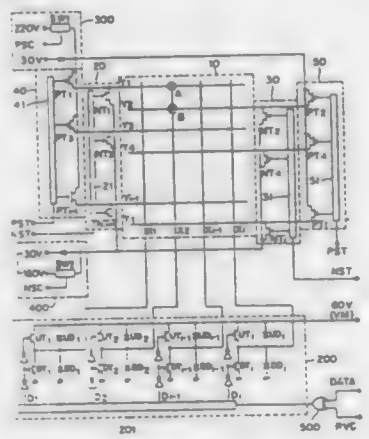
(3) storing in said video memory initial first and second identical strips of graphic image data being positioned at predetermined locations within said video memory,

(4) incrementing a panning register so as to move said screen memory through a predetermined number of pixels within said video memory,

(5) storing in said video memory a further first strip of graphic image data being positioned at a predetermined location in said video memory relative to said initial first strip of graphic image data, and a further second strip of graphic image data identical to said further first strip and being positioned at a predetermined position relative to said initial second strip of graphic image data in video memory,

(6) repeating steps 4 and 5 with said further first and second strips being positioned at predetermined positions relative to one another respectively until said video memory has been filled with graphic image data ad shifting of said screen memory to an edge of said video memory is completed,

(7) resetting said start address of said screen memory a predetermined length from said edge of said video memory,



(8) repeating steps 3–7 so as to continuously pan graphic image data through virtual video memory which is larger than video memory without having to stop and refresh said graphic image data when an edge of said video memory is reached.

5,006,838

THIN FILM EL DISPLAY PANEL DRIVE CIRCUIT

Yoshide Fujioka; Toshihiro Ohba; Yoshiharu Kanatani, all of Nara, and Hisashi Uede, Wakayama, all of Japan, assignors to Sharp Kabushiki Kaisha, Osaka, Japan

Continuation of Ser. No. 864,509, May 19, 1986, abandoned.
This application Jun. 26, 1989, Ser. No. 372,135
Claims priority, application Japan, Jun. 10, 1985, 60-125384
Int. Cl.[5] G09G 3/30
U.S. Cl. 340—781 13 Claims

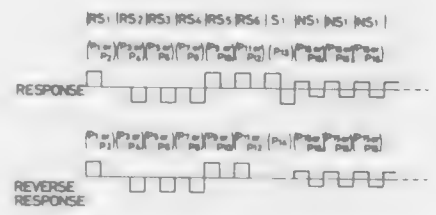
1. A drive circuit for a thin film electroluminescent (EL) display panel having a plurality of scanning electrodes extending in one direction, a plurality of data electrodes extending in a second direction orthogonal to said first direction, and an EL layer sandwiched therebetween, picture elements being defined by intersections of said scanning and data electrodes, said picture elements being controllably selected to cause luminescence thereof, the circuit comprising:

first switching circuit means connected to each of said scanning electrodes for applying a scanning voltage of negative polarity thereto;

second switching circuit means connected to each of said scanning electrodes for applying a scanning voltage of positive polarity thereto;

data electrode driver means connected to said data electrodes for selectively applying a modulation voltage or ground voltage to each said data electrode;

said scanning electrodes being grouped into odd numbered scanning electrodes and even numbered scanning electrodes and being scanned in two fields in which odd numbered scanning electrodes are provided with said negative polarity voltage and even numbered scanning electrodes are provided with said positive polarity voltage in a first field, said negative and positive polarity voltage being applied to said even and odd numbered scanning electrodes, respectively, in a second field;



said data electrode driver means including means for applying said modulation voltage to data electrodes defining selected picture elements along intersecting selected odd numbered scanning electrodes in said first field, applying ground to data electrodes defining selected picture elements along intersecting selected even numbered scanning electrodes in said first field, applying ground to data electrodes defining selected picture elements along intersecting selected odd numbered scanning electrodes in said second field, applying said modulation voltage to data electrodes defining selected picture elements along intersecting selected even numbered scanning electrodes in said second field, and applying voltage levels to data electrodes defining non-selected picture elements along intersecting selected scanning electrodes in each field of a different voltage to that applied to data electrodes defining selected picture elements intersecting selected scanning electrodes to inhibit selection of said non-selected picture elements.

5,006,839

METHOD FOR DRIVING A LIQUID CRYSTAL OPTICAL APPARATUS

Masanori Fujita, Tokyo, Japan, assignor to Seikosha Co., Ltd., Japan

Filed Jul. 7, 1988, Ser. No. 216,388
Claims priority, application Japan, Jul. 14, 1987, 62-175134
Int. Cl.[5] G09G 3/36
U.S. Cl. 340—784 9 Claims

1. A method for driving a liquid crystal optical apparatus having a matrix of pixels formed by ferroelectric liquid crystal interposed between a scanning electrode group and a control electrode group, comprising:

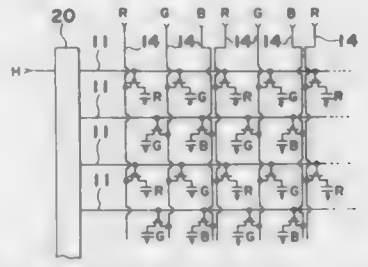
sequentially applying signals to the scanning electrode group and the control electrode group wherein the voltage difference therebetween sequentially forms a first pulse group, a partial response pulse, a second pulse group and a third pulse group applied to the pixels,

wherein the first pulse group initializes the ferroelectric liquid crystal to a saturated reverse response condition,

wherein said partial response pulse holds the ferroelectric liquid crystal to the saturated reverse response condition and prepares the ferroelectric liquid crystal to turn to a desired response condition,

wherein the second pulse group turns the ferroelectric liquid crystal to the desired response condition in cooperation with said partial response pulse, said desired response condition including one of the saturated response condition, the saturated reverse response condition and an intermediate condition,

wherein the third pulse group holds the desired response condition, and



wherein the mean voltage level applied to the ferroelectric liquid crystal is O.

5,006,840

COLOR LIQUID-CRYSTAL DISPLAY APPARATUS WITH RECTILINEAR ARRANGEMENT

Hiroshi Hamada; Toshiaki Takamatsu, both of Yamatokoriyama, and Naofumi Kimura, Nara, all of Japan, assignors to Sharp Kabushiki Kaisha, Osaka, Japan

Continuation of Ser. No. 722,619, Apr. 12, 1985, abandoned.
This application Nov. 27, 1989, Ser. No. 442,391
Claims priority, application Japan, Apr. 13, 1984, 59-75302
Int. Cl.[5] G09G 3/36
U.S. Cl. 340—784 4 Claims

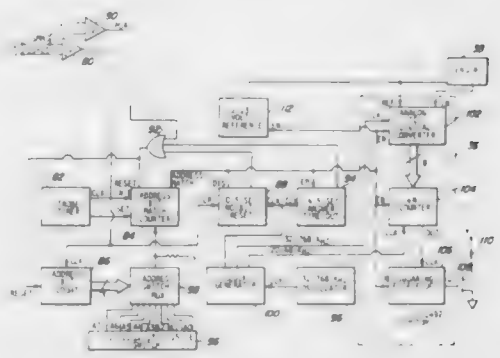
1. A color liquid crystal display apparatus, comprising:

a plurality of picture element groups arranged in a matrix, each picture element group including,

a plurality of color picture elements each associated with a color corresponding to red, green, or blue;

a plurality of scanning electrodes linearly arranged in parallel rows and disposed over said matrix in a first direction; and

a plurality of signal electrodes linearly arranged in parallel columns and disposed over said matrix in a second direction perpendicular to said first direction,



said picture elements groups being disposed over said scanning electrodes and said signal electrodes such that said color picture elements of each color are linearly arranged at a one pixel element pitch in each row in said first direction and in each column in said second direction and only color picture elements of the same color are connected to each said signal electrode to alleviate the need for a color switching circuit.

5,006,841

ADDRESSABLE TRANSDUCER WITH IMPROVED RESPONSE SIGNAL PROCESSING

Arthur D. Vines; Frederick A. Schonfeld, and Ricardo Espat, all of Albuquerque, N. Mex., assignors to Sparton Corporation, Jackson, Mich.

Filed Feb. 16, 1988, Ser. No. 156,487
Int. Cl.[5] H04Q 9/00
U.S. Cl. 340—825.07 4 Claims

1. In an addressable transducer, a response circuit for generating a signal corresponding to a measurand, comprising:

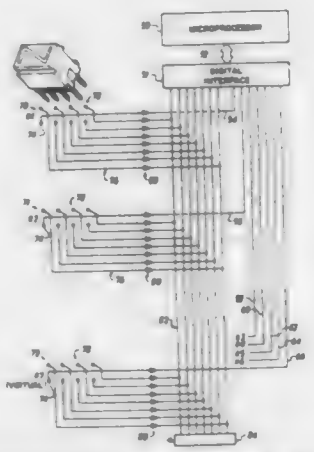
sensing means for producing an analog voltage representing the measurand,

an analog to digital converter responsive to the analog voltage for generating a digital number having a value representing the measurand

clock means for providing a fixed frequency, and

a divider coupled with the clock means and responsive to the digital number for dividing the fixed frequency by the number to yield a resultant frequency corresponding to the value of the measurand.

5,006,842



IDENTITY INSERT BLOCK FOR ELECTRONIC MODULES

Nathan H. Tobol, Wrentham, Mass., assignor to The Foxboro Company, Foxboro, Mass.

Continuation of Ser. No. 37,756, Apr. 13, 1987, abandoned. This application Jun. 8, 1989, Ser. No. 363,664

Int. Cl.[5] H03K *17/94*

U.S. Cl. 340—825.34 **31 Claims**

1. A fixed connection identifier article for use with an electrical connection point having signal input and output channels, comprising:

(a) a body having a plurality of surfaces forming top, bottom, and side faces, including a first surface having thereon at least one visible identifying symbol, a second surface having a plurality of electrical connection pins, and substantially parallel third and fourth surfaces, said third and said fourth surfaces each being characterized by at least one corresponding interlock surface area;

(b) means for forming said input channel for receiving an electrical input signal, comprising at least one but less than all of said connection pins;

(c) said output channel comprising the remainder of said connection pins; and

(d) preselected, hard-wired electrical connections between the electrical input channel and at least one of the output channel connection pins.

SECURITY MODULE TO PRECLUDE UNAUTHORIZED USERS TO OPERATE MOTOR DRIVEN EQUIPMENT AND TO PROTECT VALUABLE PARTS OF THE MOTOR FROM UNAUTHORIZED EXCHANGE

Werner Haser, 40 Fieldcrest Rd., Parsippany, N.J. 07054-2411

Continuation of Ser. No. 278,575, Dec. 1, 1988, abandoned. This application May 2, 1990, Ser. No. 517,430

Int. Cl.[5] B60R *25/00*; **H04Q** *9/00*

U.S. Cl. 340—825.31 **8 Claims**

1. A security system for a motor vehicle having a dashboard and an engine compartment containing a motor and one or more vital motor accessories comprising:

a source of vehicle electrical power;

a keyboard for generating data words;

a code sender in the dashboard coupled to the keyboard including means for outpulsing the generated data words from the keyboard;

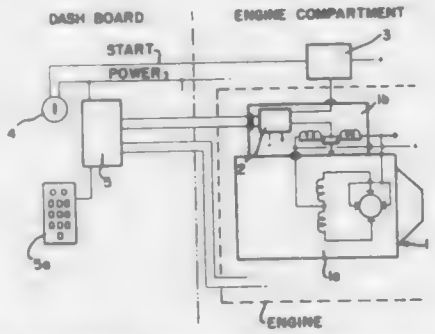
at least one security module implanted within one of the vital motor accessories comprising;

means for permanently storing a distinct data word; and

means responsive to the received data word matching the distinct data word for generating the first signal; and

means coupled between the code sender and each security module for transmitting data words between the code sender and each security module including means for sending the generated data words to the at least one security module;

the at least one security module comprising;



means coupled to the transmitting means for receiving the data words outpulsed from the code sender;

a code memory for storing a predetermined data word;

means coupled to the code memory and to the means for receiving the data words outpulsed from the code sender responsive to the predetermined word in the security module code memory matching one of the data words outpulsed from the code sender for generating a first signal; and

means responsive solely to the first signal for enabling the one vital motor accessory to function only when the data word received from the code sender matches the predetermined data word stored in the code memory implanted within the vital motor accessory the keyboard further comprises;

means for forming a first or second status selecting signal, and

means for coupling the first or second status selecting signal to the code sender;

the code sender further comprises;

a processor coupled to the keyboard, the outpulsing means, and the source of vehicle electrical power; and

a non-volatile memory coupled to the processor for retaining a status code;

the processor comprising;

means responsive to the first status selecting signal from the keyboard for storing a disarmed mode status code in the status code retaining memory,

means responsive to the status code in the status code retaining memory being the disarmed mode status code for generating the distinct data word, and

means for coupling the distinct data word from the processor to the outpulsing means whereby the distinct data word is outpulsed to the security modules when the vehicle electrical power is turned on;

means responsive to the second status selecting signal from the keyboard for storing an armed mode status code in the status code retaining memory;

means responsive to the status code in the status code retaining memory being the armed mode status code for generating a data word request signal when vehicle electrical power is turned on to indicate inserting of a data word; and

means responsive to the data word request signal for coupling the keyboard to the outpulsing means whereby a data word from the keyboard is sent to the outpulsing means.

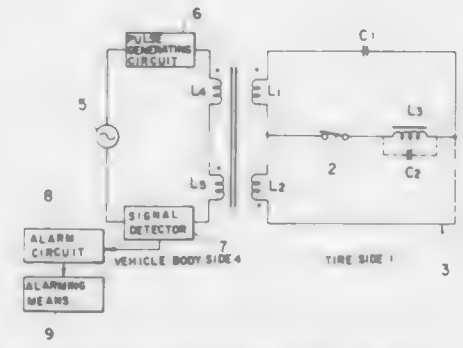
TIRE ABNORMALITY DETECTING DEVICE



Katsuhiro Ohta; Hisami Masuda, and Mamoru Makishima, all of Tokyo, Japan, assignors to TDK Corporation, Tokyo, Japan

Filed Jan. 29, 1989, Ser. No. 373,846

Claims priority, application Japan, Jul. 4, 1988, 63-89200[U]

Int. Cl.[5] B60C *23/02*

U.S. Cl. 340—448 **4 Claims**

1. A tire abnormality detecting device comprising:

a first unit to be provided on a vehicle body side, said first unit including

an electrical signal generating source for generating a specific electrical signal,

a first coil device, serially connected to said electrical signal generating source, for generating an induction voltage in receipt of said electrical signal, and

detecting means, serially connected to first coil device, for detecting a change in said induction voltage of said first coil device; and

a second unit provided on a tire side, said second unit including

a second coil device to be magnetically connected to said first coil device, said second coil device having first and second coils and a capacitor respectively connected in series,

a switch mechanism, connected between a junction of said first and second coils, opening and closing in response to a change in air pressure in a tire, and

a third coil device, connected in series between said switch mechanism and said capacitor, said second and third coil devices forming a resonance circuit, said third coil device having a temperature detecting magnetic core,

wherein said detecting means detects said change in said induction voltage of said first coil device generated by said second coil device according to one of (a) an open/-close condition of said switch mechanism and (b) magnetic permeability of said third coil device.

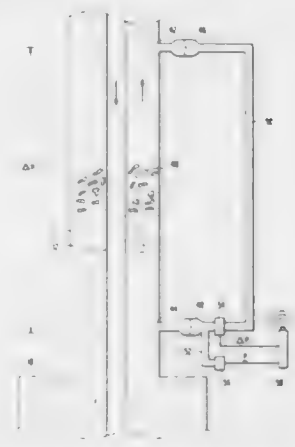
GAS KICK DETECTOR

Henry V. Calcar, Edmonds, Wash., and Gary L. Marsh, New Orleans, La., assignors to Honeywell Inc., Minneapolis, Minn. and Shell Offshore Inc., New Orleans, La.

Filed Jan. 13, 1989, Ser. No. 366,093



Int. Cl.[5] G01V *1/00*

U.S. Cl. 340—853 **17 Claims**

1. A method for detecting a gas kick during drilling, comprising the steps of:

determining a first average density of drilling mud in a marine riser, said marine riser being comprised of a plurality of riser sections extending from an ocean floor to a sea surface;

determining a second average density of drilling mud in an instrumented riser section of said marine riser, said instrumented riser section being positioned near said ocean floor in said marine riser; and

comparing said first average density with said second average density whereby a rapid change in a ratio of said first average density to said second average density is indicative of a gas kick.

POWER TRANSMISSION LINE MONITORING SYSTEM

J. Michael Granville, 9701 Wilshire Blvd., #850, Beverly Hills, Calif. 90212; Robert E. Costa, 8435 Sale Ave., and Sam Y. Chu, 23684 Justice St., both of Canoga Park, Calif. 91304

Continuation of Ser. No. 119,750, Nov. 12, 1987, abandoned. This application Jan. 12, 1990, Ser. No. 464,707

Int. Cl.[5] H04B *9/00*

U.S. Cl. 340—870.28 **21 Claims**

1. A power transmission line monitoring system comprising;

current sampling means for sampling current on a transmission line;

rectifying means for rectifying the output of said current sampling means;

power supply means connected to the output of said rectifying means for producing power;

line current sensing means connected to said rectifying means for sensing line current;

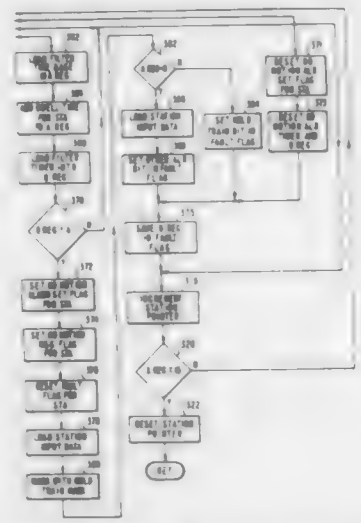
line temperature sensing means for sensing the temperature of said transmission line;

line voltage sensing means connected to said transmission line, said line voltage sensing means including a voltage divider comprised of a small resistance connected to said transmission line in series with a very large resistance connected to earth ground;

signal processing means receiving and processing the outputs of said line current sensing means, said line tempera-

ture sensing means and said line voltage sensing means; said signal processing means including data transmission means for transmitting current, temperature and voltage data to a receiving and data processing station located remotely from said power transmission line for recording and analysis;

said data transmitting means comprising a cable that includes said very large resistance of said voltage divider; and



a common system return connecting said line current sensing means, said line temperature sensing means, said line voltage sensing means, said power supply and said signal processing means to said transmission line whereby system circuits are isolated from earth ground by using the power transmission line as a reference.

5,006,847

TRAIN MOTION DETECTION APPARATUS

Donald L. Rush, Penn Hills Township, Allegheny County, and Norman W. May, Pittsburgh, both of Pa., assignors to AEG Westinghouse Transportation Systems, Inc., Pittsburgh, Pa.

Continuation of Ser. No. 672,039, Nov. 16, 1984, abandoned.
This application Apr. 5, 1988, Ser. No. 180,702
Int. Cl.[5] G08G *1/12, 1/07*
U.S. Cl. 340—994 3 Claims

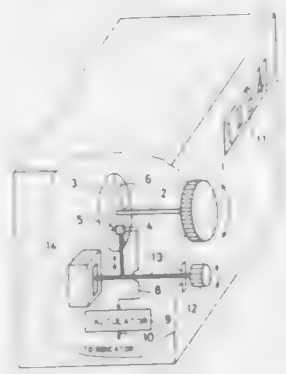
1. A monitoring system for detecting when any of one or more trains operating in a transit system is not moving along the system track as desired, the system track being divided into successive track signal blocks each having means for generating a signal indicating whether a train is occupying any portion of the signal block, said monitoring system comprising:

computer means for storing the respective occupancy signals for the track blocks;

said computer means periodically comparing new and past occupancy signal values for the track blocks to indicate occupancy changes;

means for resetting an alarm timer for each block occupancy change;

means for enabling each running timer to continue operation if no occupancy change has occurred in the block to which the timer corresponds; and



means for generating a system operator alarm when any running timer reaches a present time limit to indicate a no-motion train condition requiring system level supervisory action.

5,006,848

ROTARY ENCODER CAPABLE OF GENERATING ELECTRONIC PULSES HAVING VARIABLE FREQUENCY WITHOUT CHANGING ROTARY PLATE

Toshiyuki Fukumiza, Itami, Japan, assignor to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

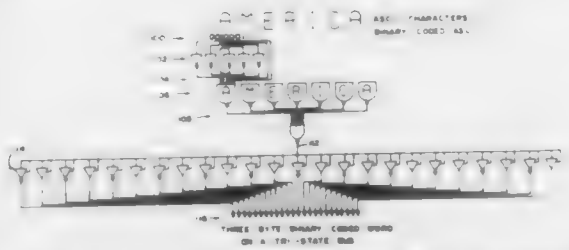
Filed Jun. 6, 1989, Ser. No. 362,110
Claims priority, application Japan, Feb. 8, 1989, 1-28890
Int. Cl.[5] H03M *1/22*
U.S. Cl. 341—13 5 Claims

1. A rotary encoder comprising:

a rotary plate having a plane on which a plurality of elements to be detected are provided in a predetermined arrangement in such a manner that said elements to be detected are different in number along inner and outer concentric circles arranged with respect to a rotation center of the rotary plate;

supporting means for rotatably supporting said rotary plate;

detecting means arranged opposite to said plane of said rotary plate for detecting said elements to be detected in response to rotation of said rotary plate to generate electric pulses, said detecting means detecting said elements to be detected on a desired concentric circle with respect to the rotation center of the rotary plate; and



moving means for moving said detecting means along said plane of said rotary plate.

5,006,849

APPARATUS AND METHOD FOR EFFECTING DATA COMPRESSION

David W. Baarman, Zeeland, Mich., and David M. Richards, Littleton, Colo., assignors to Astro, Inc., Grand Rapids, Mich.

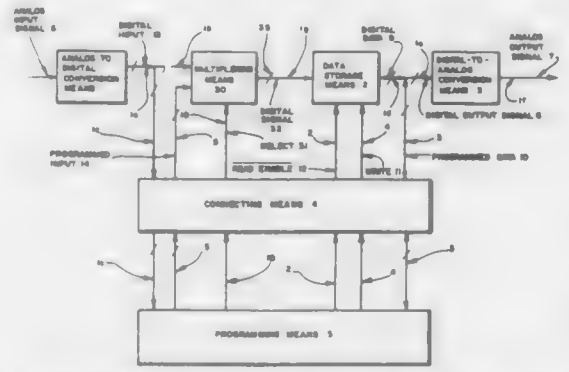
Filed Jul. 26, 1989, Ser. No. 385,859
Int. Cl.[5] H03M *7/30*
U.S. Cl. 341—95 26 Claims

1. A method of compressing input data into compressed data, the input data being coded character by character, said method comprising:

providing a word dictionary of recognizable character strings and a word code for each such string;

providing a phrase dictionary of recognizable word code strings and a phrase code for each such string;

comparing the input data with the word dictionary and substituting for each recognizable character string the word code associated with such string; and



comparing the input data as modified by said first comparing step with the phrase dictionary and substituting for each recognizable string of word codes the phrase code associated with such string.

FUNCTION TRANSFORMER

Gordon J. Murphy, 638 Garden Ct., Glenview, Ill. 60025

Filed Apr. 18, 1988, Ser. No. 182,380
Int. Cl.[5] H03M *1/00*
U.S. Cl. 341—110 19 Claims

1. Apparatus for transforming an analog input signal into an analog output signal that approximates the value of a predetermined mathematical function of said analog input signal comprising:

(a) analog-to-digital conversion means having an input connected to receive the analog input signal and an output for providing an approximation to said analog input signal in the form of a digital code;

(b) data storage means having stored therein a plurality of precalculated digital values of the predetermined mathematical function of said analog input signal to said analog-to-digital conversion means, said data storage means having an input on address lines connected to receive as a digital input signal at least a portion of said digital signal provided at said output of said analog-to-digital conversion means and an output on data lines, for providing at the output thereof an output signal that is at least a portion of an appropriate one of the stored precalculated digital values in response to the input of said digital input signal, and

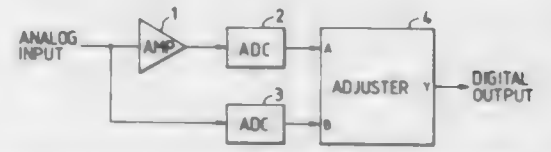
(c) digital-to-analog conversion means having an input connected to receive as a digital input signal at least a portion of said digital signal provided at said output of said data storage means and an output, for providing at the output thereof an analog output signal that corresponds to said digital input signal thereto.

5,006,851

ANALOG-TO-DIGITAL CONVERTING SYSTEM

Tetsuhiko Kaneaki, Ashiya; Mikio Oda, Kyoto; Kozo Nuriya, and Yasunori Tani, both of Osaka, all of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Osaka, Japan

Filed Jul. 17, 1989, Ser. No. 380,355
Claims priority, application Japan, Jul. 18, 1988, 63-178625; Feb. 8, 1989, 1-29079; Feb. 9, 1989, 1-30534; Mar. 13, 1989, 1-59902
Int. Cl.[5] H03M *1/12*
U.S. Cl. 341—155 15 Claims



1. An analog-to-digital converting system comprising:

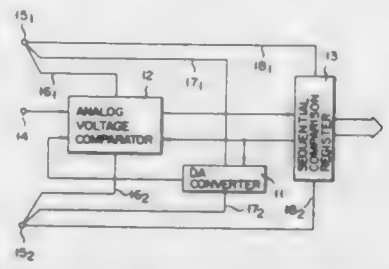
means for converting a first analog input signal into a plurality of second analog signals having different levels respectively;

a plurality of analog-to-digital converters;

means for applying the second analog signals to the inputs of respective converters;

means for adjusting values of output signals from the respective converters as a function of magnitudes of the values of the output signals from the respective converters to convert the output signals from the respective converters into respective adjusted signals;

means for selecting one of the adjusted signals in response to whether or not the values of the output signals from the respective converters are in a predetermined range; and,



means for providing the selected signal as a system output signal.

5,006,852

ANALOG-TO-DIGITAL CONVERTER WITH ISOLATED POWER SUPPLY LINES TO THE INDIVIDUAL COMPONENTS

Junkei Goto, Kawasaki, and Tetsuya Iida, Yokohama, both of Japan, assignors to Kabushiki Kaisha Toshiba, Kawasaki, Japan

Filed May 23, 1989, Ser. No. 355,609
Claims priority, application Japan, May 25, 1988, 63-127414
Int. Cl.[5] H03M *1/00*
U.S. Cl. 341—155 15 Claims

1. An analog-to-digital converter, comprising:

first and second current supply terminal means for providing a power source current to said analog-to-digital converter;

input terminal means for providing an analog voltage input;

digital-to-analog converter means for providing a reference signal;

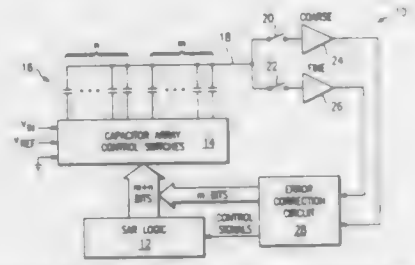
comparator means coupled to the input terminal means and to the digital-to-analog converter means for comparing the analog voltage input with the reference signal to generate a digital comparison signal;

control means coupled to the comparator means and to the digital-to-analog converter means, including means for providing a digital output signal in response to the digital comparison signal, and including means for providing a digital control signal to the comparator means and the digital-to-analog converter means;

a first current supply path coupled between the comparator means and the first and second current supply terminal means, for providing a power source current to the comparator means;

a second current supply path coupled between the digital-to-analog means and the first and second current supply terminal means, for providing a power source current to the digital-to-analog converter means; and

a third current supply path coupled between the control means and the first and second current supply terminal means, for providing a power source current to the control means;



wherein said first, second, and third current supply paths are electrically isolated from one another except at the first and second current supply terminal means.

5,006,853

HYSTERESIS INSENSITIVE ANALOG TO DIGITAL CONVERTER SYSTEM USING A COARSE COMPARATOR AND A FINE COMPARATOR

Sami Kiriaki, Garland, and Khen-Sang Tan, Plano, both of Tex., assignors to Texas Instruments Incorporated, Dallas, Tex.

Filed Feb. 12, 1990, Ser. No. 478,596
Int. Cl.[5] H03M *1/12*
U.S. Cl. 341—156 12 Claims

1. A circuit for converting an analog signal into a digital value comprising

a plurality of bits, the circuit comprising:

a capacitor array comprising a capacitor corresponding to each bit in the digital value;

a top plate coupling together a first node of each capacitor in said array;

capacitor control switching means operable to selectively couple a second node of said capacitors to a reference signal and said analog signal;

a coarse comparator circuit having an input and an output and operable to generate a predetermined number of most significant bits of the plurality of bits representing said digital value;

a fine comparator circuit having an input and an output and operable to generate the remaining bits of said plurality of bits representing said digital value such that the generation of the least significant bits of the digital value will not be affected by hystersis effects of large voltages at the inputs to said comparator circuit;

a course switch operable to selectively couple said top plate to said input or said course comparator circuit; and

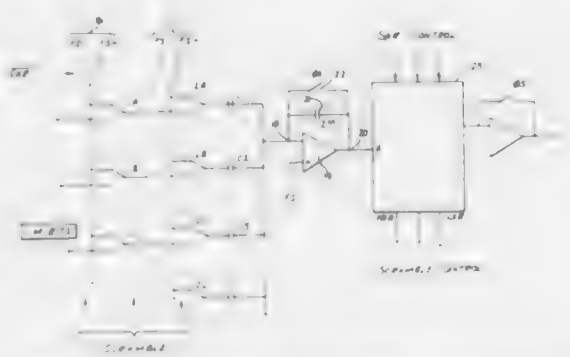
a fine switch operable to selectively couple said top plate to said input of said fine comparator circuit.

5,006,854

METHOD AND APPARATUS FOR CONVERTING A/D NONLINEARITIES TO RANDOM NOISE

Bert White, Irvine, and Mehrdad Negabahn-Hagh, both of Irvine, Calif., assignors to Silicon Systems, Inc., Tustin, Calif.

Filed Feb. 13, 1989, Ser. No. 311,237
Int. Cl.[5] H03M *1/38*
U.S. Cl. 341—172 34 Claims



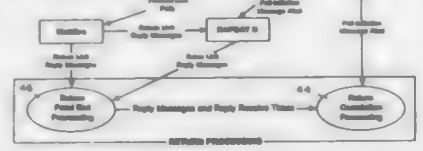
1. A circuit comprising:

a plurality of capacitors, each having a capacitance of approximately C;

a first switch coupled to a first number x of said capacitors;

a second switch coupled to a second number y of said capacitors;

a switching matrix coupled to said plurality of capacitors and to said first and second switches for selectably coupling said plurality of capacitors to each of said first and second switches such that the time-averaged ratio of the amount of time one of said capacitors is coupled to said first switch compared to the amount of time said one of



said capacitors is coupled to said second switch is approximately equal to x/y.

5,006,855

RANGING AND PROCESSING SYSTEM FOR MOBILE SURVEILLANCE AND DATA LINK

Ronald Braff, Annandale, Va., assignor to The Mitre Corporation, Bedford, Mass.

Continuation of Ser. No. 898,196, Aug. 20, 1986, abandoned.
This application Nov. 17, 1988, Ser. No. 274,643
Int. Cl.[5] H04B *7/185*
U.S. Cl. 342—357 7 Claims

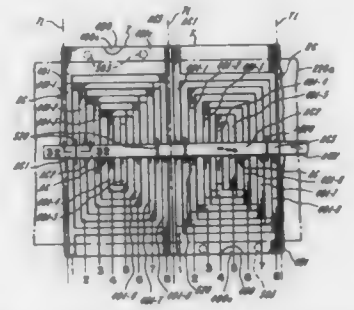
1. A ranging and processing satellite system for data link with and cooperative surveillance of a plurality of mobile units from multiple control facilities comprising:

at least two satellites including means for discretely polling individual mobile units requested by one or more of the control facilities and for receiving replies from the polled mobile units, such replies including information about the mobile units' positions;

means operable in connection with the means for polling and for receiving replies, for precluding garbling between replies to polls initiated by the at least two satellites;

a cross-link communication path between the at least two satellites to exchange mobile ranging data;

processing means on at least one of the satellites to store poll commands, initiate polls according to an optimal sequence that fills in the guard times between polls with other messages, store messages between mobile units and control facilities, and to compute the ranges between the mobile unit and each of the satellites from the replies from the mobile units; and



means for transmitting the computed ranges to at least one of the control facilities.

5,006,856

ELECTRONIC ARTICLE SURVEILLANCE TAG AND METHOD OF DEACTIVATING TAGS

S. Eugene Benge, Middletown, and Robert L. Froning, Kettering, both of Ohio, assignors to Monarch Marking Systems, Inc., Dayton, Ohio

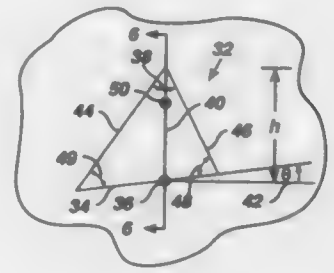
Filed Aug. 23, 1989, Ser. No. 397,804
The portion of the term of this patent subsequent to Oct. 18, 2005, has been disclaimed.
Int. Cl.[5] G08B *13/14*
U.S. Cl. 340—572 18 Claims

1. Method of promoting the permanent deactivation of tags useable in an electronic article surveillance system, comprising the steps of: providing a resonant circuit detectable at a first energy level, the resonant circuit including a spiral conductor having a plurality of conductor portions, positioning a deactivator across and adjacent at least some of the conductor portions, the deactivator including a deactivating conductor and a normally non-conductive breakdown coating with the deactivator being normally responsive to energy applied to the resonant circuit at a second energy level higher than the first energy level for electrically connecting at least two conductor portions to the deactivating conductor, but inhibiting deactivation of the resonant circuit until energy at a third energy level higher than the second energy level is applied to the resonant circuit.

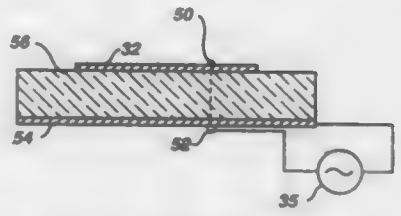
5,006,857

ASYMMETRICAL TRIANGULAR PATCH ANTENNA ELEMENT

Mark J. DeHart, Renton, Wash., assignor to The Boeing Company, Seattle, Wash.



Filed Aug. 9, 1989, Ser. No. 391,478
Int. Cl.[5] H01Q *1/38*
U.S. Cl. 343—700 MS 19 Claims



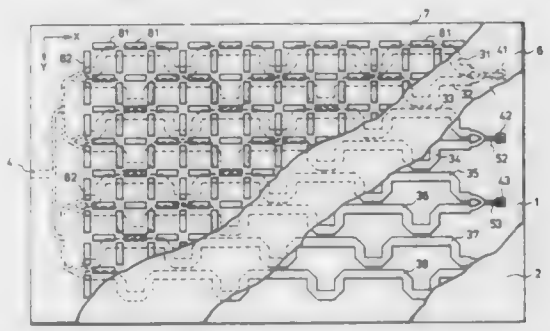
1. A planar microstrip antenna structure having a low physical profile, comprising:

an electrically conductive ground plane;

1. a dielectric layer overlying said ground plane;

an electrically conductive antenna element coupled to a second side of said dielectric layer, said antenna element having triangular shape with a first angle and a base opposite said first angle, a second angle and a second side opposite said second angle, a third angle and a third side opposite said third angle, said first angle being approximately 60° and said base being at a selected angle greater than 3° with respect to the perpendicular to a bisector of said first angle, said antenna element adapted to emit a radiation envelope pattern that is asymmetrical about boresight, the gain of said envelope pattern remaining

within 6 decibels of the maximum gain to an angle at least 60° forward from boresight toward endfire; and



a transmission line coupled to said antenna element.

5,006,858

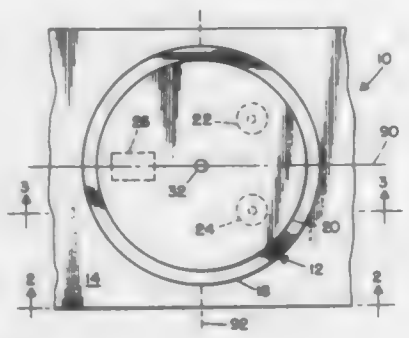
MICROSTRIP LINE ANTENNA WITH CRANK-SHAPED ELEMENTS AND RESONANT WAVEGUIDE ELEMENTS

Toshiaki Shirosaka, Toyono, Japan, assignor to DX Antenna Company, Limited, Kobe, Japan

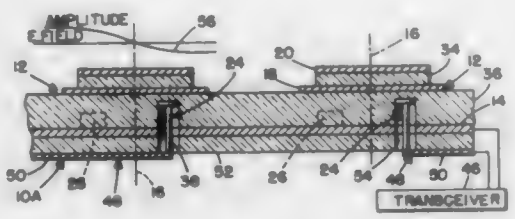
Filed Jan. 8, 1990, Ser. No. 462,137
Claims priority, application Japan, Mar. 30, 1989, 1-80694
Int. Cl.[5] H01Q *1/38*
U.S. Cl. 343—700 4 Claims

1. A plane antenna comprising:

a microstrip line antenna including a plane dielectric substrate and a plurality of parallel conductor lines arranged on said substrate along a first direction, each of said conductor lines comprising a plurality of antenna elements sequentially connected together to form a crank-shaped conductor pattern, each of said elements comprising a relatively long first segment and a relatively long second segment with said first and second segments oriented in said first direction and a relatively short third segment oriented in a second direction normal to said first direction and connecting said first and second segments together in said crank-shaped conductor pattern,



a plurality of half wavelength waveguide elements lying on a plane parallel to said substrate, extending respectively in said first and second directions and each waveguide element comprising a conductor resonant with a half wavelength of an electric wave to be used, and

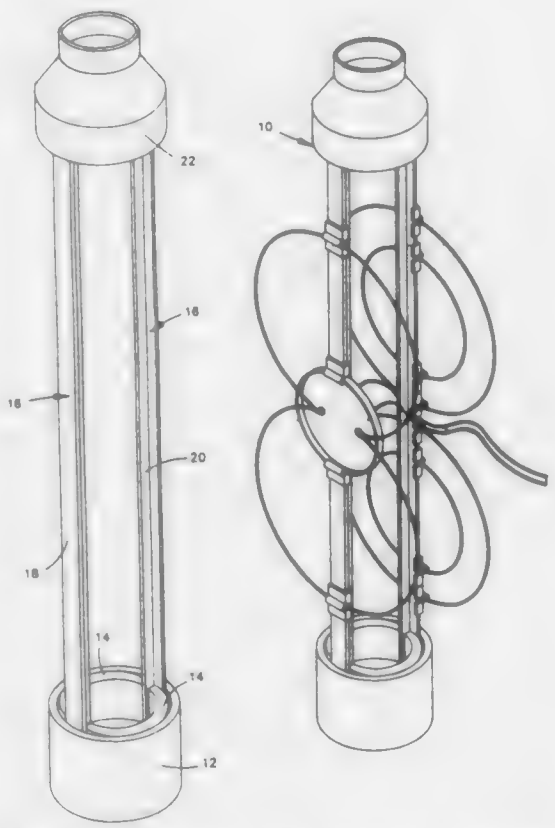


means for supporting said half wavelength waveguide elements in spaced relation to said conductor lines at at least one of a set of distances comprising about a half wavelength of said electric wave to be used and integral multiples of said half wavelength.

5,006,859
PATCH ANTENNA WITH POLARIZATION UNIFORMITY CONTROL

Mon N. Wong, Torrance; Robert J. Patin, Hawthorne; Brennan J. Trese, Los Angeles, and Krishnan K. Raghavan, Redondo Beach, all of Calif., assignors to Hughes Aircraft Company, Los Angeles, Calif.

Filed Mar. 28, 1990, Ser. No. 500,332
Int. Cl.[5] H01Q *1/38*
U.S. Cl. 343—700 MS **11 Claims**

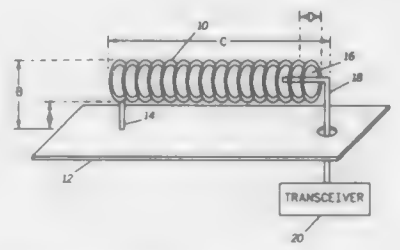


1. A patch antenna comprising:
an electrically conductive ground-plane element;
an electrically conductive patch radiator;
means for positioning said radiator in spaced-apart relation to said ground-plane element;
a first feed and a second feed disposed on said ground-plane element and capacitively coupled to said radiator, said first feed and said second feed being offset from a center of said radiator and being arranged in space-quadrature relation relative to said radiator for generation of circularly polarized radiation at said radiator; and
a capacitive reactance element disposed on said ground-plane element and capacitively coupled to said radiator, said reactance element being located equally distant from said first and second feeds and being located on a side of said radiator opposite said first and said second feeds, wherein the total reactance of said first and second feeds is larger by approximately one order of magnitude than the reactance produced by said reactance element, in order to reduce mutual coupling between said first and said second feeds and said radiator such as to counteract any elliptical polarization and to thereby ensure production of accurate and uniform circular polarization.

5,006,860
CONNECTION OF T SECTIONS BETWEEN HALF RINGS WITHIN ANNULAR HOUSING

Edward J. Schock, P.O. Box 1167, Lebanon, Pa. 17042

Filed Apr. 28, 1989, Ser. No. 345,218
Int. Cl.[5] H01Q *11/12*
U.S. Cl. 343—742 **10 Claims**



1. Connection of two T-section posts between two half rings within an annular housing, wherein:
said annular housing having a substantially circular inner wall that defines a bore within said annular housing,
said T-section posts being positioned within said annular housing such that said T-section posts extend substantially parallel to a central axis of said bore of said annular housing,
each T-section post having a stem portion extending from a center of a branch portion,
said stem portion being substantially a perpendicular bisector of said branch portion,
said branch portion of each of said T-section posts having a flat face,
said flat face of said branch portion of each of said T-section posts being positioned within said bore of said annular housing substantially against said inner wall of said annular housing,
each of said half rings being positioned within said annular housing such that each half ring has two edges that extend substantially parallel to the central axis of said bore of said annular housing,
one of said edges abutting said stem portion of one of said T-section posts and the other of said edges abutting said stem portion of the other of said T-section posts,
said edges being referred to as stem-abutting edges,
each half ring having a convex face positioned against said inner wall of said annular housing except near each T-section post,
where said branch portion of said T-section post is between said convex face of said half ring and said inner wall of said annular housing,
said stem portion of each T-section post being between one of said stem-abutting edges of one of said half rings and one of said stem-abutting edges of the other of said half rings.

5,006,861
ANTENNA

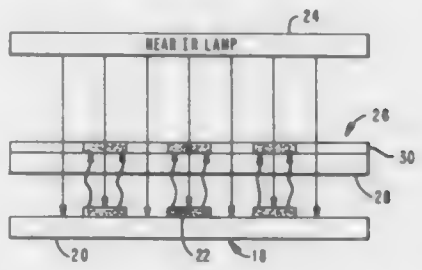
John E. Miller, Sunrise, and Frank E. Lambrecht, Hollywood, both of Fla., assignors to Motorola, Inc., Schaumburg, Ill.

Filed Apr. 20, 1989, Ser. No. 340,634
Int. Cl.[5] H01Q *1/36*
U.S. Cl. 343—848 **8 Claims**

1. An antenna, comprising:
a conductive helix having first and second ends, said first end being shorted to a ground plane and said second end being open and free from electrical connections;
an open stub positioned partially within said second end of said conductive helix for receiving a radio frequency signal, and for electromagnetically coupling said radio frequency signal into said second end of said conductive helix.

5,006,862
FIXATION OF REACTIVE DYES TO PAPER BY INK-JET PRINTING

Raymond J. Adamic, Corvallis, Oreg., assignor to Hewlett-Packard Company, Palo Alto, Calif.



Filed Oct. 27, 1989, Ser. No. 429,251
Int. Cl.[5] B41J *2/01*
U.S. Cl. 346—1.1 **12 Claims**

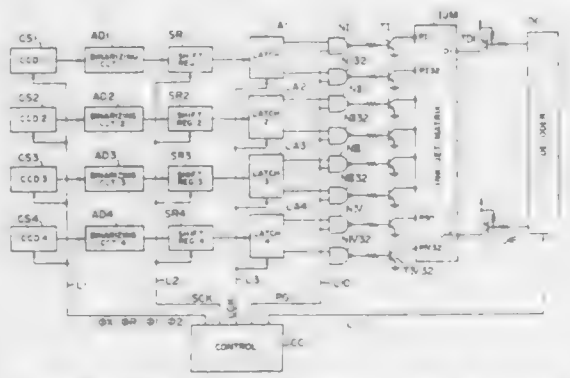
1. A process for printing reactive dyes on a medium, comprising:
(a) printing said medium with an ink-jet ink comprising
(1) about 1 to 10% of a reactive dye having a reactive moiety,
(2) about 5 to 15% of an organic solvent selected from the group consisting of 2-pyrrolidone, N-methyl pyrrolidone, and glycols, and
(3) about 75 to 94% water, said ink having a pH adjusted to about 5 to 9; and
(b) treating said medium with a basic alcoholic solution containing from about 90% to about 100% alcohol, by weight, of an alcohol having from 1 to 6 carbon atoms, said alcoholic solution having a pH from about 10 to about 13.

5,006,863
MULTIPLE COPY THERMAL IMAGING

Shashi G. Talvalkar, Kettering, Ohio, assignor to NCR Corporation, Dayton, Ohio

Continuation-in-part of Ser. No. 87,543, Jul. 6, 1987, abandoned. This application Feb. 8, 1989, Ser. No. 307,456
Int. Cl.[5] G01D *9/00;* **B29C** *47/00;* **B41M** *3/12, 5/20;* **G03C** *5/18*
U.S. Cl. 346—1.1 **19 Claims**

6. A heat sensitive copy system for creating an original image and a copy of said image and accomplished in a two-step, in-line process, said copy system comprising a
first medium having a thermal transfer coating thereon, said thermal transfer coating including near infra-red absorbing material, a
second medium adjacent the first medium,
means for selectively heating a portion of the thermal transfer coating on the first medium for transferring coating material in the form of original images onto the second medium during the first step of the process,
copy medium adjacent the second medium, and
means producing near infra-red radiation for heating the original images on the second medium and transferring the original images therefrom onto the copy medium and creating copies of the original images on said copy medium during the second step of the process.



5,006,864
INFORMATION READ-OUT AND RECORDING APPARATUS

Naoki Ayata; Yoshiaki Shirato, both of Yokohama; Yasushi Takatori, Sagamihara, and Mitsuaki Seki, Machida, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

Continuation of Ser. No. 379,668, Jul. 13, 1989, abandoned, which is a continuation of Ser. No. 287,527, Dec. 19, 1988, abandoned, which is a continuation of Ser. No. 036,179, Apr. 8, 1987, abandoned, which is a continuation of Ser. No. 624,714, Jun. 26, 1984, abandoned, which is a division of Ser. No. 133,327, Mar. 24, 1980, Pat. No. 4,463,359. Claims priority, application Japan, Apr. 2, 1979, 54-39467; Apr. 2, 1979, 54-39468; Apr. 2, 1979, 54-39469; Apr. 2, 1979, 54-39470; Apr. 2, 1979, 54-39471; Apr. 2, 1979, 54-39472; Apr. 11, 1979, 54-43849; Feb. 22, 1980, 55-21348
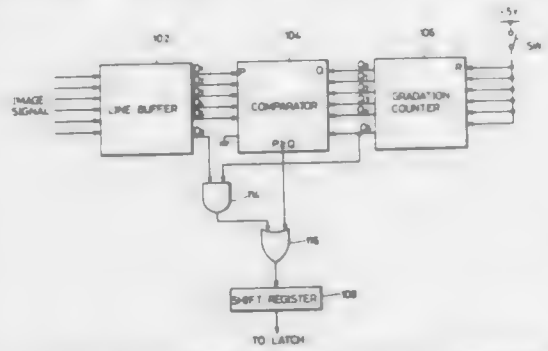
Int. Cl.[5] B41J *2/01*
U.S. Cl. 346—33 R **159 Claims**

1. An information read-out and recording apparatus comprising:
information read-out means for serially outputting information signals;
serial-input/parallel-output register means connected to said information read-out means for storing information signals received serially from said information read-out means;
latch means connected to said register means for storing signals provided in parallel from said register means;
recording means connected to said latch means for recording on a recording medium in accordance with the output of said latch means; and
control means connected to said information read-out means, said register means, said latch means and said recording means, and having a first control function for

providing parallel storage in said latch means of the contents of said register means after a predetermined number of bits of information have been serially stored in said



register means and a second control function for providing serial storage in said register means of at least one bit of information during operation of said recording means.

5,006,865

METHOD OF RECORDING GRADATION IMAGE IN THERMAL PRINTER

Yoshihiko Kuroiwa, Nagano, Japan, assignor to Fuji Photo Film Co., Kanagawa and Nagano Nihon Musen K.K., Nagano, both of, Japan

Filed Apr. 20, 1989, Ser. No. 340,816
Claims priority, application Japan, Apr. 20, 1988, 63-97708
Int. Cl.[5] G01D *15/10*
U.S. Cl. 346—76 PH **9 Claims**

6. A method of recording a gradation image on a thermosensitive medium in a thermal printer with heating elements, comprising the steps of:

generating first pulse signals each for forming a one-gradation image, said first pulse signals each including a first unit pulse signal and a second unit pulse signal;

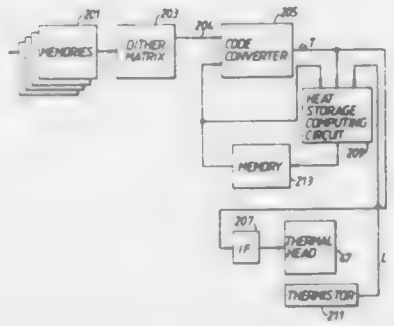
generating second pulse signals each for forming a plural-gradation image from an image signal;

energizing said heating elements with said first and second pulse signals which are combined together to record said gradation image with said one-gradation image as a minimum density unit thereof;

wherein the step of energizing said hating elements further comprises:

energizing said hating elements with said first unit pulse signal;

then energizing said heating elements with said second pulse signals;



thereafter energizing said heating elements with said second unit pulse signal.

5,006,866

THERMAL PRINTING APPARATUS RESPONSIVE TO ESTIMATED STORED HEAT OF THE HEATING ELEMENT

Akihiko Someya, Kanagawa, Japan, assignor to Kabushiki Kaisha Toshiba, Kawasaki, Japan

Filed Oct. 12, 1989, Ser. No. 420,824
Claims priority, application Japan, Oct. 31, 1988, 63-275221
Int. Cl.[5] Q01D *15/10*
U.S. Cl. 346—76 PH **11 Claims**

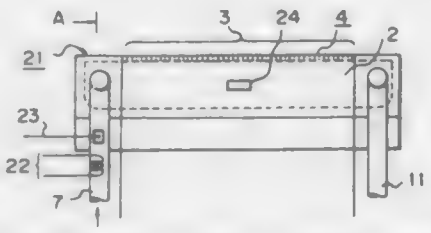
1. A thermal printing apparatus for generating heat to produce an output image according to an input image, comprising:

driving means for supplying a driving signal corresponding to the input image;

a thermal head comprising a base and a heating element array on the base, responsive to an input signal, for generating heat to produce the output image;

generating means for generating a temperature signal representative of a temperature of the base;

predicting means, for generating an estimated stored heat signal representative of an estimated stored heat in the heating element array based on the combination of the temperature signal and the driving signal; and



controlling means, responsive to the driving signal and the estimated stored heat signal, for generating the input signal.

5,006,867

RECORDING HEAD FOR AN INK JET RECORDING APPARATUS HAVING A PLURALITY OF TEMPERATURE DETECTION ELEMENTS

Yutaka Koizumi, Tokyo; Minoru Nozawa; Toshihiro Mori, both of Hiratsuka, and Atsushi Saito, Yokohama, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

Continuation of Ser. No. 272,471, Nov. 17, 1988, abandoned.
This application May 7, 1990, Ser. No. 518,238
Claims priority, application Japan, Nov. 20, 1987, 62-291965
Int. Cl.[5] B41J *2/195*
U.S. Cl. 346—140 R **10 Claims**

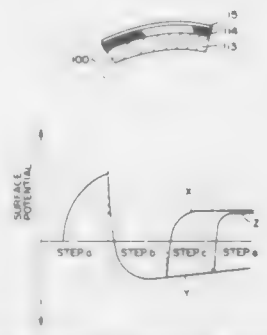
1. A recording head for an ink jet recording apparatus provided with a temperature adjusting device, said recording head comprising:

a discharging area provided with a plurality of ink discharging portions each having an electric-heat converting member;

a common chamber for receiving ink, said common chamber communicated with said discharging area and supplying ink to each of said ink discharging portions;

a plurality of temperature detecting elements for detecting temperature at different locations of said common chamber; and

heat controlling means for equalizing the temperature distribution of said common chamber in response to temperatures detected by said plurality of temperature detecting elements;



wherein the temperature distribution is equalized by adjusting the temperature of ink supplied to said common chamber.

METHOD AND APPARATUS FOR PRINTING TWO OR MORE COLORS USING AN ELECTROPHOTOGRAPHIC PROCESS

Koichi Kinoshita, Shizuoka, Japan, assignor to Kentek Information Systems, Inc., Allendale, N.J.

Filed Nov. 28, 1989, Ser. No. 443,246
Int. Cl.[5] G03G *15/01*; **G01D** *9/42, 15/14*
U.S. Cl. 346—157 **14 Claims**

1. A method for printing a two-color image comprising

(a) uniformly charging a surface of a photoconductive member to a surface potential of a first polarity,

(b) uniformly reverse polarity charging said surface of said photoconductive member while simultaneously selectively exposing said photoconductive member to light generated by a first light source under the control of a digital processing unit to form a first latent electrostatic image on said photocondcutive member,

(c) prior to developing said first latent electrostatic image, selectively exposing said photoconductive member to light generated by a second light source under control of said digital processing unit to form a second latent electrostatic image on said photoconductive member,

(d) developing said second latent image utilizing a first toner of a first color and having a first electrostatic charge,

(e) uniformly illuminating said photoconductive member, and

(f) thereafter developing said first latent image utilizing a second toner of a second color and having a second electrostatic charge opposite in polarity to said first electrostatic charge.

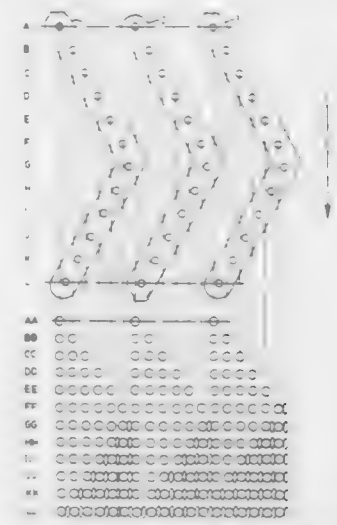
CHARGED PARTICLE PRINTER

W. R. Buchan, Pocasset, Mass., and Robert S. McCallum, Terra Cotta, Canada, assignors to Delphax Systems, Mississauga, Canada



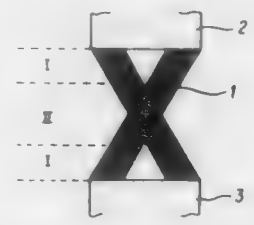
Filed Nov. 8, 1989, Ser. No. 433,110
Int. Cl.[5] G01D *15/06*
U.S. Cl. 346—159 **11 Claims**

1. A print cartridge for charged particle deposition of latent images on a receptor surface adapted to move longitudinally, the cartridge comprising:

driver electodes extending transversely with respect to said direction;

dielectric means covering the electrodes;

finger electrodes on the dielectric means extending angularly with respect to the driver electrodes, the finger and driver electrodes being separated physically from one another by the dielectric means, the finger electrodes defining apertures where the finger electrodes cross the driver electrodes to thereby define edge structures for charged particle generation upon selectively energizing the driver and finger electrodes to place dots on selected segments of the print cartridge, the segment for each finger electrode being immediately adjacent a segment of



another finger electrode and the apertures being arranged in relation to the desired image such that when the image is to be a continuous line of contiguous dots, at least some of the apertures activated in each of the finger electrodes to place a dot in each segment are spaced from transversely from an adjacent aperture in the same finger electrode by an unequal whole number of dot positions, and in which the first dot is a primary dot, the electrodes being operable to energize the apertures in sequence along the length of the finger electrodes to create further primary dots which are separated from one another and then to complete the line by creating secondary dots between the primary dots.

5,006,870

THERMAL RECORDING HEAD

Shuzo Hirahara, and Kazuhiko Higuchi, both of Kanagawa, Japan, assignors to Kabushiki Kaisha Toshiba, Kanagawa, Japan

Filed Sep. 26, 1988, Ser. No. 248,847
Claims priority, application Japan, Sep. 30, 1987, 62-249034
Int. Cl.[5] G01D *15/10*
U.S. Cl. 346—76 PH **11 Claims**

1. A thermal recording head comprising:

a plurality of electrode pairs, each of the electrode pairs including a first and a second electrode; and

a corresponding plurality of heating elements, each of the heating elements being disposed between a corresponding electrode pair and including first, second and third portions, the first and second portions being coupled to the first and second electrodes, respectively, and the third portion having a center and two ends and being positioned between and connecting the first and second portions, the third portion having a current density that increases from the respective ends towards the center of the third portion and the first and second portions having a uniformly distributed current density upon application of a voltage across the first and second electrodes.

5,006,871

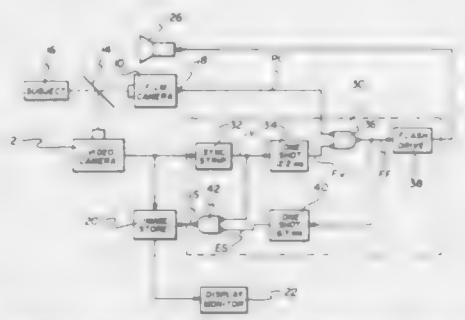


IMAGE RECORDING SYSTEM AND METHOD

Stephen A. Noble, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y.

Filed May 23, 1990, Ser. No. 528,000

Int. Cl.[5] G03B *29/00, 7/00, 15/05;* **H04N** *5/225*

U.S. Cl. 354—76 **7 Claims**

1. An image recording system for simultaneously recording images of a subject in electronic and photosensitive media, comprising:

a photographic camera for capturing a photographic image of said subject on said photosensitive medium, said photographic camera including means for supplying a flash request signal;

a video camera for generating a video signal comprised of alternating video image fields and vertical blanking intervals, said camera including solid state imaging means for capturing a video image of said subject and means for processing said captured image during said vertical blanking intervals into successive fields of video image signals;

means for illuminating said subject with a flash illumination of a predetermined maximum duration;

means for separating vertical blanking signals from said camera video signal; and

flash synchronizing means responsive to said separated vertical blanking signals for enabling initiation of said flash illumination only during a limited time interval following each successive vertical blanking interval, said limited time interval ending at a point in the video signal image field that assures that a flash illumination of said maximum duration initiated at any time in said limited time interval will be substantially completed before the processing of the captured image from said imaging means is initiated in the next successive vertical blanking interval.

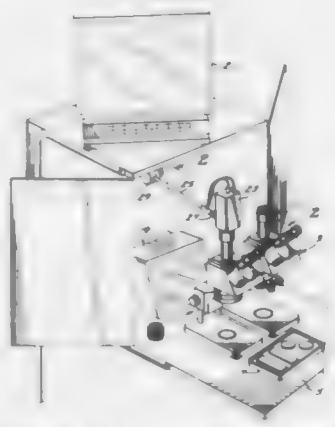
5,006,872

VIDEO ATTACHMENT SYSTEM FOR MICROSCOPES

Walter D. Parker, Saugus, Calif., assignor to Mideo Systems, Inc., Huntington Beach, Calif.

Filed Dec. 6, 1989, Ser. No. 446,633

Int. Cl.[5] G03B *17/48*



U.S. Cl. 354—79 **1 Claim**

1. A support system for supporting a video camera relative to a microscope camera port, the video camera having a lens mount opening, the support system comprising:

means for supporting the video camera at selected locations in selected positions within a three-dimensional space;

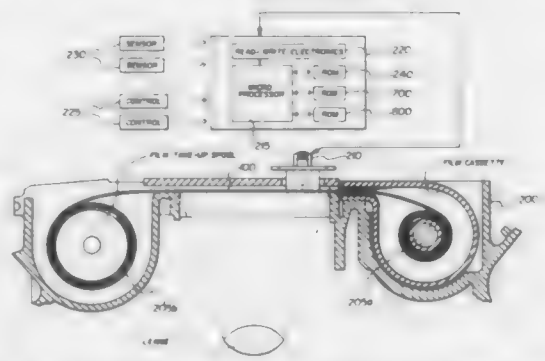
a tube securable in the microscope camera port;

a sleeve having one end engaged with said tube to form a generally cylindrical structure and adapted to provide

for adjustment of the longitudinal dimension of said generally cylindrical structure, and having the other end adapted to slidably engage the lens mount opening of the video camera in alignment with the microscope camera port, whereby the video camera is substantially supported in position by said support means; and

a diaphragm formed in said sleeve.

5,006,873



IMPLICIT MID ROLL INTERRUPT PROTECTION CODE FOR CAMERA USING DEDICATED MAGNETIC TRACKS ON FILM

Michael L. Wash, Pittsford, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y.

Continuation of Ser. No. 255,672, Oct. 7, 1988, abandoned. This application Dec. 5, 1989, Ser. No. 449,343

Int. Cl.[5] G03B *17/24*

U.S. Cl. 354—106 **12 Claims**

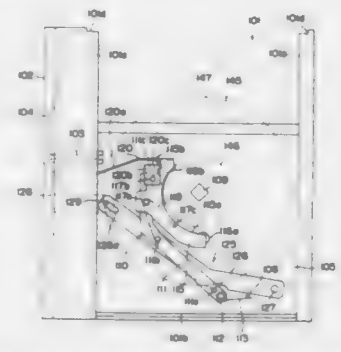
1. In a camera having a magnetic read/write system with a magnetic head and adapted to receive magnetically coated film, a method of preventing double exposures of individual frames of said film, said film adapted to recording of magnetic data therein by the manufacturer, thereof prior to being received in said camera, said method comprising:

recording data, including a camera-dedicated ID sentinel, with each exposure by said camera of a frame in said film so as to record at least one magnetic track in said film which starts at a location proximal said frame;

transporting successive frames of said film past said magnetic head while causing said magnetic system to search for data corresponding to said camera ID sentinel until finding one frame in which said magnetic system senses an absence of camera-dedicated ID sentinels, and thereupon juxtaposing said one frame in said camera in preparation for the exposure of said one frame.

5,006,874

APPARATUS FOR RECORDING IMAGES ON A ROLL OF FILM AND A FILM WINDING CARTRIDGE



Masanori Murakami; Akiyoshi Hamada; Mitsutoshi Yagoto, all of Toyokawa, and Shinichi Mori, Gifu, all of Japan, assignors to Minolta Camera Kabushiki Kaisha, Osaka, Japan

Filed Jun. 28, 1990, Ser. No. 544,918

Claims priority, application Japan, Jun. 29, 1989, 1-168492

Int. Cl.[5] G03B *27/58*

U.S. Cl. 354—212 **11 Claims**

1. Apparatus for recording images on a roll of film, comprising:

means for feeding a film to an image recording section;

means for recording an image on the film fed by the film feeding means; and

means for winding the film on which an image was recorded, said film winding means comprising:

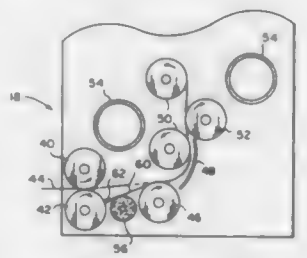
a reel to be wound with the film;

a first and a second casing for housing the reel in such a manner as the reel can be dismounted, said casings capable of being integrated and disintegrated by moving in a direction perpendicular to the axis of the reel;

first guide means disposed in the first casing for forcing the film wound around the reel toward the center of the reel elastically; and

second guide means disposed in the second casing for forcing the film wound around the reel toward the center of the reel elastically.

5,006,875



FILM PROCESSOR WITH ABSORBENT ROLLER TO ELIMINATE WATER SPOTTING

Kenneth W. Oemcke, and Evan P. Carmichael, both of Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.

Filed Jun. 11, 1990, Ser. No. 535,627

Int. Cl.[5] G03D *3/13*

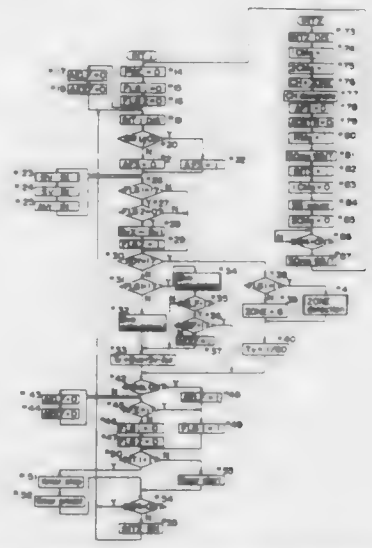
U.S. Cl. 354—299 **3 Claims**

1. In a processor for sheets of film, the processor having racks of rollers for transporting the film sequentially through stations for developing the film, fixing the film, washing the film and drying the film, the rollers including a pair of squeegee rollers located where the film leaves the washing station for driving the film into the drying station, and the transport rollers in the drying station being spaced from the squeegee rollers and defining a path for the film leaving the squeegee rollers, the film path including a first portion adjacent the squeegee rollers and a second portion downstream from the first portion, the second portion being positioned at an angle with respect to the first portion so that the trailing end of the film is deflected out of the first portion of the film path when the leading end of the film enters the second portion of the path and the trailing end leaves the squeegee rollers, the improvement comprising:

an absorbent roller in the drying station located outside the first portion of the film path between the squeegee rollers and transport rollers in the drying station so that the absorbent roller is not contacted by the film as the film is driven along the first portion of the film path by the squeegee rollers, the absorbent roller being positioned with respect to the first portion of the path so that it is contacted by the trailing end of the film when the trailing end leaves the squeegee rollers and is deflected out of the first portion of the film path, whereby a bead of liquid on the trailing end of the film can be removed by the absorbent roller.

5,006,876

EXPOSURE CALCULATING DEVICE



Masaaki Nakai, Kawachinagano, Japan, assignor to Minolta Camera Kabushiki Kaisha, Osaka, Japan

Continuation of Ser. No. 147,271, Jan. 22, 1988, abandoned, which is a division of Ser. No. 832,702, Feb. 25, 1986, Pat. No. 4,746,947. This application Oct. 16, 1989, Ser. No. 423,557

Claims priority, application Japan, Feb. 25, 1985, 60-36019; Mar. 19, 1985, 60-55017

Int. Cl.[5] G03B *7/08, 13/36*

U.S. Cl. 354—400 **2 Claims**

1. An exposure calculating device for use in a camera having a shutter, said shutter being adapted to be released in response to a shutter release operation, said exposure calculating device comprising:

means for automatically adjusting a focusing condition of an objective lens to produce an in-focus signal when the objective lens has been adjusted to its in-focus position;

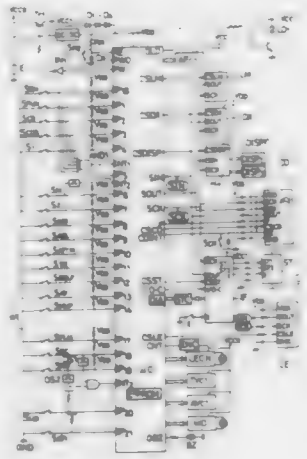
means for producing a lock signal in response to a manual operation independent of the shutter-release operation,

the lock signal being effective even if the in-focus signal has not been produced;

means for measuring brightness of an object field to produce a brightness information corresponding to the measured brightness;

means for storing the brightness information;

means for controlling said storing means to store the brightness information in response to the in-focus signal or the lock signal; and



means for interrupting the operation of said controlling means when the brightness information has been stored in response to the lock signal even if the in-focus signal is produced.

CAMERA SYSTEM

Takehiro Katoh; Yoshihiko Azuma; Masayasu Hirano; Naohiro Kageyama; Toshihiko Ishimura; Kenji Tsuji, and Hiroshi Ootsuka, all of Osaka, Japan, assignors to Minolta Camera Kabushiki Kaisha, Osaka, Japan

Continuation of Ser. No. 352,495, May 16, 1989, abandoned.
This application Apr. 17, 1990, Ser. No. 511,962
Claims priority, application Japan, May 16, 1988, 63-120305; May 28, 1988, 63-131289; May 28, 1988, 63-131290
Int. Cl.[5] G03B 7/00
U.S. Cl. 354—412 6 Claims

1. Camera system, comprising:

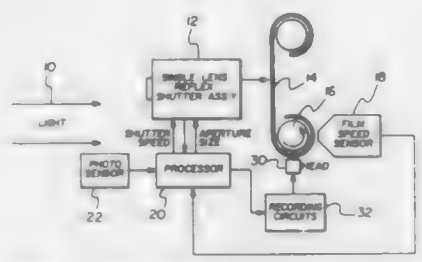
means for measuring brightness of a photographic scene to send a brightness value;

a plurality of exposure lines in which each exposure line selects a combination of an aperture value and a shutter speed value at each brightness value;

means for choosing one of the exposure lines;

an operable member;

means for driving a film in either of a first film driving mode in which the film is wound by only one frame in response to the operation of the operable member and a second film driving mode in which the film is wound frame by frame continuously as long as the operable member is operated; and



first selecting means for selecting one film driving mode from the first and second film driving modes is accordance with the exposure line chosen by the choosing means.

5,006,878

MAGNETIC RECORDING ON FILM OF BEYOND CAMERA EXPOSURE VALUE RANGE INDICATION

Robert P. Cloutier, Spencerport, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y.

Filed Sep. 11, 1989, Ser. No. 405,815
Int. Cl.[5] G03B 7/00
U.S. Cl. 354—412 7 Claims

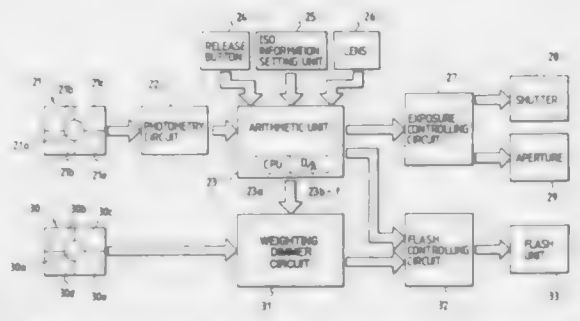
1. A camera having a shutter assembly, means for sensing scene brightness, means for sensing film speed, and means for controlling shutter exposure time and shutter aperture size of the shutter assembly, said camera being suitable for photographically exposing successive frames of a film strip having a virtually transparent magnetic layer, and further comprising:

magnetic head means for recording in said magnetic layer of said film strip; and

a processor including means for:

a. computing an ideal exposure value from a film speed value and a scene brightness value furnished by said means for sensing said film speed and said means for sensing said scene brightness, respectively,

b. sensing maximum and minimum aperture sizes and shutter speed of which said shutter assembly is capable and computing therefrom an exposure value range of said camera, and



c. determining whether said ideal exposure value lies within said camera exposure value range and, if not, transmitting a beyond camera exposure value range indication to said magnetic head means for recording in said magnetic layer of said film strip in a location on said film strip adjacent or within a corresponding film frame.

5,006,879

ELECTRONIC FLASH LIGHTING DEVICE FOR CAMERA

Tadao Takagi, Yokohama, and Toshihiro Sato, Tokyo, both of Japan, assignors to Nikon Corporation, Tokyo, Japan

Filed Sep. 21, 1989, Ser. No. 410,659
Claims priority, application Japan, Sep. 26, 1988, 63-238976
Int. Cl.[5] G03B 7/00
U.S. Cl. 354—413 14 Claims

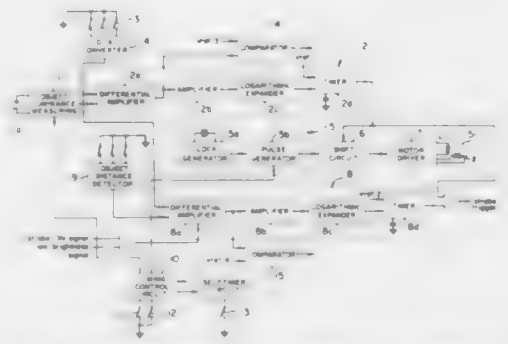
1. An electronic flash lighting device having flash producing means to produce a flash emission for lighting a field to be photographed, comprising:

first light measuring means for measuring the brightness of the field at a non-flash-emission time of said flash producing means and outputting a corresponding first light measurement output;

second light measuring means for measuring the brightness of a plurality of divided areas of the field during flash emission of said flash producing means and outputting a plurality of corresponding second light measurement signals;

determining means for determining weights for said plurality of second light measurement signals in accordance with said first light measurement output prior to the start of flash emission of said flash producing means;

weighting means for weighting said plurality of second light measurement signals in accordance with the weights determined by said determining means; and



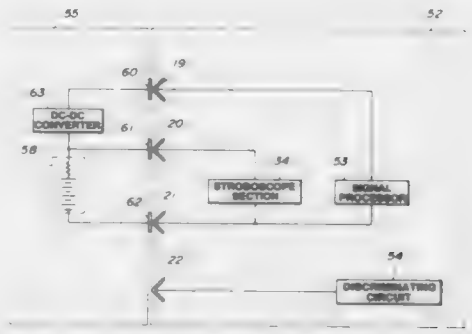
flash control means for controlling the stopping of flash emission of said flash producing means in accordance with the plurality of weighted second light measurement signals.

5,006,880

PROGRAMMABLE SHUTTER

Masuo Ogihara; Hajime Oda; Yoichi Seki, and Hiroshi Yamazaki, all of Yotsukaido, Japan, assignors to Seikosha Co., Ltd., Japan

Continuation of Ser. No. 85,979, Aug. 14, 1987, which is a division of Ser. No. 766,032, Aug. 15, 1985, Pat. No. 4,693,583.
This application Apr. 24, 1989, Ser. No. 342,660
Claims priority, application Japan, Aug. 15, 1984, 59-170277
Int. Cl.[5] G03B 7/087
U.S. Cl. 354—427 9 Claims



1. A programmable shutter for a camera comprising: a set of shutter sectors mounted to undergo displacement in opening and closing directions to define an exposure interval; sector driving means including a bidirectional stepping motor rotationally driveable in forward and reverse directions in response to forward and reverse driving pulses for effecting displacement of the shutter sectors in the opening and closing directions during the exposure interval; brightness measuring means for measuring the brightness of an object to be photographed during the displacement of the shutter sectors in the forward direction and producing a logarithmically compressed output signal indicative of the measured object brightness; means responsive to the output signal for processing the output signal to produce a processed signal and for logarithmically expanding the processed signal to produce a control signal after a lapse of time which is dependent on the measured object brightness to thereby determine the timing at which the shutter sectors are reversed from the forward direction to the reverse direction; and stepping motor driving means for applying forward driving pulses of a given phase to the stepping motor to effect forward stepwise rotation thereof and responsive to the control signal to forcibly reverse the phase of the driving pulses in coincidence with the control signal even during the application of a driving pulse to thereafter apply reverse driving pulses to the stepping motor to effect reverse stepwise rotation thereof.

5,006,881

BATTERY SUPPLYING APPARATUS FOR CAMERA

Yasumasa Kodama, Kanagawa, Japan, assignor to Sony Corporation, Tokyo, Japan

Filed Oct. 11, 1989, Ser. No. 419,751
Claims priority, application Japan, Oct. 14, 1988, 63-259013
Int. Cl.[5] G03B 7/26; H04N 5/225
U.S. Cl. 354—484 12 Claims

5. An electric power supply system for a camera comprising:

image pick-up means for generating a signal representing an image in a field of view of the camera;

a signal processor for processing the signal from said image pick-up means into a recordable signal;

recording means for recording the recordable signal from said signal processor onto a recording medium;

strobe means for emitting stroboscopic light, said strobe means including a charging circuit being capable of supplying a large current for exciting a lamp to generate the stroboscopic light;

means for selectively holding a first battery package having a battery with known internal resistance or holding a second battery package having a battery with an internal resistance smaller than said known internal resistance where said first battery package and said second battery package have substantially identical dimensions;

discriminating means for determining whether said first battery package or said second battery package is held by said means for holding; and

voltage stabilizer means for stabilizing a voltage output from said first battery package and producing a substantially constant output voltage, wherein said signal processor receives the constant voltage from said voltage stabilizer when said discriminating means determines that said means for holding holds said first battery package.

IMAGE RECORDING APPARATUS

Keiichi Horikiri, Tokyo, Japan, assignor to Seiko Instruments Inc., Japan

Filed Aug. 3, 1989, Ser. No. 389,009
Claims priority, application Japan, Aug. 26, 1988, 63-112648[U]; Apr. 27, 1989, 1-108417
Int. Cl.[5] G03B 27/32
U.S. Cl. 355—27 27 Claims

1. An image forming apparatus for forming a latent image on a photosensitive medium having capsules containing chromogenic material and a radiation curable composition on one surface thereof and developing the latent image by rupturing the capsules and contacting the chromogenic material with a developer material, comprising:

exposure means for exposing the photosenaitive medium to light representative of an image to form a latent image thereof on the photosensitive medium;

a sheet having the developer material on one surface thereof;

feeding means for feeding the sheet into the image forming apparatus, the feeding means having suction means disposed at one end of a movable member, the other end of the member contacting the surface of the sheet at a point

of contact and being turnable around the point of contact, whereby the sheet is sucked by the suction means and lifted up by turning the suction means around the point of contact;

developing means for rupturing the capsules and contacting the chromogenic material with the developer material on the surface of the sheet; and

conveyor means for conveying the sheet fed by the feeding means to the developing means.

SUPERIMPOSING IMAGE APPARATUS

Nathan Greenspan, 3908 N. 29th Ave., Hollywood, Fla. 33020

Filed Sep. 10, 1990, Ser. No. 579,599

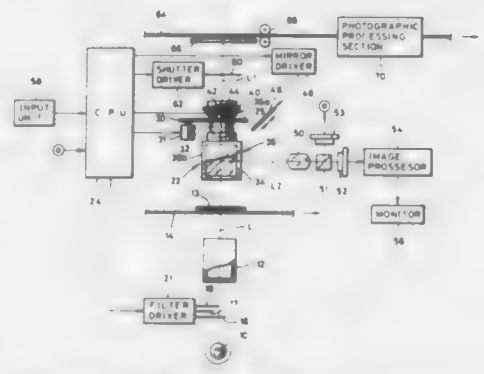
Int. Cl.[5] G03B *27/52, 27/70*

U.S. Cl. 355—43 **10 Claims**

1. A superimposing image apparatus for superimposing at least one first view on a second view, comprising optic means having a given focal length and an image plane for receiving said first and second views, at least one first mirror for reflecting said first view onto said image plane, wherein said first and second views are disposed at distances from said optic means equal to said given focal length, and said first mirror is disposed at a distance from said optic means different from said given focal length.

5,006,886

PHOTOGRAPHIC PRINTER



Kenji Suzuki, Kanagawa, Japan, assignor to Fuji Photo Film Co., Ltd., Kanagawa, Japan

Filed Apr. 19, 1990, Ser. No. 511,138

Claims priority, application Japan, Apr. 20, 1989, 1-100963

Int. Cl.[5] G03B *27/44*

U.S. Cl. 355—46 **11 Claims**

1. A photographic printer comprising:

a light source for projecting printing light toward a photographic film to print an image, recorded on said photographic film, on a photosensitive material;

a beam splitter for reflecting a part of the printing light passing through said photographic film perpendicularly to the printing light path;

sensor means for receiving said part of said printing light;

a zoom lens, fitted to said beam splitter as a unit, for printing an image of a size equal to or smaller than a frame size of 135 film, said zoom lens being disposed between said beam splitter and said photosensitive material;

at least one fixed focus lens for printing images of a size other than that equal to or smaller than said frame size of said 135 film;

setting means for setting either one of said zoom lens or said at least one fixed focus lens in the printing light path between said photographic film and said photographic material;

reflection means, removably insertable in the printing light path between said fixed focus lens and said photographic film when said fixed focus lens is set in the printing light path, for reflecting light perpendicularly to the printing light path toward said sensor means; and

means for driving said reflection means to move in and out of said printing light path, when said at least one fixed focus lens is set in said printing light path.

IMAGE FORMING APPARATUS

Mitsuru Ogura, Nara, Japan, assignor to Sharp Kabushiki Kaisha, Osaka, Japan

Filed Feb. 14, 1990, Ser. No. 479,866

Claims priority, application Japan, Mar. 7, 1989, 1-25635[U]; Mar. 7, 1989, 1-25636[U]; **Mar. 7, 1989, 1-54355**

Int. Cl.[5] G03B *27/58*

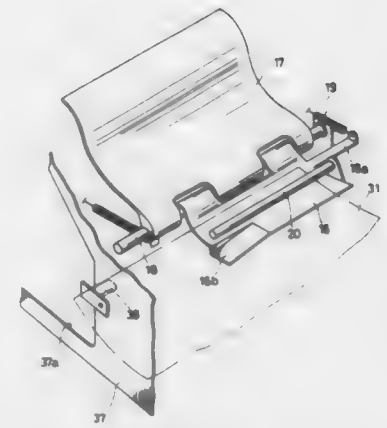
U.S. Cl. 355—72 **14 Claims**

1. An image forming apparatus comprising:

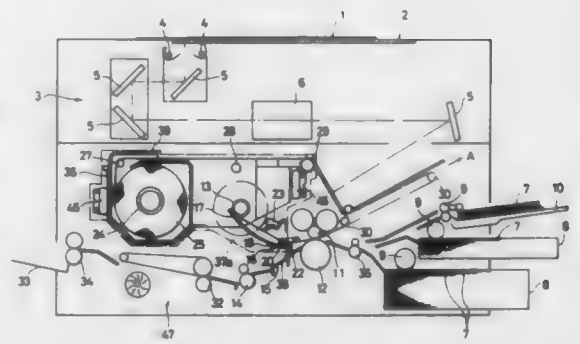
a photosensitive sheet wound in a roll;

a carriage that contains said photosensitive sheet and that is freely installed in and removed from the main body of said apparatus;

copy paper whereon a latent image that was formed on said photosensitive sheet through an exposure operation is transferred;



pressure developing rollers that superpose and press said photosensitive sheet and said copy paper;



winding shaft whereon said photosensitive sheet is wound after use;

loading guide plate that guides, together with said pressure developing rollers, the forefront portion of said photosensitive sheet toward said winding shaft through a loading mechanism, when said photosensitive sheet is loaded in the main body of said apparatus;

a horizontal shaft expanding in the cross direction of said loading guide plate and in parallel with the surface of said loading guide plate;

loading guide plate maintaining means that is connected to an edge section of said loading guide plate through a junction section;

a loading guide driving member mounted on a member of the main body of said apparatus, that drives said loading guide plate to a loading position when said loading guide plate is removed together with said carriage;

winding sensing means that functions in accordance with a stretching action of said photosensitive sheet when the forefront portion of said photosensitive sheet is wound on said winding shaft; and

copy paper guide plate that guides said copy paper whereon a latent image was transferred during the image forming operation, in a prescribed transport direction,

said loading guide plate being capable of pivoting freely, formed integrally with said carriage, and installed on the opposite side of a jam processing operation section located inside said apparatus.

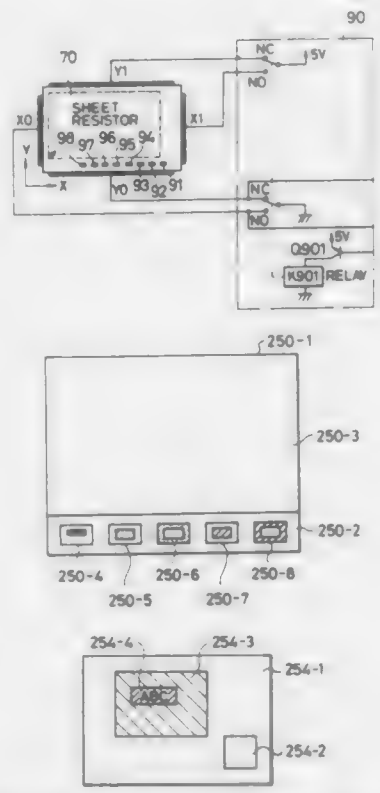
IMAGE FORMING APPARATUS WITH A PROVISION FOR DESIGNATING DIFFERENT COLORED IMAGE AREAS



Masato Ishida, Yokohama; Hiroaki Takeda, Kawasaki; Kazuo Watanabe; Akira Suzuki, both of Yokohama; Nobuyuki Suzuki, Musashino; Isamu Sato, and Kazuki Miyamato, both of Yokohama, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

Continuation of Ser. No. 930,911, Nov. 17, 1986, abandoned. This application Aug. 29, 1989, Ser. No. 401,569

Claims priority, application Japan, Nov. 18, 1985, 60-258107; Nov. 18, 1985, 60-258108; Nov. 18, 1985, 60-258113; Nov. 18, 1985, 60-258114; Nov. 18, 1985, 60-258115; Nov. 18, 1985, 60-258116; Nov. 18, 1985, 60-258118

Int. Cl.[5] G03G *15/00, 15/01, 15/04*

U.S. Cl. 355—202 **21 Claims**

1. An image forming apparatus comprising:

exposing means for exposing an original;

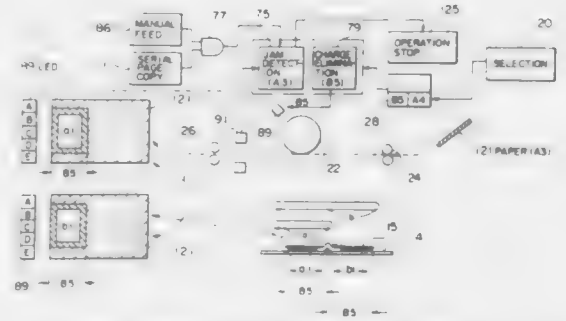
designating means for designating an arbitrary area of an original;

image forming means for forming said exposed original image on a recording member, wherein said image forming means includes predetermined image forming means for forming a predetermined image within said designated area without exposing the original by said exposing means, wherein said image forming means includes a first visualizing unit and a second visualizing unit, wherein said first visualizing unit visualizes an image with a first color, and wherein said second visualizing unit visualizes an image with a second color; and

control means for controlling said image forming means such that said predetermined image and said original image are formed within said designated area with an overlap operation, wherein said control means controls said image forming mean such that said predetermined image is formed with the first color and such that said original image is formed with the second color.

5,006,891

IMAGE FORMING APPARATUS CAPABLE OF PERFORMING SERIAL PAGE COPY



Seitaro Kasahara; Haruo Itakura, and Susumu Kurihara, all of Hachioji, Japan, assignors to Konica Corporation, Tokyo, Japan

Filed Jul. 16, 1990, Ser. No. 552,939

Claims priority, application Japan, Jul. 18, 1989, 1-185100

Int. Cl.[5] G03G *21/00*

U.S. Cl. 355—208 **6 Claims**

1. An image forming apparatus with a serial page copy function, wherein, when a copy for a document such as a book is carried out, the serial page copy function performs a copy for each of pages by separately sequentially scanning a first page and a second page of the document placed on a first portion and a second portion of a platen by an optical system, comprising:

serial page copy selection means;

memory means for memorizing a serial copy sheet size enabling serial page copy in case that manual feed mode is selected as a sheet feed mode and the serial page copy is to be carried out on the manual feed mode; and

indication means for selecting the same sheet size as the registered serial copy sheet size when the serial page copy is carried out on the manual feed mode and indicating the size.

5,006,892

XEROGRAPHIC SETUP AND OPERATING SYSTEM FOR ELECTROSTATOGRAPHIC REPRODUCTION MACHINES

Daniel C. Roehrs, Webster; Angelo T. Caruso, Rochester; Robert E. Grace; Robert M. Mara, both of Fairport; John G. Elliot, Penfield; Patricia J. Saraceno, Rochester, and James M. Pacer, Webster, all of N.Y., assignors to Xerox Corporation, Stamford, Conn.

Division of Ser. No. 344,774, Apr. 27, 1989. This application Jun. 6, 1990, Ser. No. 534,066

Int. Cl.[5] F03G *15/00;* **G03G** *15/04*

U.S. Cl. 355—208 **4 Claims**

1. A xerographic imaging process wherein latent electrostatic images are created on a moving photoreceptor through exposure of image originals by flash exposure means, with non-image areas of said photoreceptor being discharged by ID erase lamp means, comprising the steps of:

(a) measuring the illumination intensity of said flash exposure means for each image; and

(b) adjusting the intensity of said ID erase lamp means so that the intensity of said ID erase lamp means for each

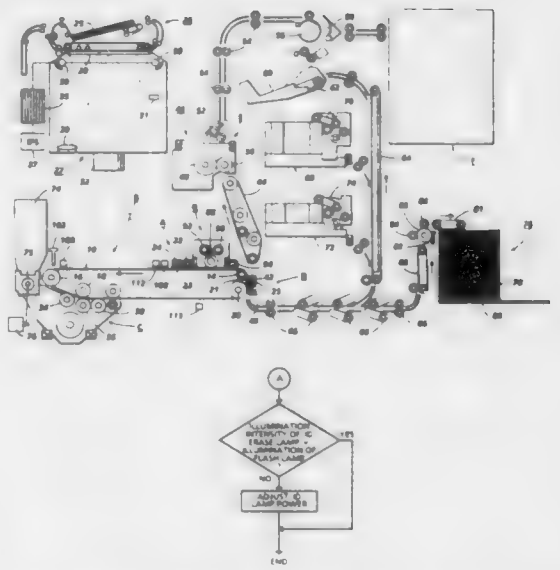


image is substantially equal to the intensity of said flash exposure means.

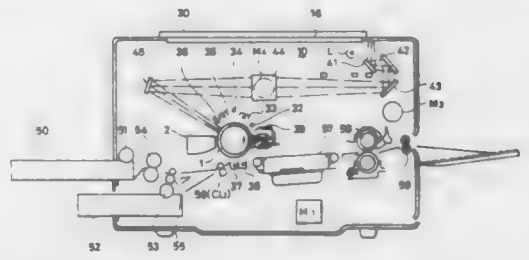
5,006,893

IMAGE FORMING APPARATUS WITH IMPROVED TONER REPLENISHMENT



Tomoaki Yokoyama, Osaka, Japan, assignor to Minolta Camera Kabushiki Kaisha, Osaka, Japan

Filed Dec. 16, 1988, Ser. No. 285,722

Claims priority, application Japan, Dec. 18, 1987, 62-322246; Dec. 18, 1987, 62-322247

Int. Cl.[5] G03G *15/00*

U.S. Cl. 355—208 **22 Claims**

1. An image forming apparatus comprising:

a photoreceptor on which a latent electrostatic image is formed;

latent electrostatic image forming means for forming a latent electrostatic image on said photoreceptor;

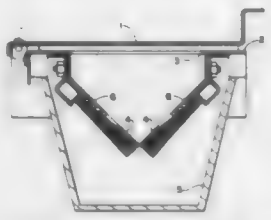
developing means for developing the latent electrostatic image on said photoreceptor by using a developer containing toner;

concentration detecting means for detecting toner concentration of said developer;

supplying means for supplying toner to said developing means;

first control means for activating said supplying means when said toner concentration detected by said concentration detecting means is lower than a prescribed concentration;

setting means for setting image forming condition; and



second control means for activating said supplying means when the image forming condition set by said setting means coincides with a prescribed condition irrespective of detection of toner concentration of the developer by the concentration detecting means.

DUST CONTAINMENT CAP FOR A PRINTING DEVICE EMPLOYING TONER

Scott S. Morris, Oklahoma City; Danny B. McGehee, Moore, and Randolph S. Canham, Yukon, all of Okla., assignors to Bull HN Information Systems Inc., Billerica, Mass.

Filed Dec. 12, 1989, Ser. No. 449,642
Int. Cl.[5] G03G *21/00*
U.S. Cl. 355—215 **9 Claims**

1. In an electrostatic printing device employing powdered toner and having a receptacle for receiving said powdered toner, said receptacle having a substantially horizontal top platelike member having a substantially rectangular opening for replenishing said toner,

a dust containment cap for use in said opening, the dust containment cap comprising:

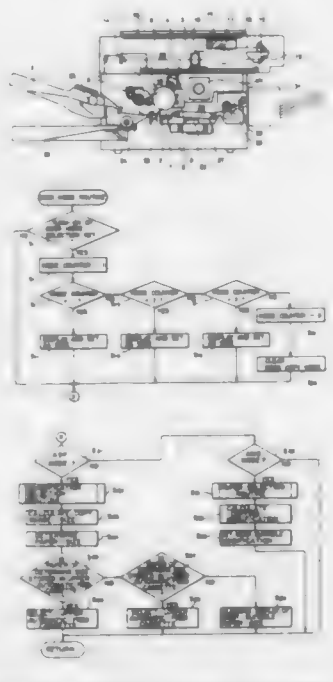
a pair of brushes each comprising an elongate member substantially equal in length to the length of the rectangular opening and having a plurality of bristles protruding from the elongate member along substantially all of its length,

the bristles being substantially parallel to one another, substantially coplanar, substantially perpendicular to the elongate member, and slightly longer than half the width of the rectangular opening,

the brushes being mounted by their elongate members to the underside of the top platelike member along opposite long sides of the rectangular opening, each with its bristles substantially horizontal and oriented toward the principal axis of the rectangular opening,

whereby the tips of the bristles of each brush overlap slightly with the tips of the bristles of the other brush along a line substantially parallel to and slightly below the principal axis of the rectangular opening,

whereby further, the bristles form around a nozzle of a toner dispenser inserted through the opening,



and whereby further, toner particles which become airborne within the receptacle in conjunction with the dispensing of toner through the nozzle are impeded by the bristles from escaping from the receptacle.

5,006,895

ELECTROPHOTOGRAPHIC COPYING APPARATUS WITH BOOK MODE MAGNIFICATION CAPABILITY

Kaoru Hashimoto, Hyogo, and Hiroyuki Ideyama, Osaka, both of Japan, assignors to Minolta Camera Kabushiki Kaisha, Osaka, Japan

Filed Jul. 15, 1988, Ser. No. 219,725
Claims priority, application Japan, Jul. 17, 1987, 62-179711
Int. Cl.[5] G03G *15/04, 21/00*
U.S. Cl. 355—243 **16 Claims**

1. An electrophotographic copying apparatus of a slit exposure type, comprising:

a document platen having an original placing area on which an original to be copied is placed,

optical scanning means for scanning the original on said document platen and projecting an image of the original, said optical scanning means being capable of changing a projection magnification,

paper selection means for selecting a size of paper on which the image of the original is to be formed,

paper feed means including a plurality of paper feed sections storing paper sheets of different sizes, for feeding paper sheets of the size selected by said paper selection means from the corresponding one of said paper feed sections,

mode selection means for selecting either a normal mode or a division mode, said normal mode being adapted to enable the image of the original on said original placing area to be formed as it is on the paper sheet fed by said paper feed means, and said division mode being adapted to enable said original placing area to be divided into two areas and to enable images of the original on the divided areas to be formed individually on the respective paper sheets fed by said paper feed means,

area entry means for entering an area size defined by the division of said original placing area in said division mode, and

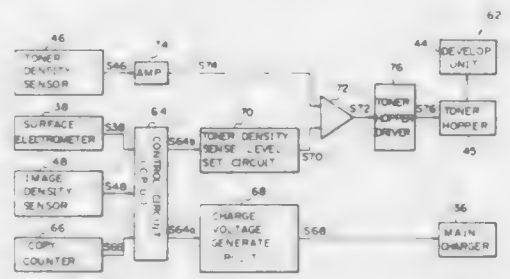


image forming means for automatically calculating, in said division mode, the projection magnification to be set in said optical scanning means based on the paper size selected by said paper selection means and the area size entered by said area entry means, thereby to execute image formation by using the calculated projection magnification.

IMAGE DENSITY CONTROL METHOD FOR AN IMAGE FORMING APPARATUS

Yasushi Koichi, Yamato; Norimasa Sohmiya, Soka, and Kazunori Karasawa, Tokyo, all of Japan, assignors to Ricoh Company, Ltd., Tokyo, Japan

Filed Nov. 6, 1989, Ser. No. 431,826
Claims priority, application Japan, Nov. 8, 1988, 63-280431
Int. Cl.[5] G03G *21/00*
U.S. Cl. 355—246 **9 Claims**

1. A method for controlling a density of an image produced by an image forming apparatus constantly to an adequate density by using an image density sensor responsive to a density of a toner image which is formed on an image carrier of said apparatus by developing a latent image by a developer, and a toner density sensor responsive to a toner density of said developer, said toner density sensed by said toner density sensor being compared with a density sensing level set beforehand for adjusting an amount of toner supply in response to a result of comparison, said method comprising the steps of:

(a) electrostatically forming a latent image of a reference image having a predetermined pattern on the image carrier, and developing said latent image by a toner;

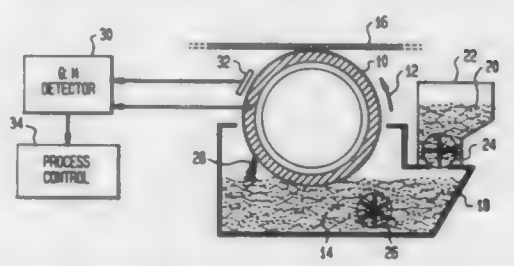
(b) sensing a density of a developed toner image of the reference image by the image density sensor;

(c) changing, when the sensed density of the toner image of the reference image lies in a predetermined controlled range, the density sensing level of the toner density sensor depending on a degree of said sensed density and controlling, when said sensed density does not lie in said predetermined image controllable range, the amount of supply in response to an output of the toner density sensor without changing said density sensing level and by using said density sensing level being used; and

(d) controlling, when the density of the toner image sensed by step (b) lies in an adequate image density range, controlling the supply of toner in response to an output of toner density sensor without changing the density sensing level and by using said density sensing level being used, and executing the step (c) when said density does not lie in said adequate image density range.

5,006,897

DETERMINATION OF CHARGE-TO-MASS RATIO



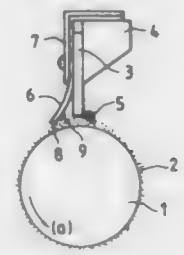
Donald S. Rimai, Webster; Joseph F. Laukaitis; Mark Zaretsky, both of Rochester, and Bruno Primerano, Webster, all of N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.

Filed Jul. 2, 1990, Ser. No. 546,983
Int. Cl.[5] G03G *21/00*
U.S. Cl. 355—246 **11 Claims**

1. Electrostatographic apparatus comprising means for developing a latent electrostatic image by the application of toner particles, said apparatus comprising:

a piezo device having an electrode capacitively coupled to another member and positioned to interact with toner particles used in the apparatus;

means for periodically electrically biasing the electrode to attract toner particles; and



means for detecting the frequency shift of the piezo device due to the mass of attracted toner particles.

5,006,898

DEVELOPING APPARATUS FOR XEROGRAPHY

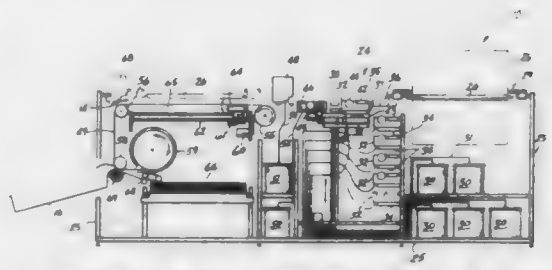
Junji Kobayashi; Hiroyoshi Tokoro; Kiyoshi Niinuma; Kensei Hosoya, and Masao Chiba, all of Ibaraki, Japan, assignors to Hitachi Koki Co., Ltd., Tokyo, Japan

Filed Apr. 14, 1989, Ser. No. 337,872
Claims priority, application Japan, Apr. 15, 1988, 63-94184
Int. Cl.[5] G03G *15/09*
U.S. Cl. 355—253 **2 Claims**

1. A developing apparatus for xerography comprising:

a developing roll;

a regulator member for controlling developer thickness located proximate to said developing roll; and



an elastic plate member arranged to elastically apply pressure, independently of said regulator member, so as to uniformly spread the developer across a length of said developing roll.

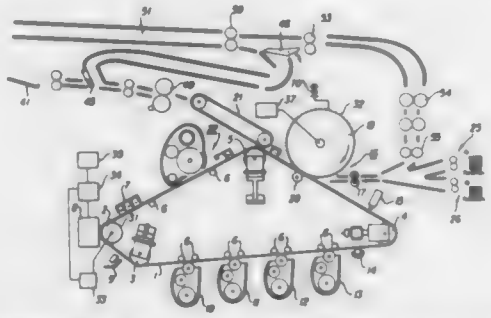
5,006,899

DEVELOPING SYSTEM FOR AN ELECTROPHOTOGRAPHIC MULTICOLOR IMAGING APPARATUS

David P. Bujese, Butler, N.J., assignor to Olin Hunt Specialty Products Inc., Cheshire, Conn.

Filed Sep. 6, 1989, Ser. No. 403,642
Int. Cl.[5] G03G *15/10*
U.S. Cl. 355—256 **36 Claims**

1. A multicolor imaging apparatus having an improved developing system for applying color toner to a charged latent image, comprising in combination:



(a) means for providing the charged latent image:
(b) a plurality of individual developing units each adapted to contain a different color toner for developing the latent image, all of the individual developing units being retained in a first remote storage position, each developing unit being selectively moveable between the first remote storage position and a common second operating position in a processing path adjacent the charged latent image, the second operating position being the same for the plurality of developing units; and
(c) means to selectively transport all of the plurality of developing units between each of the first remote storage positions and the common second operating position.

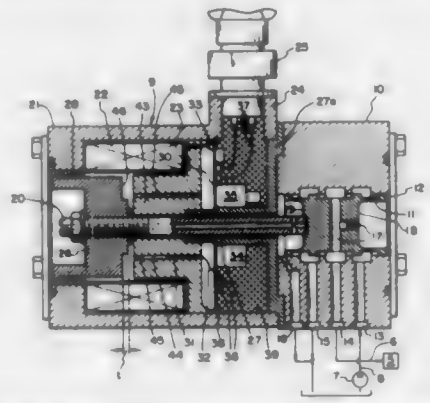
5,006,900

TRANSFER APPARATUS HAVING VACUUM HOLES AND METHOD OF MAKING SUCH APPARATUS

Richard C. Baughman, Geneseo; David J. Ellingham, Rochester; William Y. Fowlkes, Brockport; Bruce J. Rubin, and Frank S. Stepanik, both of Rochester, all of N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.

Filed Jul. 3, 1989, Ser. No. 375,110
Int. Cl.[5] G03G *15/00*
U.S. Cl. 355—271 **10 Claims**

1. Apparatus for transferring a toner image from an image-bearing member to a receiving sheet, said apparatus comprising:
a transfer member having a surface and having vacuum opening means to said surface,
means for applying a vacuum to said vacuum opening means to hold a receiving sheet on the surface of the transfer member, and
means for creating an electric field urging a toner image toward a receiving sheet held on said surface,
characterized in that said vacuum opening means include a line of closely spaced, laser drilled holes, said holes having a diameter at their narrowest point of 0.65 mm or less and being spaced to provide a concentration of at least 4 to a centimeter.



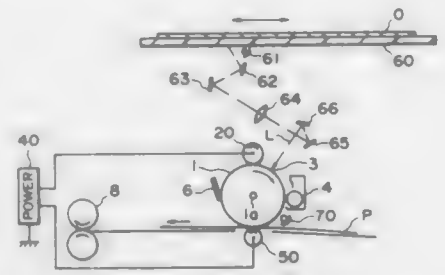
5,006,901

ELECTROMAGNET WITH PLUNGER

Heinrich Dick, Nattheim, Fed. Rep. of Germany, assignor to J. M. Voith GmbH, Heidenheim, Fed. Rep. of Germany

Filed Feb. 14, 1990, Ser. No. 479,623
Claims priority, application Fed. Rep. of Germany, Feb. 18, 1989, 3905023
Int. Cl.[5] H01F *7/08*
U.S. Cl. 335—258 **12 Claims**

1. An electromagnet and plunger assembly comprising:
a plunger,
a fixed essentially ring-shaped solenoid coil,
a fixed pole component extending from one end of said coil into the interior of said coil,
said plunger being movable in an axial direction and extending from the other end of said coil into the interior of said coil,
a control means for adjusting armature pull comprising a sensor means for measuring magnetic flux and thus magnetic induction, and
an annular gap coaxial with said electromagnet which extends through said fixed pole component so that said pole



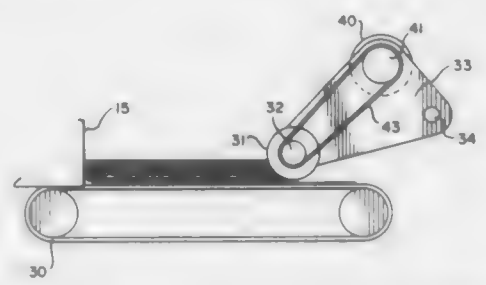
component is subdivided into parts that are magnetically insulated from each other,
said sensor means being located in the annular gap between said two pole component parts.

5,006,902

IMAGE FORMING APPARATUS HAVING A PREDETERMINED VOLTAGE APPLIED TO THE TRANSFER MEMBER

Junji Araya, Yokohama, Japan, assignor to Canon Kabushiki Kaisha, Tokyo, Japan

Filed Jun. 29, 1988, Ser. No. 213,121
Claims priority, application Japan, Jun. 30, 1987, 62-163562
Int. Cl.[5] G03G *15/14, 15/02*
U.S. Cl. 355—271 **28 Claims**



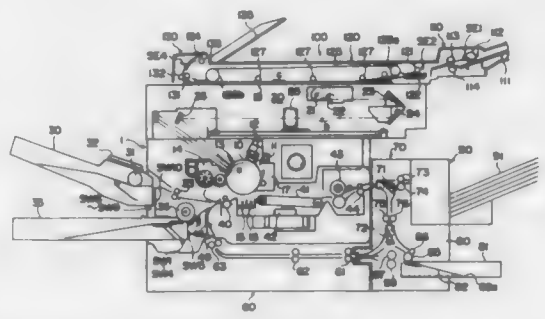
1. An image forming apparatus, comprising:
an image bearing member;
image forming means for forming an image on a surface of said image bearing member; and
transfer means for transferring the image formed on said image bearing member by said image forming means onto an image receiving member, said transfer means including a transfer member contacted to said image bearing member and voltage application means for applying a voltage between the transfer member and the image bearing member to transfer the image from said image bearing member to the image receiving material,
wherein the voltage which is applied between the transfer member and the image bearing member from said voltage application means at least during image transfer action by said image transfer means, is lower than a charge starting voltage of the transfer member between itself and the surface of the image bearing member.

5,006,903

SHEET SEPARATING DEVICE AND APPARATUS FOR USE THEREIN

Floyd E. Stearns, Warsaw, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y.

Filed Oct. 16, 1989, Ser. No. 422,316
Int. Cl.[5] G03G *21/00*
U.S. Cl. 355—308 **8 Claims**



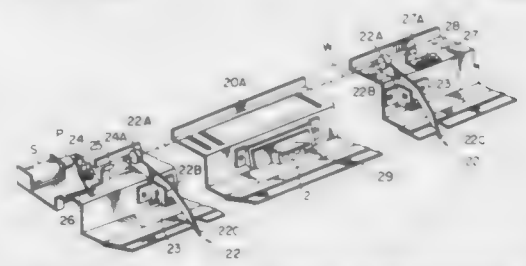
1 A device for separating a sheet from a stack of sheets, said device comprising:
feed means for engaging an outside sheet of said stack and for feeding said outside sheet along a path,
rotatable retard means for forming a nip with said feed means to prevent double feeds of said sheets between said feed means and said retard means, said retard means including
a rotatable retard member,
a brake for said retard member, said brake being adjustable between a first condition in which it exerts a first brake force on said retard member sufficient to prevent rotation of said retard member when two sheets are in said nip but permit rotation when only one sheet is in said nip, and a second condition in which said brake exerts a second brake force that is substantially reduced below the first brake force to facilitate feeding of a single sheet, and
logic and control means having means for adjusting said brake from its first condition to its second condition when only one sheet remains in said stack of sheets.

5,006,904

COPYING APPARATUS PROVIDED WITH AUTOMATIC DOCUMENT FEEDER

Hirokazu Matsuo, and Hiroyasu Nagato, both of Osaka, Japan, assignors to Minolta Camera Kabushiki Kaisha, Osaka, Japan

Continuation of Ser. No. 188,798, Apr. 29, 1988, abandoned.
This application Oct. 30, 1989, Ser. No. 428,413
Claims priority, application Japan, May 1, 1987, 62-108624; May 12, 1987, 62-115336; May 12, 1987, 62-115337; May 12, 1987, 62-115338; May 12, 1987, 62-115339; May 18, 1987, 62-121652
Int. Cl.[5] G03G *21/00*
U.S. Cl. 355—313 **10 Claims**



1. A copying apparatus comprising:
automatic document feeding means capable of operating in a first mode where one original document fed from document feeding means is placed onto a platen, and in a second mode where a pair of original documents fed from said document feeding means are serially placed onto said platen in the document feeding direction;
select means for selecting either the first mode or second mode;
means for feeding copy sheets to an image forming portion;
detect means for detecting the sizes of sheets in said copy sheet feeding means; and
inhibition means for inhibiting the selection of the second mode, when the longer sides of the sheets stored in said sheet feeding means are perpendicular to the sheet transport direction.

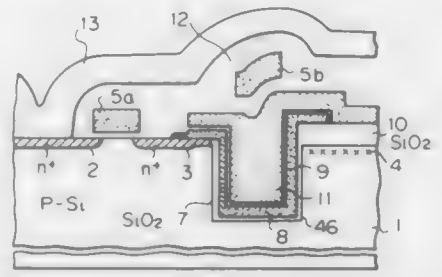
1. A semiconductor memory device, comprising:

a semiconductor substrate having a major surface and a trench with first and second sidewalls formed therein, the first sidewall being in a first plane;

a field oxide layer selectively formed on the major surface of said semiconductor substrate, said field oxide layer having a major surface in a second plane, and a minor surface of said field oxide layer forming a continuation of said first sidewall substantially in the first plane;



an insulating layer formed in the trench, covering said first sidewall and the minor surface of said field oxide layer, and extending to and being substantially flush with the major surface of said semiconductor substrate along said second sidewall; and

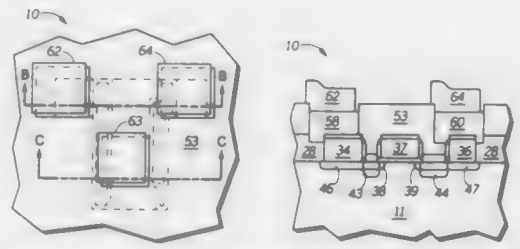
a capacitor comprising:

a conductive layer formed on said insulating layer, a first part of said conductive layer being formed on a part of said major surface of said field oxide layer and a second part of said conductive layer being formed in a third plane lower than the second plane and on the major surface of said substrate so as to cover the portion of said insulating layer that is flush with the major surface of said substrate;

a dielectric layer formed on at least the first and second parts of said conductive layer; and

an electrode formed on said dielectric layer, said electrode having a first portion formed over the second part of said conductive layer.

5,006,911



TRANSISTOR DEVICE WITH HIGH DENSITY CONTACTS

Richard D. Sivan, Austin, Tex., assignor to Motorola, Inc., Schaumburg, Ill.

Filed Oct. 2, 1989, Ser. No. 415,833

Int. Cl.[5] H01L *29/78*

U.S. Cl. 357—23.11 **9 Claims**

1. An integrated circuit device formed in a substrate, comprising:

an active region defined by walls of a field oxide, said active region comprising a stem portion running from a top end to a bottom end, a left branch extending left substantially orthogonally from the stem on a left side of the stem portion, and a right branch extending right substantially orthogonally from the stem portion on a right side of the stem portion;

a conductive strip aligned along an intermediate portion of the stem portion, spaced from the left side and right side of the stem portion, and contained within the stem portion, said strip terminating at the field oxide at the top and bottom ends of the stem portion;

a first doped region in the substrate in the stem portion along the left side of the stem portion and a first side of the conductive strip;

a second doped region in the substrate in the stem portion along the right side of the stem portion and a second side of the conductive strip;

a first raised conductive material overlying and contained within left branch and having a boundary partially defined by a first portion of the field oxide;

a second raised conductive material overlying and contained within the right branch;

an insulating material overlying the active region, said insulating material having a first hole over the first raised conductive material, a second hole over the second raised conductive material, and a third hole over the conductive strip;

a first contact in the first hole which makes electrical contact with the first raised conductive material;

a second contact in the second hole which makes electrical contact with the second raised conductive material; and

a third contact in the third hole which makes electrical contact with the conductive strip.

STACKED TYPE SEMICONDUCTOR DEVICE

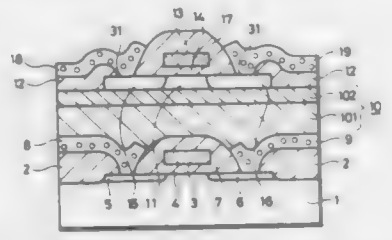
Kazuyuki Sugahara; Shigeru Kusunoki, and Takashi Ipposhi, all of Hyogo, Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Filed Nov. 2, 1989, Ser. No. 430,402

Claims priority, application Japan, Nov. 5, 1988, 63-279631; Jul. 27, 1989, 1-196167

Int. Cl.[5] H01L *27/02, 29/68, 27/12, 29/10*

U.S. Cl. 357—41 **4 Claims**



1. A stacked type semiconductor device, comprising:

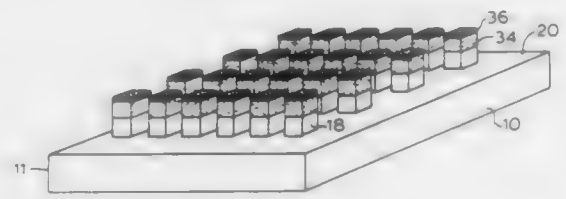
a first semiconductor layer having a main surface on which a first semiconductor element is formed;

an interlayer insulating film having a first insulating layer having a glass transition point of no higher than 750° C. formed on said first semiconductor element and a second insulating layer having a glass transition point higher than

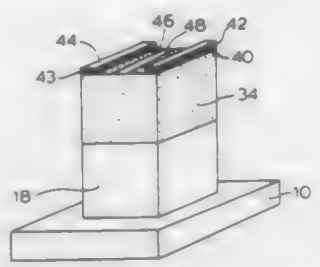
750° C. and a thickness no less than 2000Å and no more than 1 μm formed on said first insulating layer; and

a second semiconductor layer formed on said second insulating layer of said interlayer insulating film with peripheral portions isolated to have an island-like shape, having a main surface on which a second semiconductor element is formed.

5,006,914



SINGLE CRYSTAL SEMICONDUCTOR SUBSTRATE ARTICLES AND SEMICONDUCTOR DEVICES COMPRISING SAME



Charles P. Beetz, Jr., New Milford, Conn., assignor to Advanced Technology Materials, Inc., New Milford, Conn.

Filed Dec. 2, 1988, Ser. No. 278,964

Int. Cl.[5] **H01L** *29/161, 29/20, 29/22, 29/24*

U.S. Cl. 357—61 **17 Claims**

1. A textured substrate article, comprising:

a single crystal base of a selected crystalline material, including a generally planar primary surface and a regular periodic array of posts integrally extending from the primary surface and terminating in top surfaces; and

a single crystal epitaxial layer of a selected crystalline material deposited on the top surfaces of the posts, the single crystal epitaxial layer being selectively doped with a deposit component imparting semiconductor properties to the epitaxial layer;

the crystalline lattice constants for the base single crystal material and the epitaxial layer single crystal material being within 10% of one another;

the single crystal material of the epitaxial layer being selected from the group consisting of diamond, cubic boron nitride, boron phosphide, beta-silicon carbide, and gallium nitride;

the posts having a height of from about 0.5 to about 10 micrometers, and a cross-section dimensional characteristic of from about 0.5 to 20 micrometers; and

the spacing between adjacent posts being from about 2 to about 5 micrometers, as measured between adjacent facing surfaces of the posts.

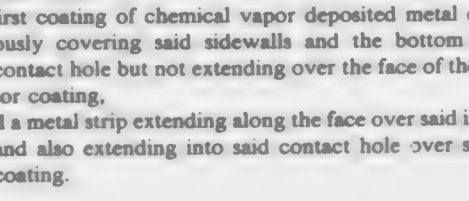
ELECTRIC DEVICE AND PHOTOELECTRIC CONVERSION DEVICE COMPRISING THE SAME



Masao Yoshikawa, and Tetsuro Suzuki, both of Yokohama, Japan, assignors to Ricoh Company, Ltd., Tokyo, Japan

Filed Feb. 9, 1990, Ser. No. 477,484

Claims priority, application Japan, Feb. 14, 1989, 1-32798; Jun. 6, 1989, 1-142081

Int. Cl.[5] **H01L** *29/28, 23/54*

U.S. Cl. 357—61 **12 Claims**

1. A photoelectric conversion device comprising:

(a) a first electrode,

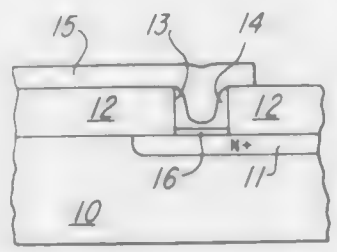
(b) an n-type inorganic semiconductor layer formed on said electrode,

(c) an electron-conductive organic layer formed on said n-type inorganic semiconductor layer, which serves as an electron acceptor layer,

(d) an electron donor layer, and

(e) a second electrode, which are successively overlaid, and at least one electrode of said first electrode or said second electrode is transparent to employed light.

5,006,916



VERTICAL-WALLED CONTACTS FOR VLSI SEMICONDUCTOR DEVICES

Kendall S. Wills, Houston, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex.

Division of Ser. No. 630,471, Jul. 11, 1984, Pat. No. 4,720,908. This application Aug. 3, 1987, Ser. No. 82,718

Int. Cl.[5] **H01L** *23/54, 23/48*

U.S. Cl. 357—67 **5 Claims**

1. A semiconductor device comprising:

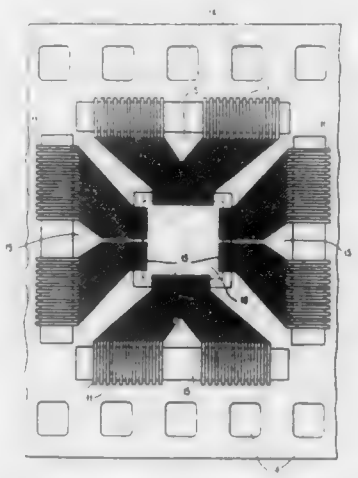
a region in a face of a semiconductor body,

an insulator coating on said face having a contact hole over said region, said contact hole having substantially vertical sidewalls,

a first coating of chemical vapor deposited metal continuously covering said sidewalls and the bottom of said contact hole but not extending over the face of the insulator coating,

and a metal strip extending along the face over said insulator and also extending into said contact hole over said first coating.

5,006,917



THERMOCOMPRESSION BONDING IN INTEGRATED CIRCUIT PACKAGING

Sung K. Kang, Chappaqua; Michael J. Palmer, Walden, both of N.Y.; Timothy C. Reiley, Los Gatos, Calif., and Robert D. Topa, Binghamton, N.Y., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Aug. 25, 1989, Ser. No. 398,799

Int. Cl.[5] **H01L** *23/48, 23/54*

U.S. Cl. 357—70 **10 Claims**

1. An integrated circuit packaging structure comprising in combination

a central aperture in at least one insulating member supporting at least one electrical conductor,

at least one beam lead end on said at least one electrical conductor,

each said beam lead end being cantilevered into said aperture,

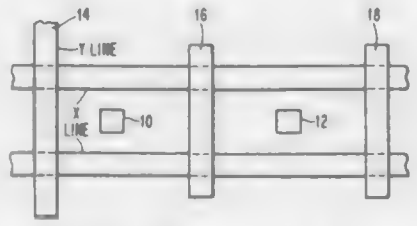
each said beam lead end having a deformable uniform consistency layer of metal taken from the group of Au, Pd, Pt, Ag, Ir and Ni,

said deformable layer having

a hardness on the Knoop scale in the range of that of soft Au which is approximately 90, and

a surface morphology of ridges having a spacing of approximately ½ the combination of said conductor and a pad to which said conductor is bonded, and with a depth between ridges of from about ¼ to ½ the thickness of said pad.

5,006,918



FLOATING ORTHOGONAL LINE STRUCTURE FOR X-Y WIRING PLANES

Alina Deutsch, Mount Kisco, and Barry J. Rubin, Croton-on-Hudson, both of N.Y., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Jul. 24, 1989, Ser. No. 383,516

Int. Cl.[5] **H01L** *23/48, 29/46, 29/54*

U.S. Cl. 357—71 **1 Claim**

1. In an integrated circuit structure of the type having printed circuit wiring lines disposed on integrated circuit chips, a wiring configuration for reducing noise in the integrated circuit comprising:

at least one pair of parallel, adjacent, electrically conductive integrated circuit X-lines disposed on an integrated circuit chip said parallel adjacent electrically conductive integrated circuit lines being separated by a pitch distance d and being capacitively coupled and inductively coupled to each other wherein the difference between said capacitively and inductively coupled conductive lines produce a far end noise factor,

at least one additional integrated circuit conductive Y-line disposed orthogonally across said at least one pair of parallel electrically conductive X-lines, said at least one additional conductive X-lines functioning to reduce said capacitive and inductive coupling of said parallel adjacent conductive X-lines wherein the amount of said capacitive coupling reduction is relatively greater than the amount of said inductive coupling reduction, thereby increasing the far-end noise factor of said parallel adjacent conduction X-lines, and

at least one non-grounded conductive line of length 2d disposed orthogonally across and capacitively coupled to said at least one pair of parallel adjacent conductive X-lines for increasing the amount of said capacitive coupling of said parallel adjacent conductive X-lines to reduce the amount of said far-end noise factor,

a second integrated circuit chip disposed above said pair of parallel, adjacent, electrically conductive integrated circuit lines, said integrated circuit chip and said second integrated circuit chip being reference planes,

wherein said X-lines provide a capacitance relative to said reference planes designated C_x, wherein said Y-line disposed orthogonally across said at least one pair of X-lines provides an overlap capacitance of C_{xy}, wherein C_{12} is the coupling capacitance between said parallel X-lines, and the capacitance of said non-grounded orthogonally disposed line relative to said reference planes in $C_y = 2C_x$ and,

wherein said C_{12} coupling capacitance between said parallel X-lines is increased in value to an amount $C_{12} + \frac{1}{4}$ by said non-grounded orthogonally disposed line.

INTEGRATED CIRCUIT PACKAGE

David Disko, Austin, Tex., assignor to Advanced Micro Devices, Inc., Sunnyvale, Calif.

Filed Mar. 1, 1990, Ser. No. 487,600

Int. Cl.[5] **H01L** *23/28, 23/48, 29/44, 29/52*

U.S. Cl. 357—72 **10 Claims**

1. An integrated circuit package assembly for housing an integrated circuit die of the type having a substantially planar bottom surface, a substantially planar top surface, and a plurality of connection pads disposed on said top surface, wherein said connection pads include at least one ground connection pad, said integrated circuit package assembly affording substantially reduced ground bounce within said integrated circuit and comprising:

a sheet of substantially planar electrically conductive material;

electrically insulating bonding means for bonding said integrated circuit die bottom surface directly to said sheet of electrically conductive material;

a plurality of electrically conductive leads extending laterally from said integrated circuit die, said leads including at least one ground lead and a plurality of non-ground conductive leads;

first bond wire means connecting said integrated circuit die ground connection pad to said sheet of electrically conductive material;

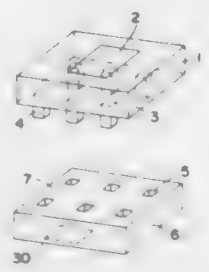
second bond wire means connecting said sheet of electrically conductive material to said ground lead;

third bond wire means connecting said non-ground connection pads to said non-ground conductive leads; and

encapsulation means for encapsulating said integrated circuit die, said sheet of electrically conductive material, said first, second and third bond wire means, and a portion of each said electrically conductive leads, said encapsulation means being formed from electrically insulating material and being immediately adjacent said sheet of electrically conductive material.

5,006,920

ELECTRICAL COMPONENTS



Wolfgang Schafer, Bad Vilbel, and Hans Isert, Rodermark, both of Fed. Rep. of Germany, assignors to Telenorma Telefonbau und Normalzeit GmbH, Frankfurt am Main, Fed. Rep. of Germany

Filed Mar. 16, 1988, Ser. No. 168,698

Claims priority, application Fed. Rep. of Germany, Mar. 18, 1987, 3708789; Oct. 20, 1987, 3735455

Int. Cl.[5] H01L *23/02, 23/12*

U.S. Cl. 357—74 **9 Claims**

1. In combination,

a first modular micro-electronic unit comprising

a first substrate,

a first electronic circuit incorporated at a first major surface of said first substrate, and

first etched mechanical mating means formed integrally with said first substrate at a second major surface of said first substrate oppositely disposed from said first major surface, and

a second modular micro-electronic unit comprising a second substrate and second etched mechanical mating means formed on a major surface of said second substrate,

said first and second mechanical mating means mating with each other to form a mechanical bond between said first and second modular micro-electronic units,

wherein said first and second mating means include an electrically conducting material, said first and second mating means mating together to form both an electrical bond and a mechanical bond between said first and second micro-electronic units.

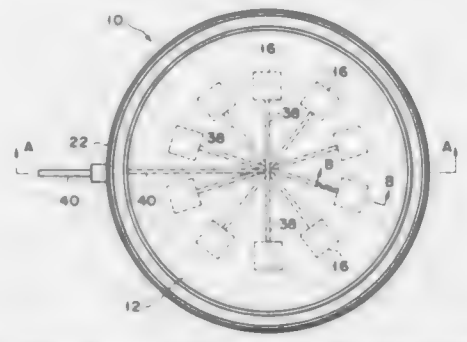
POWER SEMICONDUCTOR SWITCHING APPARATUS WITH HEAT SINKS



Masaru Ishizuka, Kawasaki; Yasuyuki Yokono, Tokyo; Asako Matsuura, Yokohama; Yoshio Kamei, Yoshikawa; Hiromichi Ohashi, Yokohama; Mitsuhiko Kitagawa, Tokyo; Tomiya Sasaki, both of Tokyo, and Shigeki Moana, Yokohama, all of Japan, assignors to Kabushiki Kaisha Toshiba, Kawasaki, Japan

Filed Mar. 31, 1989, Ser. No. 331,288

Claims priority, application Japan, Mar. 31, 1988, 63-76083; Mar. 31, 1988, 63-78977; Aug. 31, 1988, 63-214862; Sep. 30, 1988, 63-243813

Int. Cl.[5] H01L *23/42*

U.S. Cl. 357—74 **77 Claims**

1. A power semiconductor switching apparatus comprising:

an anode electrode serving as a heat sink;

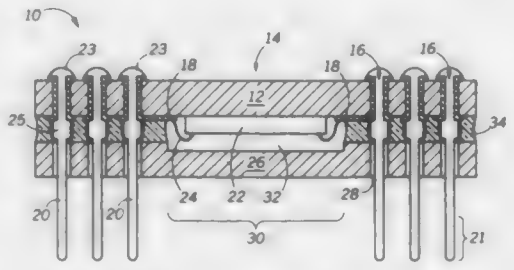
a cathode electrode serving as a heat sink;

a plurality of parallel semiconductor switching element chips arranged between said anode and cathode electrodes, the number of said semiconductor switching element chips being set such that a total of rated currents flowing through the chips becomes equal to or larger than a rated current of said switching apparatus;

a plurality of gate electrode wires connected to each of said chips and

reducing and conducting means for reducing a thermal stress induced in said semiconductor switching element chips and for conducting heat from surfaces of said chips to said anode and cathode electrodes, said reducing and conducting means being located around said chips.

5,006,922



PACKAGED SEMICONDUCTOR DEVICE HAVING A LOW COST CERAMIC PGA PACKAGE

Michael B. McShane; Paul T. Lin, and Howard P. Wilson, all of Austin, Tex., assignors to Motorola, Inc., Schaumburg, Ill.

Filed Feb. 14, 1990, Ser. No. 480,386

Int. Cl.[5] H01L *23/50, 23/04*

U.S. Cl. 357—74 **22 Claims**

1. A packaged semiconductor device comprising:

a single-layer ceramic base having a first plurality of through-holes therein;

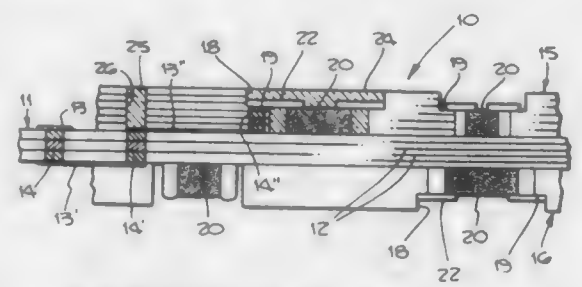
an integrated circuit disposed at a predetermined location on said base;

terminal means attached to said base extending through said first plurality of through-holes in said base and having distal ends extending therefrom, said terminal means providing external electrical connection to said semiconductor device;

a cap substantially co-extensive with said base having a second plurality of through-holes therein corresponding with and aligned to said first plurality of through-holes in said base, said cap bonded to said base forming a cavity between said base and said cap hermetically enclosing said integrated circuit within said cavity; and

coupling means for electrically coupling said terminal means to said integrated circuit.

5,006,923



STACKABLE MULTILAYER SUBSTRATE FOR MOUNTING INTEGRATED CIRCUITS

Keith O. Warren, Newbury Park, Calif., assignor to Litton Systems, Inc., Woodland Hills, Calif.

Filed Sep. 14, 1989, Ser. No. 407,045

Int. Cl.[5] H01L *39/02, 23/16, 23/02, 23/12*

U.S. Cl. 357—80 **20 Claims**

1. A substrate for mounting integrated circuits in a multistack configuration wherein said circuits are insensitive to acceleration forces, comprising:

a first substrate of a plurality of insulated layers;

a second substrate of a plurality of insulated layers each having apertures therein which are aligned to form integrated circuit receiving apertures;

said first and second substrates formed into a single, rigid multilayer board;

integrated circuits mounted within said integrated circuit receiving apertures in said rigid multilayer board;

a layer of insulating material different from the material of said insulating layers placed at least partially over said integrated circuits and at least partially filling said integrated circuit receiving apertures;

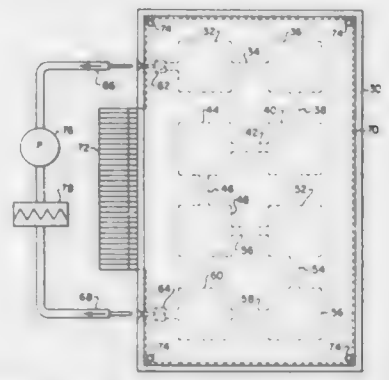
said layer of insulating material formed into a rigid surface over said integrated circuits on said multilayer board to mount said circuits rigidly upon said multilayer board to be insensitive to acceleration forces;

said layer of insulating material further covering said rigid multilayer board;

a plurality of said rigid multilayer boards covered by said layers of insulating material stacked together into a multistack of said boards; and

said layers of insulating material bonding said plurality of said rigid multilayer boards into one multistack as said layers form said rigid surface over said integrated circuits to mount said circuits in said multistack configuration.

5,006,924



HEAT SINK FOR UTILIZATION WITH HIGH DENSITY INTEGRATED CIRCUIT SUBSTRATES

Richard F. Frankeny, Elgin, and Karl Hermann, Austin, both of Tex., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Dec. 29, 1989, Ser. No. 459,089

Int. Cl.[5] H01L *25/04, 23/16, 23/02;* **H02B** *1/00*

U.S. Cl. 357—82 **6 Claims**

1. A heat sink system for use with multiple integrated circuit devices mounted in a planar configuration upon a circuit substrate having an electrical connector disposed along one edge thereof, said heat sink system comprising:

a rigid thermally conductive substrate mounted in fixed relationship adjacent to said circuit membrane;

a plurality of serially interconnected compliant bags mounted to said rigid thermally conductive substrate, each of said plurality of serially interconnected compliant bags mounted in a mated relationship with one of said multiple integrated circuit devices;

an input valve mounted in fixed relationship with a first of said plurality of serially interconnected compliant bags for coupling thermally conductive fluid into said first compliant bag;

an output valve mounted in fixed relationship with a second of said plurality of serially interconnected bags for coupling thermally conductive fluid out of said second complaint bag; and

a source of pressurized thermally conductive fluid having an input connector and an output connector mounted in fixed relationship with an appropriate electrical receptacle wherein connection of said electrical connector of said circuit substrate to said appropriate electrical connector will couple said input connector to said input valve and said output connector to said output valve whereby said heat sink system will be automatically actuated.

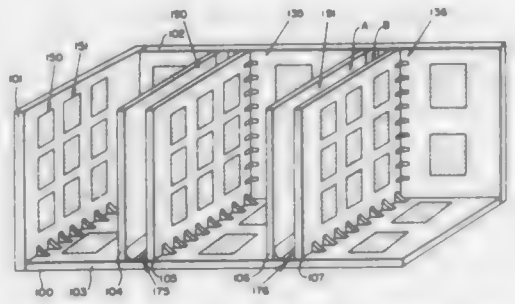
THREE DIMENSIONAL MICROELECTRIC PACKAGING

Mark F. Bregman, Ridgefield, Conn.; Raymond R. Horton, Dover Plains, N.Y.; Ismail C. Noyan, Peekskill, N.Y., and Michael J. Palmer, Walden, N.Y., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Nov. 22, 1989, Ser. No. 440,180

Int. Cl.[5] H01L *23/16, 23/44;* **H05K** *7/14*



U.S. Cl. 357—82 **9 Claims**

1. A three-dimensional chip package comprising:

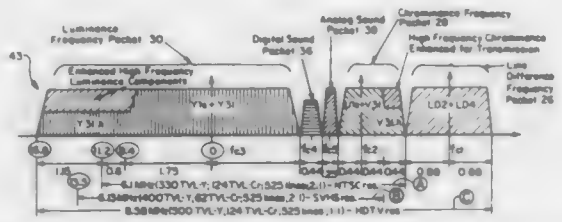
(a) A plurality of semiconductor substrates, each having at least one semiconductor electronic device mounted thereon, wherein at least a subset of said plurality of semiconductor substrates are joined together to form an enclosure for housing the mounted semiconductor electronic devices;

(b)) means for forming an electrical contact between at least two of said plurality of substrates; and

(c) channel means, for providing at least one cooling channel within said enclosure into which a cooling fluid may be

introduced, wherein at least a part of said at least one cooling channel is formed by positioning at least two semiconductor substrate surfaces to form channel walls.

5,006,926



HIGH DEFINITION MULTIPLE ANALOG COMPONENT AMPLITUDE MODULATED TELEVISION TRANSMISSION SYSTEM

Mikhail Tsinberg, Riverdale, N.Y., assignor to North American Philips Corporation, New York, N.Y.

Filed Oct. 3, 1988, Ser. No. 252,954

Int. Cl.[5] H04N *11/00, 11/02, 11/14*

U.S. Cl. 358—12 **16 Claims**

1. A method for forming a frequency multiplexed television signal, comprising the steps of:

(a) deriving from a first television signal, a pair of luminance signals, a pair of chrominance signals and a pair of line differential signals;

(b) time expanding each of said luminance, line differential and chrominance signals so as to form a plurality of signal components;

(d) quadrature modulating a first pair of said signal components on a first subcarrier forming a first frequency packet;

(e) quadrature modulating a second pair of said signal components on a second subcarrier forming a second frequency packet;

quadrature modulating a third pair of said signal components on a third subcarrier forming a third frequency packet; and

(f) combining said first, second and third frequency packets to generate said frequency multiplexed signal.

IMAGE PROCESSING METHOD IN AN ELECTRONIC VIDEO ENDOSCOPY SYSTEM

Kazuhiro Kawajiri; Takashi Miida, both of Minami, and Kiyoshi Inoue, Omiya, all of Japan, assignors to Fuji Photo Film Co., Ltd., Kanagawa, Japan

Filed Nov. 30, 1989, Ser. No. 443,481

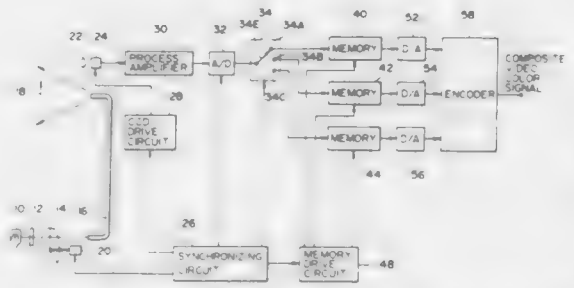
Claims priority, application Japan, Dec. 5, 1988, 63-307463; Dec. 5, 1988, 63-307464

Int. Cl.[5] A61B *1/04, 1/06;* **H04N** *9/07, 11/22*

U.S. Cl. 358—98 **17 Claims**

1. An image processing method for use in an electronic video endoscopy system comprising the steps of:

reading analog R, G, and B surface sequential color signals from a CCD disposed in a leading end portion of an endoscope;



converting said analog R, G, and B surface sequential color signals to respective digital R, G, and B surface sequential color signals;

sequentially storing said digital R, G, and B surface sequential color signals in respective memories according to color; and

reading said stored digital R, G, and B surface sequential color signals simultaneously to convert said read-out stored digital R, G, and B surface sequential color signals into synchronous color signals,

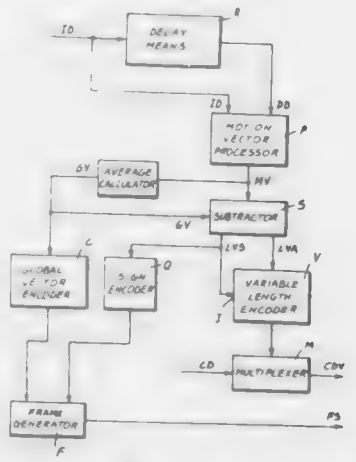
odd and even field data of said CCD are interline transferred

sequentially within a field period to obtain said analog R, G, and B surface sequential color signals and corresponding odd and even field data for each of horizontal scanning

lines stored in said respective memories as said stored digital R, G, and B surface sequential color signals are read alternately therefrom to provide said synchronous color signals.

5,006,929

METHOD FOR ENCODING AND TRANSMITTING VIDEO SIGNALS AS OVERALL MOTION VECTORS AND LOCAL MOTION VECTORS



Marzio Barbero; Mario Muratori, and Mario Stroppiana, all of Turin, Italy, assignors to Rai Radiotelevisione Italiana, Turin, Italy

Filed Mar. 6, 1990, Ser. No. 489,446

Claims priority, application European Pat. Off., Sep. 25, 1989, 89830414.2

Int. Cl.[5] H04N *7/12*

U.S. Cl. 358—105 **9 Claims**

1. A method for encoding and transmitting a video signal representing a succession of images, each image being subdivided into a number of pixel blocks and a motion vector being associated with each block, the method comprising the following steps:

(a) processing the video signal with a redundancy reduction algorithm;

(b) encoding the processed video signal pixel block by pixel block;

(c) grouping the pixel blocks of each image into at least one array of pixel blocks;

(d) generating an overall motion vector for each array of pixel blocks in each image;

(e) subtracting the motion vectors associated with the pixel blocks from the respective overall motion vector to obtain corresponding local motion vectors representing the difference with respect to the respective overall motion vector;

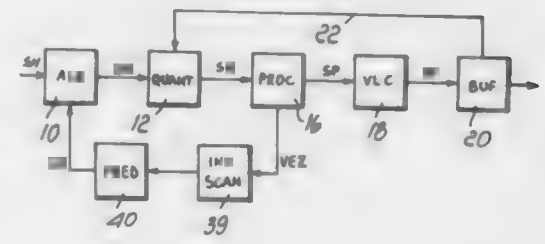
(f) encoding the overall motion vector with fixed length, and

encoding the local motion vectors with variable length, to obtain respective coded motion vectors; and

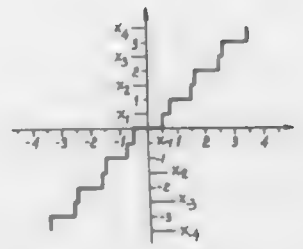
(g) multiplexing both the coded overall vector and the coded local vectors into a transmitted signal.

5,006,930

DEVICE FOR REDUCING THE REDUNDANCY IN BLOCKS OF DIGITAL VIDEO DATA IN DCT ENCODING



Mario Stroppiana, Turin, and Luigi Ronchetti, Como, both of Italy, assignors to RAI Radiotelevisioni Italiano, S.p.A., Italy

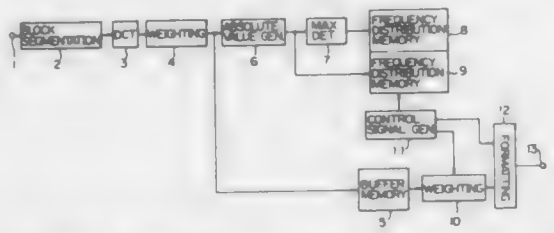


Filed Mar. 6, 1990, Ser. No. 489,485

Claims priority, application European Pat. Off., Jul. 4, 1989, 89830311.0

Int. Cl.[5] H04N *7/13*

U.S. Cl. 358—133 **6 Claims**



1. An improved device for DCT encoding, quantization and variable-word-length encoding of digital video signals with a reduction of redundancy of the video signal, comprising a converter which processes a digital video signal according to a redundancy-reducing algorithm operating on successive blocks of each frame or field and generates a transformed signal which is applied to a quantizer adapted to generate a quantized signal at preset transition levels on opposite sides of zero, including the zero (. . . , −3, −2, 0, 1, 2, 3, . . .), which is processed by a processor, adapted to determine the block length and the consecutive zero sequences along a preset scanning order, and adapted to output a symbolic signal, constituted by symbols designating the quantization levels of the non-null data, the zero sequences and a symbol designating the end of the block, the symbolic signal being applied to a variable-length encoder, adapted to encode data according to a preset assignment rule for generating a signal which is applied to a transmission buffer; said quantized signal generated by the quantizer further comprising two ambiguous levels (x1 and x − 1) at input values comprised in respective preset intermediate ranges respectively between the zero level and the first positive level and between the zero level and the first negative level, said processor transforming each of said ambiguous levels respectively into a first positive level and a first negative level if the preceding and subsequent input values are both non-null and non-ambiguous levels, and transforms the ambiguous level into zero level in all the other cases.

5,006,931

HIGHLY EFFICIENT CODING APPARATUS

Norihisa Shirota, Kanagawa, Japan, assignor to Sony Corporation, Tokyo, Japan

Filed Feb. 20, 1990, Ser. No. 482,252
Claims priority, application Japan, Feb. 28, 1989, 1-46971
Int. Cl.[5] H04N 7/133
U.S. Cl. 358—133 4 Claims

1. A highly efficient coding apparatus for encoding received digital video data in block format and compressing said digital video data when required so that the total bit rate of said digital video data to be transmitted is less than a predetermined transmission bit rate capacity, comprising:

block segmentation means receiving said digital video data and for generating data in said block format,

orthogonal transformation means receiving the block formatted data and for generating coefficient data having a direct current (DC) data component and a plurality of alternating current (AC) data components each having a respective number of bits for each block,

first generating means for generating a first distribution table from the AC coefficient data components during a predetermined period,

second generating means for generating an accumulating distribution table from said first distribution table,

control means for controlling the total bit number of said AC coefficient data components generated during each said predetermined period in response to said accumulating distribution table and said predetermined transmission bit rate capacity, and

data transmitting means having said predetermined transmission bit rate capacity for transmitting said DC coefficient data component, the controlled AC coefficient data components and an additional code in each said predetermined period.

5,006,932

APPARATUS FOR PROCESSING A VIDEO SIGNAL

Michael J. Bergstrom, Carshacton, and Ajaib Hussain, Clapham, both of England, assignors to U.S. Philips Corporation, New York, N.Y.

Filed Apr. 21, 1989, Ser. No. 342,255
Claims priority, application United Kingdom, Apr. 25, 1988, 8809749
Int. Cl.[5] H04N 5/14, 5/04, 9/79
U.S. Cl. 358—160 13 Claims

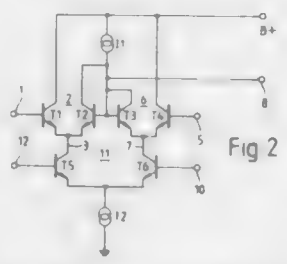


Fig 2

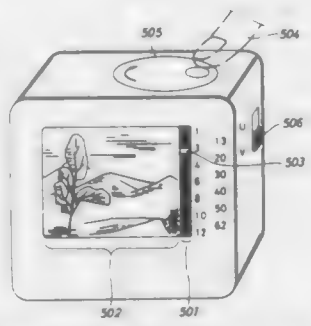
1. An apparatus for processing a composite video signal substantially all of the lines of which each comprise a line synchronising pulse, a front and a back porch and a vision portion, said apparatus comprising:

(a) a first input terminal for receiving said composite video signal and a second input terminal for receiving a reference voltage;

(b) a first signal path comprising a first transistor whose base is connected to said first input terminal and whose emitter is connected through a first unidirectional device to a first signal path output, and first enabling means for enabling said first signal path outside the period of the synchronising pulse in each line period, said first enabling means comprising a first switching circuit connected to the junction between said first transistor and said first unidirectional device;

(c) a second signal path comprising a second transistor whose base is connected to said second input terminal and whose emitter is connected through a second unidirectional device to a second signal path output, and second enabling means for enabling said second signal path during the period of the synchronising pulse in each line period, said second enabling means comprising a second switching circuit connected to the junction between said second transistor and said second unidirectional device; and



(d) means for connecting said first and second signal path outputs to an output terminal for providing a composite video signal whose magnitude during the line synchronising pulse periods is determined by said reference voltage.

LIQUID CRYSTAL TELEVISION

Fuminori Suzuki, Sayama, and Heihachiro Ebihara, Tokorozawa, both of Japan, assignors to Citizen Watch Co., Ltd., Japan

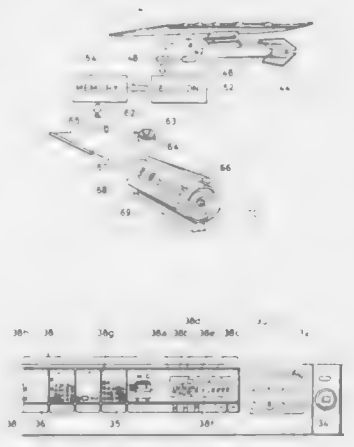
Filed Aug. 29, 1989, Ser. No. 400,301
Claims priority, application Japan, Aug. 30, 1988, 63-213755
Int. Cl.[5] H04N 5/440, 5/50
U.S. Cl. 358—236 8 Claims

1. In a liquid crystal television including a television receiver for receiving a television broadcast signal and outputting a video signal, a tuning voltage control unit for outputting a tuning voltage for said television receiver, and a liquid crystal display unit having a liquid crystal panel, said liquid crystal panel being arranged to simultaneously display a broadcast image and channel mark, comprising:

a plurality of common electrodes;

a plurality of segment electrodes divided into image segment electrodes and indicator segment electrodes;

an image segment driver for receiving the video signal from said television receiver and driving said image segment electrodes according to a first voltage waveform; and



an indicator segment driver for receiving the tuning voltage from said tuning voltage control unit and driving said indicator segment electrodes according to a second voltage waveform different from that of said first voltage waveform.

COPYING MACHINE CAPABLE OF STORING IMAGE DATA

Kaoru Hashimoto, Hyogo; Toshikazu Kawaguchi, and Hirofumi Hasegawa, both of Osaka, all of Japan, assignors to Minolta Camera Kabushiki Kaisha, Osaka, Japan

Continuation of Ser. No. 304,226, Jan. 31, 1989, abandoned. This application Jan. 26, 1990, Ser. No. 469,690
Claims priority, application Japan, Feb. 1, 1988, 63-21647
Int. Cl.[5] G03G 15/00
U.S. Cl. 358—296 9 Claims

1. A copying machine, comprising:

a platen on which an original is placed;

image reading means having a one-dimensional image sensor and scanning means for reading images of the original placed on said platen;

memory means for storing image data corresponding to the images read by said image reading means;

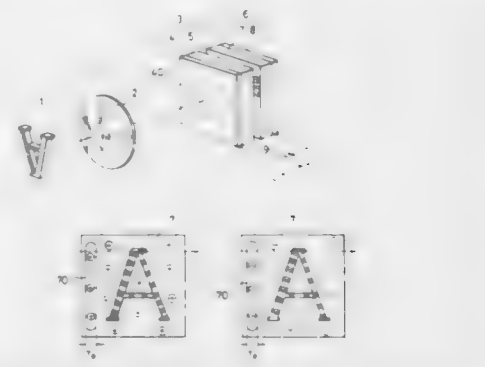
image forming means for forming images based on the image data stored by said memory means;

first indicating means for indicating that said image reading means is carrying out reading operation, and

second indicating means for indicating that said image forming means is carrying out image forming operation.

5,006,935

CHARGE LATENT IMAGE RECORDING REPRODUCING SYSTEM WITH A UNIFORMLY CHARGE DETECTION REGION PROVIDING A REFERENCE INTENSITY OF A RECORDED OBJECT



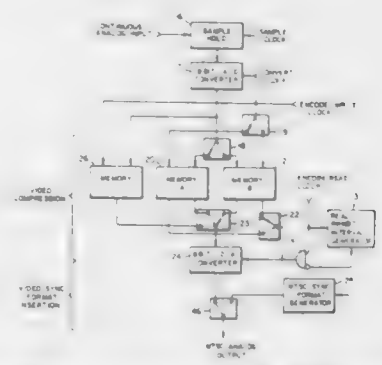
Itsuo Takanashi, Kamakura; Shintaro Nakagaki, Fujisawa, and Hirohiko Shinonaga, Yokohama, all of Japan, assignors to Victor Company of Japan, Ltd., Yokohama, Japan

Filed Sep. 26, 1989, Ser. No. 412,310
Claims priority, application Japan, Sep. 26, 1988, 63-240294; Mar. 24, 1989, 63-72162; Mar. 24, 1989, 63-72635; Mar. 24, 1989, 63-72636
Int. Cl.[5] H04N 1/29
U.S. Cl. 358—300 12 Claims

1. A recording/reproducing system for recording and/or reproducing a charge latent image onto/from a recording medium, comprising

an optical system for directing along a path of an electromagnetic radio ray from an object toward said medium, and

recording means disposed in the path for generating said charge latent image in said medium in response to the electromagnetic radio ray from the object, said recording means comprising charge causing means for detection an uniform charge in a detection region of the recording



medium, said uniform charge in a detection region corresponding to a reference intensity of the object.

5,006,936

METHOD AND SYSTEM FOR HIGH DENSITY ANALOG DATA STORAGE RETRIEVAL, AND TRANSMISSION

John T. Hooks, Jr., Dallas, Tex., assignor to LTV Aerospace and Defense Company, Grand Prairie, Tex.

Continuation of Ser. No. 802,293, Nov. 27, 1985, abandoned, which is a continuation of Ser. No. 610,554, Aug. 13, 1984, abandoned. This application Nov. 2, 1988, Ser. No. 268,614
Int. Cl.[5] H04N 5/76
U.S. Cl. 358—335 15 Claims

1. A bulk analog data storage system comprising:

(a) first means for receiving a continuous analog video input signal;

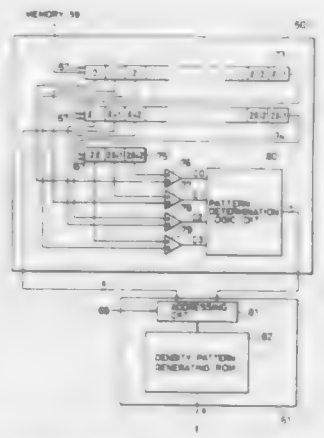
(b) first sample and hold means coupled to said receiving means for sampling said input data at a first clock rate;

(c) first analog-to-digital converter means for converting each of said samples to a digital code;

(d) first and second digital memory means;

(e) first gating means coupled to said first and second memory means for alternately providing digital coded samples of said input data to said first and second memory means;

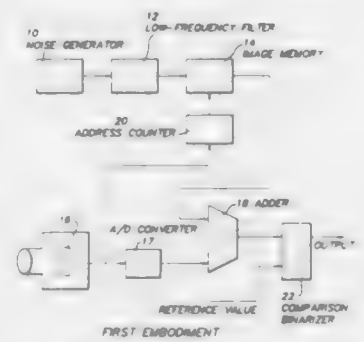
(f) first clock means coupled to said first sample and hold means and to said first and second memory means for clocking said memory means at said first clock rate when data is being written into said memory means;



(g) second gating means coupled to said first and second memory means for multiplexing the digital coded samples of said input data as such data is alternately read from said memory means;

(h) second clocking means for clocking said first and second memory at a second clock rate which is of a higher frequency than said first clock rate;

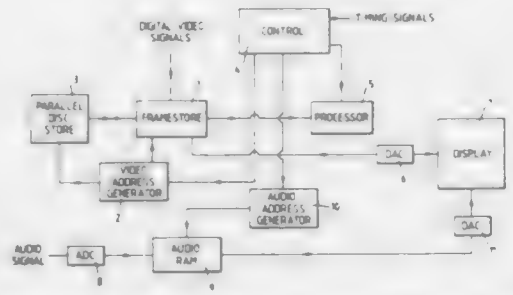
(i) first digital-to-analog converter means for converting the digital coded samples as they are read from said second gating means into an analog formatted signal;



(j) first interval generator means for generating intervals of duration of a sync/blanking pulse for a selected video format, said intervals being at a repetition rate much lower than said first and second clock rates;
(k) third gating means coupled to said first interval generator and to said second clocking means for inhibiting said second clocking signal to the memory means selected by said second gating means during the generated interval, said inhibiting being for a limited period of time so that the inhibiting of the second clocking signal does not result in overwriting of data in said memory means before said data is read from a memory means;
(l) a sync/blanking format generator for generating sync/-blanking pulses for said selected video format;
(m) fourth gating means coupled to said first digital-to-analog converter means and to said sync/blanking format generator for multiplexing the analog formatted signal and the sync/blanking interval into a video signal of said selected video format; and
(n) recorder means for recording said video signals in said selected video format.

5,006,937
IMAGING DATA PROCESSING APPARATUS
Hiroshi Nonoshita, Yokohama, and Seiji Saito, Yokosuka, both of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan
Continuation of Ser. No. 357,677, May 26, 1989, abandoned, which is a division of Ser. No. 937,334, Dec. 3, 1986, abandoned. This application Jul. 27, 1990, Ser. No. 560,294
Claims priority, application Japan, Dec. 6, 1985, 60-273468; Dec. 6, 1985, 60-273469; Dec. 25, 1985, 60-290351; Dec. 25, 1985, 60-290352
Int. Cl.[5] H04N *1/23*
U.S. Cl. 358—456 **12 Claims**

1. Image processing apparatus comprising:
input means for inputting an analog video signal;
first conversion means for converting the input analog video signal into multi-value data;
memory means for storing the multi-value data; and
second conversion means for converting the multi-value data stored in said memory means to binary data when executing its conversion process, wherein said second conversion means (1) detects a density gradient by comparing the multi-value data of pixels around a pixel to be converted with each other in each of vertical, lateral, and oblique directions, and (2) selects a multi-bit image pattern from a plurality of image patterns, in response to the detected density gradient.



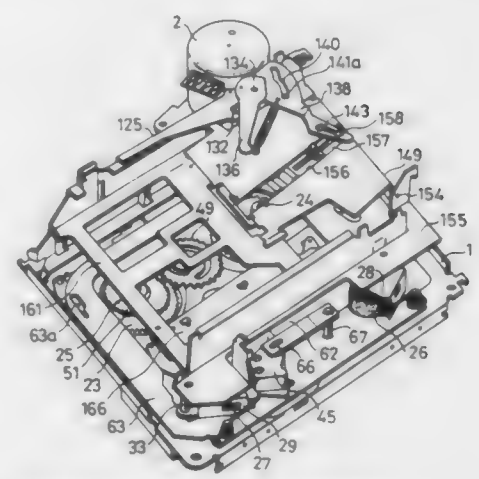
5,006,938
HALF-TONE IMAGE GENERATOR USING WHITE NOISE SOURCE
Kikuo Mita, Tokyo, Japan, assignor to Eastman Kodak Company, Rochester, N.Y.
Filed Dec. 28, 1989, Ser. No. 458,018
Claims priority, application Japan, Sep. 5, 1989, 1-230706
Int. Cl.[5] H04N *1/40*
U.S. Cl. 358—466 **3 Claims**

FIRST EMBODIMENT

1. A half-tone binarization generator whereby input multi-level brightness information is converted to represent the brightness information as black and white level signals, comprising:
noise generating means for generating noise;
extraction means for extracting high-frequency components from the noise generated by the noise generating means;
adder means for adding the high-frequency noise from the extraction means to the multilevel brightness information;
comparison binarization means for comparing brightness information to which the high-frequency noise has been added by the adder means with a predetermined threshold value and providing a black level signal or a white level signal depending if the noise added brightness information is smaller or larger than the threshold value.

5,006,939
VIDEO EDITING AND PROCESSING SYSTEM WITH REVERSE VIDEO WITH FORWARD AUDIO REPRODUCTION
Robin A. Cawley, Burghclere, Great Britain, assignor to Quantel Limited, Newbury, United Kingdom
Continuation of Ser. No. 27,888, Mar. 19, 1987, abandoned. This application Oct. 19, 1989, Ser. No. 426,454
Claims priority, application United Kingdom, Apr. 10, 1986, 8608775
Int. Cl.[5] H04N *5/91*
U.S. Cl. 360—14.1 **7 Claims**

1. Apparatus for use in editing a sequence of video frames having an associated audio soundtrack, said apparatus comprising:
(a) a video signal storing means for storing video signals representative of each of a plurality of video frames, said plurality of video frames constituting said sequence;

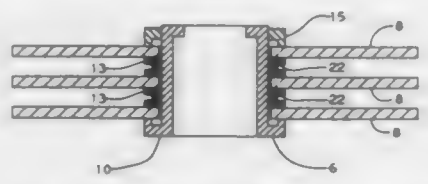


(b) audio signal storing means for storing audio signals constituting said soundtrack, said audio signal storing means storing said audio signals as audio signal frames each corresponding to that portion of the soundtrack that is associated with a respective one of said plurality of video frames; and
(c) control means for:
(i) addressing said video signal storing means to determine the output of video signals therefrom, said control means enabling video signals representative of said video frames to be output in reverse order to the order of said sequence, and
(ii) addressing said audio signal storing means to determine the output of audio signal frames therefrom in the order of said sequence, said control means furthermore enabling any selected audio signal frame to be output at the same time as its corresponding video frame is output in a verse order sequence of video frames; the apparatus thereby facilitating identification fthe position where an edit is required by enabling a reverse video frame-forward audio frame sequence to be output in which a selected frame of audio signals coincides in time with its corresponding video frame.

5,006,940
AUTOMATIC CHANGER FOR DIGITAL AUDIO CASSETTE TAPE PLAYER
Hishashi Hamachi, and Tamotsu Harada, both of Saitama, Japan, assignors to Pioneer Electronic Corporation, Tokyo, Japan
Filed Sep. 30, 1988, Ser. No. 251,618
Claims priority, application Japan, Sep. 30, 1987, 62-244405
Int. Cl.[5] G11B *15/68*
U.S. Cl. 360—92 **7 Claims**

1. An automatic changer for a digital audio cassette tape player, comprising:
a plurality of holding means (6) for holding a plurality of tape cassettes, each cassette being inserted into an individual insertion opening with a lid of said tape cassette being located inwardly so that a label on each of said tape cassettes can be seen from a front side of said player;
support means (7) for supporting said holding means;
a tape conveying mechanism for conveying a selected one of said tape cassettes to and from said tape player;
conveying means for picking up selectively one of said plurality of holding means, separating said one holding means away from said support means, and setting the selected cassette held in said one holding means onto said tape conveying mechanism with the selected cassette being held by said holding means; and
moving unit drive means (19) for driving said conveying means so that the selected cassette is loaded onto said cassette tape player.

5,006,941
REVERSIBLE DRIVE MECHANISM FOR A TAPE RECORDING APPARATUS
Akira Otsuki, Iwaki, Japan, assignor to Alpine Electronics Inc., Tokyo, Japan
Filed Mar. 3, 1989, Ser. No. 319,517
Claims priority, application Japan, Apr. 6, 1988, 63-46693; Apr. 6, 1988, 63-46694
Int. Cl.[5] G11B *5/008*
U.S. Cl. 360—96.2 **4 Claims**



1. A tape recording apparatus comprising:
a motor rotatable both in a forward direction and a reverse direction;
a pair of capstan journals coupled to said motor such that said journals rotate in the same direction as said motor;
a pair of pinch rollers mounted on a pair of leaves, said pair of pinch rollers and said pair of leaves being movable in one direction to bring said pinch rollers into contact with said capstan journals and tape interposed between said capstan journals and said pinch rollers, and movable in another direction to separate said pinch rollers from said capstan journals;
a head base for mounting a magnetic head in operative relationship to said tape, said head base being held in a retreated position by a spring wherein said magnetic head is separated from said tape, and said head base being slidably movable into an advanced position wherein said magnetic head contacts said tape;
a head base advancing mechanism for moving said head base against a force of said spring and into said advanced position, said head base advancing mechanism comprising a sub base coupled to said head base for movement with said head base and a gear having a cam surface engaged with said sub base, said gear being rotatable by said motor such that said cam moves said sub base toward said advanced position;
a change mechanism coupled to said gear and being operative to rotate said gear in one direction regardless of said rotation direction of said motor;
a holding mechanism engaged with said gear for holding said head base in said advanced position,
wherein when said motor begins an operation to change direction of rotation when said magnetic head is reproducing, said holding mechanism is released from said gear and said head base moves into said retreated position, and said gear is rotated in the same direction regardless of the direction of rotation of said motor, whereafter said sub base is moved to said advanced position by said cam and said head base is held at said advanced position by said holding mechanism engaged with said gear.

5,006,942
RIGID MAGNETIC DATA STORAGE DISK ASSEMBLY WITH GROOVED SPACER

Peter E. Brooks, and Kimberly G. Jan, both of Rochester, Minn., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Apr. 17, 1989, Ser. No. 339,282
Int. Cl.[5] G11B *17/08*
U.S. Cl. 360—98.08 9 Claims

1. A rigid magnetic data storage disk assembly supporting a plurality of axially aligned disks which have an opening therein, which forms an inner cylindrical surface on each said disk and having an inner diameter near the opening, said storage disk assembly comprising

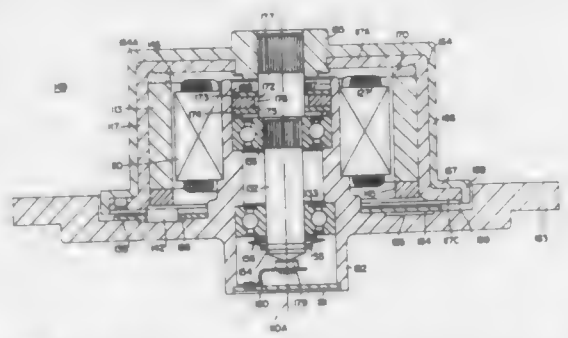
a hub having a lower flange presenting a first annular support surface at one axial end of said plurality of disks;

an annular spacer positioned between and separating each adjoining pair of disks of said plurality of disks and adjoining the inner diameter of said disks;

each said spacer having an inner cylindrical surface and an outer cylindrical surface, each spacer having an annular groove extending radially inward from the outer cylindrical surface;

clamping means for said plurality of disks,

said clamping means presenting a second annular support surface axially aligned with said first annular support surface, said clamping means positioned at the other axial end of said plurality of disks; and

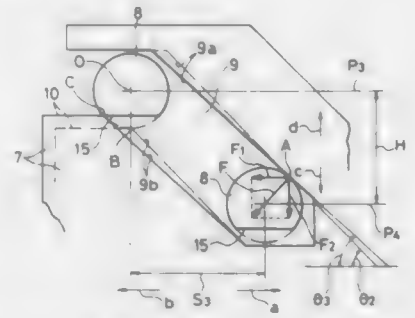


connecting means securing said clamping means to said hub to compressively retain said plurality of disks and said spacers between said first and second annular support surfaces with the grooved portions of said spacers axially aligned between said first and second annular support surfaces.

5,006,943
DISK STORAGE DRIVE

Dieter Elsässer, St. Georgen/Schwarzwald, and Johann von der Heide, Schramberg, both of Fed. Rep. of Germany, assignors to Papst-Motoren GmbH & Co., KG, St. Georgen, Fed. Rep. of Germany

Continuation of Ser. No. 32,954, Mar. 31, 1987, Pat. No. 4,779,165, which is a continuation of Ser. No. 733,231, May 10, 1985, abandoned, which is a continuation-in-part of Ser. No. 412,093, Aug. 27, 1982, abandoned. This application Oct. 18, 1988, Ser. No. 259,132
Claims priority, application Fed. Rep. of Germany, Sep. 7, 1981, 3135385
Int. Cl.[5] G11B *5/16*
U.S. Cl. 360—99.08 24 Claims



1. A disk storage drive with a brushless drive motor having a stator provided with a winding; an external rotor coaxially surrounding the stator and spaced therefrom by a substantially cylindrical air gap, said rotor having a permanent magnetic rotor magnet and a soft magnetic yoke; and a hub concentric to the yoke, said hub being connected to the rotor for rotation therewith and having a cylindrical disk support portion which can pass through a central opening of a storage disk for receiving at least one storage disk, said hub having an outwardly radially projecting flange at one end said motor including a radially extending assembly flange adjacent said one end of said hub, said assembly flange having a recess co-operating with said radially projecting flange to allow said radially projecting flange to nest in said recess, thereby making the motor more compact.

5,006,944
CASSETTE LOADING DEVICE WITH A FLAT-CUT CAM FOLLOWER

Kenji Miyasaka, Kanagawa, Japan, assignor to Sony Corporation, Tokyo, Japan

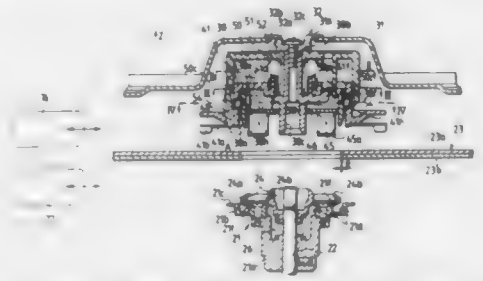
Filed Sep. 21, 1989, Ser. No. 410,498
Claims priority, application Japan, Oct. 12, 1988, 63-133125[U]
Int. Cl.[5] G11B *17/04*
U.S. Cl. 360—99.06 3 Claims

1. In a cassette loading device comprising:

a cassette holder capable of ascending and descending between a cassette inserting position and a cassette loading position in a direction perpendicular to a cassette inserting direction together with a cassette inserted therein;

a slide member having two sides which is slidable in said cassette inserting direction;

cam means provided in said sides of said slide member and inclined with respect to said cassette inserting direction, and



columnar cam followers arranged on the respective sides of said cassette holder so as to be coupled with said cam means of said slide member, whereby said cassette holder is raised or lowered while said slide member is moved in said cassette inserting direction;

the improvement in which a D-cut flat portion is formed on a lower portion of each of said columnar cam followers so that the amount of inclination of said cam means can be reduced without changing predetermined displacements of both said slide member and said cassette holder.

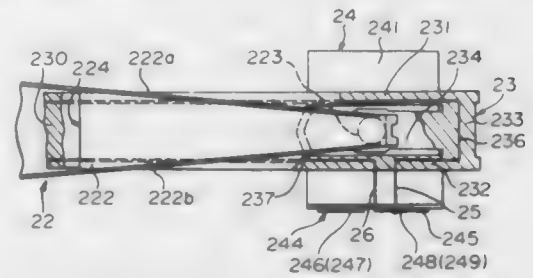
5,006,945
DISK PLAYER HAVING DUAL-SIDE PLAYBACK CAPABILITY

Shigeharu Furusawa, Saitama, Japan, assignor to Pioneer Electronic Corp., Tokyo, Japan

Filed Feb. 21, 1990, Ser. No. 482,626
Claims priority, application Japan, Feb. 22, 1989, 1-42653; Oct. 19, 1989, 1-272571
Int. Cl.[5] G11B *17/028*
U.S. Cl. 360—99.12 8 Claims

1. A dual-side use disk player of the type in which a data record disk including first and second circular substrates bonded together, each of said first and second circular substrates having a signal recording layer and a center hole, is centered on a turntable and is pressed against said turntable to thereby carry out a playback of data said disk player comprising:

a disk clamping mechanism including a support member movable to and from a disk carrying surface of said turntable within a range of three positions; said three positions being a non-clamping position farthest from said disk carrying surface, a first clamping position which is a middle position, and a second clamping position; said disk clamping mechanism further including positioning means for positioning said support member, a pressure member for pressing a part of said data record disk, which is near the center hole of said data record disk, and pressure applying means for applying a force to said pressure member to press said disk;



disk centering means including a first centering member movable along an axis of said turntable with respect to said disk carrying surface, said first centering member adapted to be inserted into said center hole of said first circular substrate, said disk centering means further including biasing means for biasing said first centering member in a projecting direction, and a second centering member adapted to be inserted into said center hole of said second circular substrate, said second centering member being disposed in said pressure member so as to be movable between an insertion allowing position where said second centering member is allowed to be inserted into said center hole of said second circular substrate, and an insertion prohibiting position where said second centering member is prohibited from being inserted into said center hole of said second circular substrate, whereby with the movement of said support member to said second clamping position, said second centering member is moved near said disk carrying surface and inserted into said center hole of said second circular substrate, and said first centering member is moved below said disk carrying surface; and

wherein said pressure applying means includes an attracting force generating means for attracting said pressure member toward said turntable; and further wherein said support member includes position select/hold means, whereby when said support member is at said non-clamping position, said position select/hold means is out of contact with said pressure member, and with the movement of said support member between said first clamping position and said second clamping position, said position select/hold means positions said second centering member at said insertion allowing position, and also at said insertion prohibiting position.

5,006,946
FLEXIBLE POLYMERIC RESINOUS MAGNETIC HEAD SUPPORTING DEVICE

Mikio Matsuzaki, Tokyo, Japan, assignor to TDK Corporation, Tokyo, Japan

Filed Apr. 19, 1989, Ser. No. 340,533
The portion of the term of this patent subsequent to Mar. 19, 2008, has been disclaimed.
Int. Cl.[5] G11B *5/48, 5/60*
U.S. Cl. 360—104 4 Claims

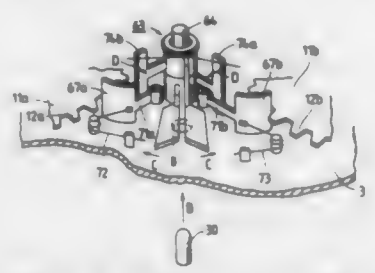
1. A magnetic head supporting device which comprises:

a supporter having a resilient spring portion and a rigid beam portion contiguous to said resilient spring;

a flexible member having one end attached to said supporter at a portion near a free end of said supporter;

a loading projection provided at one of an upper surface of said flexible member and a lower surface of said supporter at a portion near the free end of said supporter to thereby transmit a loading force from the free end of said supporter to said flexible member; and

a magnetic head having a slider with reading/writing elements connected thereto, the magnetic head being fixed to the lower surface of said flexible member, wherein said flexible member substantially exclusively comprises a plate of a polymeric resinous material positioned on the supporter and having conductors for wiring, said conductors are electrically connected to electrode for said reading/writing elements of the magnetic head, and wherein the plate of polymeric resinous material extends on the supporter along a longitudinal direction of the supporter, the conductors are embedded in the plate of polymeric resinous material and said plate has a free end portion extending to a lower portion of said rigid beam of said supporter.



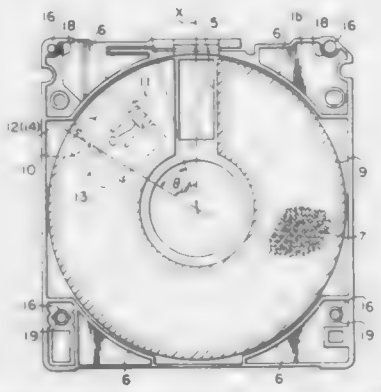
5,006,947
MAGNETIC TAPE CASSETTE HAVING IMPROVED DUST PROOFING

Shozo Onmori; Daisuke Takahashi, and Kengo Oishi, all of Kanagawa, Japan, assignors to Fuji Photo Film Co., Ltd., Kanagawa, Japan

Division of Ser. No. 318,866, Mar. 6, 1989. This application Jul. 5, 1990, Ser. No. 549,524
Claims priority, application Japan, Mar. 11, 1988, 63-31697[U]; Mar. 25, 1988, 63-69850[U]; Mar. 30, 1988, 63-40982[U]
Int. Cl.[5] G11B *23/087*
U.S. Cl. 360—132 2 Claims

1. A magnetic tape cassette housing a pair of tape winding bodies around which a magnetic tape is wound, the magnetic tape being pulled exteriorly of the cassette for recording and playback, comprising: a reel brake for preventing angular movement of said tape winding bodies comprising a pair of engaging pawls each pivotally supported at one end thereof and having a free and urged in a direction to engage a gear portion formed on a flange of respective one of said tape wind-

ing bodies, and a pair of rotatable body portions each having an abutment portion and an operating portion, both of which extend from said rotatable body portion radially of said body portion, said abutment portion being engageable with a respective one of said engaging pawls intermediate the length of said engaging pawl so as to move said engaging pawls out of engagement with said gear portions, a brake release insertion member being insertable into said cassette through a hole



through a wall of said cassette so as to engage each of said operating portions to move said abutment portions, said rotatable body portions being urged in such directions as to hold said operating portions in contact with each other to close said hole, each abutment portion urging a respective one of said engaging pawls to move said engaging pawls out of engagement with said gear portions when said operating portions are moved away from each other, said operating portions not moving with movement of said engaging pawls.

DISK CARTRIDGE WITH IMPROVED CLEANING MECHANISM

Kazuya Fukunaga, Toride; Yoshitake Kato, Ibaraki, both of Japan, and Hiroyuki Yoshimura, Bonita, Calif., assignors to Hitachi Maxell Ltd., Osaka, Japan

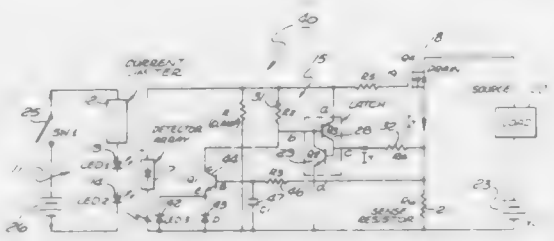
Filed Sep. 13, 1988, Ser. No. 243,688
Claims priority, application Japan, Sep. 14, 1987, 62-228529
Int. Cl.[5] G11B *23/033*
U.S. Cl. 360—133 **5 Claims**

1. A cartridge case including an upper case, a lower case and a head insertion aperture at a predetermined position in each of said upper and lower cases;

a pair of cleaning sheets made of a non-woven fabric, one of said sheets being respectively secured to the inner surface of each of said upper and lower cases;

a disk having respective surfaces disposed rotatably between said cleaning sheets; and

at least one resilient member disposed between a corresponding one of said cases and a related one of said cleaning sheets, said resilient member being adapted to provide a cleaning position by pressing said cleaning sheets into direct contact with said surfaces of said disk,



said resilient member being positioned within 60 degrees upstream of a central axis of said head insertion aperture relative to the rotating direction of said disk such that said cleaning position is provided by an inclined portion of said resilient member located within said 60 degrees.

LOCK HANDLE FOR PRINTED WIRING BOARD ASSEMBLIES AND THE LIKE

Guy D. Albert, and Robert C. Beaty, both of Raleigh, N.C., assignors to Alcatel NA Network Systems Corp., Raleigh, N.C.

Filed May 5, 1989, Ser. No. 348,034
Int. Cl.[5] H05K *7/14*; **H05F** *3/02*
U.S. Cl. 361—220 **47 Claims**

1. A locking handle assembly for use in manually inserting and extracting a component from an enclosure formed in a support having a protruding feature thereon, comprising:

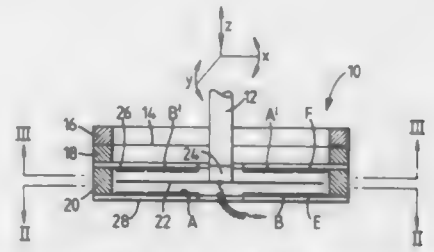
a faceplate member mounted on the component, said faceplate member having means mounting said faceplate member to the component, means for pivotally mounting a handle member thereon for pivotal movement about a single axis, and means on said faceplate member for locking a handle member thereto; and

a handle member pivotally mounted on said pivotal mounting means of said faceplate member for pivotal movement about a single axis between a closed position with the component fully inserted within the enclosure and an open position with the component at least partially extracted from the enclosure, said handle member having a locking element for variably engaging said locking means of said faceplate member in a plurality of positions to adjustably hold said handle member in said closed position thereby compensating for tolerance buildup in the handle assembly, component and support, said handle member having means for engaging the protruding feature of the enclosure when said handle member is moved to its closed position.

40. A handle assembly for use in manually inserting and extracting a component from a support forming an enclosure having a protruding feature thereon, comprising:

A. a faceplate member mounted on the component, said faceplate member having means mounting said faceplate member to the component and means for pivotally mounting a handle member thereon;

B. a handle member pivotally mounted on said pivotal mounting means of said faceplate member for movement between a closed position with the component fully inserted in the enclosure and an open position with the component at least partially extracted from the enclosure, said handle member having means for engaging the protruding feature of the enclosure when said handle member is moved to its closed position; and



electrostatic discharge means providing grounding electric contact between the protruding feature and said handle and faceplate members for discharging electrical energy to protect the component.

U.S. Cl. 361—321 **9 Claims**

1. A solid dielectric capacitor comprising a dielectric ceramic body and at least two electrodes in contact therewith, the dielectric ceramic body consisting essentially of:

(a) 100 parts by weight of a major ingredient expressed by the formula,

$$(1-\alpha)\{(Ba_{k-x}M_x)O_kTiO_2\}+\alpha CaZrO_3,$$

where

M is at least either of magnesium and zinc;

α is a numeral in the range of 0.005 to 0.040;

k is a numeral in the range of 1.00 to 1.05; and

x is a numeral in the range of 0.01 to 0.10; and

(b) from 0.2 to 5.0 parts by weight of an additive mixture of lithium oxide, silicon dioxide and at least one metal oxide selected from the group consisting of barium oxide, strontium oxide, calcium oxide, magnesium oxide and zinc oxide, the relative proportions of lithium oxide, silicon dioxide and at least one selected metal oxide constituting the additive mixture being in that region of the ternary diagram of FIG. 2 attached hereto which is bounded by lines sequentially connecting:

the point A where the additive mixture consists of one mole percent lithium oxide, 80 mole percent silicon dioxide, and 19 mole percent metal oxide;

the point B where the additive mixture consists of one mole percent lithium oxide, 39 mole percent silicon dioxide, and 60 mole percent metal oxide;

the point C where the additive mixture consists of 30 mole percent lithium oxide, 30 mole percent silicon dioxide, and 40 mole percent metal oxide;

the point D where the additive mixture consists of 50 mole percent lithium oxide, 50 mole percent silicon dioxide, and 0 mole percent metal oxide; and

the point E where the additive mixture consists of 20 mole percent boric oxide, 80 mole percent silicon dioxide, and 0 mole percent metal oxide.

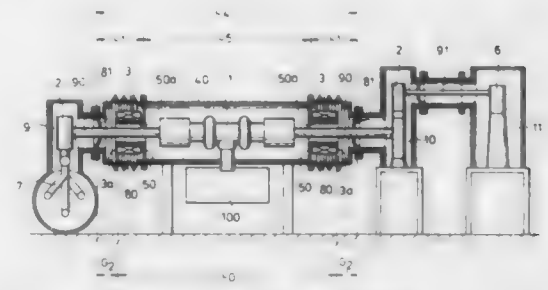
GAS INSULATION SWITCHGEAR



Kenzi Sasamori; Hiroshi Yamamoto, and Hiroshi Aoki, all of Amagasaki, Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Filed Jan. 19, 1990, Ser. No. 467,201

Claims priority, application Japan, Jan. 31, 1989, 1-10538[U]

Int. Cl.[5] H02B *7/01*

U.S. Cl. 361—335 **2 Claims**

1. A gas insulation switchgear, comprising:

a first earthed tank containing a circuit breaker therein,

a pair of second earthed tanks, each respectively containing a disconnector therein;

an expansion joint interconnecting said first earthed tank and each of said pair of second earthed tanks;

said first earthed tank, said second earthed tanks and said expansion joints together defining a continuous gas-tight space containing an insulation gas;

a pair of conductors respectively penetrating through said pair of expansion joints and interconnecting said circuit breaker and said disconnectors; and

a pair of current transformers provided in respective hollow inside spaces of said expansion joints and having holes formed therein in a manner such that said respective pair of conductors pass through said holes formed in said current transformers.

MEANS FOR ROUTING CONNECTION CABLES OUT OF A TABLE TOP TERMINAL

Fredrik L. N. Kallin, Kitchener; Alistair R. Hamilton, Waterloo, and Graham Luckhurst, Kitchener, all of Canada, assignors to NCR Corporation, Dayton, Ohio

Filed Jan. 11, 1990, Ser. No. 463,646
Int. Cl.[5] H05K *5/00*
U.S. Cl. 361—390 **10 Claims**

1. An apparatus comprising:

a cabinet having a base portion including a perimeter portion;

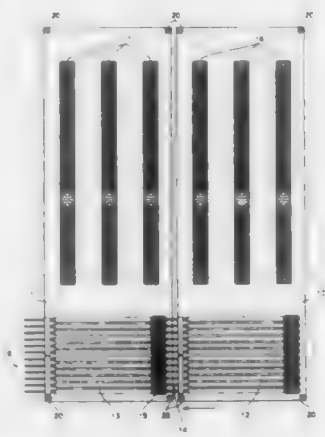
said perimeter portion having at least one slot therein to receive a cable therein;

said base portion having a coupling member therein located adjacent to said at least one slot;

said cable having a cooperative coupling member on an end thereof, with said cooperative coupling member being coupled to said coupling member;

said cabinet also having a cover coupled to said base portion to enable said cover to be moved between opened and closed positions relative to said base portion; and

said at least one slot being located in said perimeter portion to enable said cover to be moved to said closed position only when said cable is properly positioned in said at least one slot.



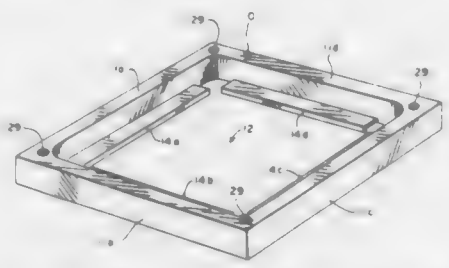
5,006,961

SEGMENTED BACKPLANE FOR MULTIPLE MICROPROCESSING MODULES

Juan A. Monico, San Jose, Calif., assignor to Catene Systems Corporation, San Jose, Calif.

Continuation of Ser. No. 185,709, Apr. 25, 1988, abandoned.
This application Oct. 12, 1989, Ser. No. 420,746
Int. Cl.[5] H05K *1/04*
U.S. Cl. 361—413 **3 Claims**

1. A segmented computer backplane adapted to have one or more printed circuit cards connected to it, said backplane forming a single unitary bus and backplane structure made up of a plurality of physically separable but interconnected backplane segments, each backplane segment comprising: a plurality of connecting means for respectively connecting a plurality of said cards to said backplane segment; a plurality of fixed electrical interconnections for making connections to and between said plurality of connecting means, said connections being completely established within said backplane segment irrespective of whether said cards are actually inserted into said connecting means; a bus segment which is removably connected with other bs segments of other backplane segments



to form a unitary bus; and a bus segment connector adapted to connect said bus segment of said backplane segment to the bus segment of another backplane segment to form a unitary bus and backplane, said plurality of connected cards carrying out electrical communication among themselves entirely through the said plurality of fixed electrical interconnections of their own backplane segment without communication through said bus, whereby said connected backplane segments form a unitary backplane having its inter-segment communication carried out through said single unitary bus.

5,006,962

APPARATUS FOR SURFACE MOUNTING AN INTEGRATED CIRCUIT PACKAGE

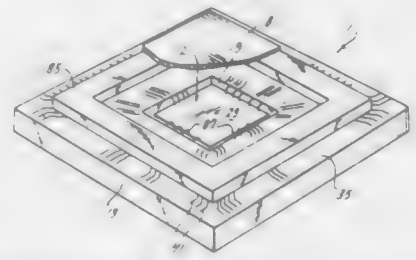
Kevin Haley, San Jose, Calif., assignor to Intel Corporation, Santa Clara, Calif.

Filed Dec. 28, 1989, Ser. No. 458,558
Int. Cl.[5] H05K *7/02*
U.S. Cl. 361—417 **6 Claims**

1. An apparatus for mounting an integrated circuit onto a base, wherein leads of said integrated circuit reside upon electrical contacts of said base, comprising:

a housing member having a central opening, wherein said housing member is disposed over said integrated circuit residing on said base and wherein said integrated circuit resides within said central opening;

at least two beam members integral with said housing member and extending inwardly toward said central opening from said housing member from at least two opposing sides of said housing member, each of said beam members having a distal end which forms an angle downwardly toward leads of said integrated circuit such that each said distal end resides over lead portion of said integrated circuit residing on said contacts;



retaining means coupled to said housing member for retaining said housing member on said base, wherein tightening said retaining means causes each of said distal ends to exert a sideward force on said leads to create tension in retaining said integrated circuit stationary and a downward force to retain said leads on said contact.

5,006,963

SELECTABLE CHIP CARRIER

James B. Spangler, Tustin, and Steve G. Rector, Riverside, both of Calif., assignors to McDonnell Douglas Corporation, Long Beach, Calif.

Filed Dec. 18, 1989, Ser. No. 451,639
Int. Cl.[5] H01L *23/02*
U.S. Cl. 361—417 **13 Claims**

1. A selectable chip carrier adapted to receive an integrated circuit chip which has a plurality of conductive terminal pads disposed about its periphery, and adapted to communicate with selected ones of the terminal pads, the selectable chip carrier comprising:

a base plate having:

an upper surface adapted to support an integrated circuit chip;

a dielectric substrate having:

an outer periphery;

an upper planar surface;

a lower planar surface supported by said upper surface of said base plate; and

an aperture therethrough for accommodating an integrated circuit chip, said aperture defining an inner peripheral surface of said dielectric substrate;

a plurality of parallel and insulatively separated planar conductive layers disposed adjacent one of said planar surfaces of said substrate, said conductive layers each including:

an outer periphery; and

an integrated circuit chip-accommodating aperture therethrough defining an inner periphery generally coaxial with said aperture in said dielectric substrate, each of said conductive layers extending from its outer periphery to its inner periphery;

a plurality of insulated conductive signal lines lying in a common plane and disposed on said dielectric substrate, said signal lines each including;

associated external conductive signal pads adjacent said outer periphery of said dielectric substrate; and

oppositely disposed internal conductive signal pads adjacent said inner periphery of said dielectric substrate;

electrical coupling means for association with the chip conductive terminal pads, and associated with said internal conductive pads and said planar conductive layers for conductively connecting selected ones of the chip terminal pads to selected ones of said internal signal pads and said conductive layers; and

a metalization layer disposed along said inner peripheral surface of said dielectric substrate, said metalization layer being electrically connected to said ground plane and including:

a bus disposed on said upper planar surface of said dielectric substrate around said integrated circuit chip-accommodating aperture thereof.

5,006,964

LOW RESISTIVITY LOW ESR CAPACITOR ELECTROLYTE

Sidney D. Ross, Williamstown, and Manuel Finkelstein, North Adams, both of Mass., assignors to Sprague Electric Company, North Adams, Mass.

Filed Apr. 30, 1990, Ser. No. 516,996
Int. Cl.[5] H01G *9/02*
U.S. Cl. 361—504 **4 Claims**

1. An electrolytic capacitor comprising spaced aluminum electrodes, an electrolyte contacting said electrodes, said electrolyte having an organic solvent and a phthalate solute with from about 1 wt. % to about 3 wt. % benzil.

5,006,965

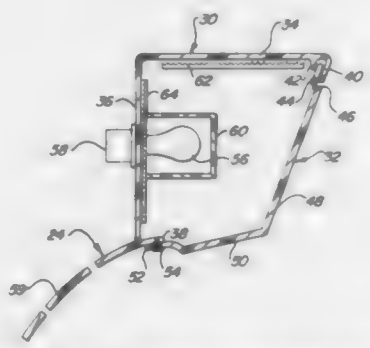
DIMMER FOR FIBER OPTIC LIGHT TRANSMISSION SYSTEMS

Eric M. Jones, Los Angeles, Calif., assignor to Karl Storz Endoscopy-America, Inc., Culver City, Calif.

Filed Mar. 9, 1990, Ser. No. 491,562
Int. Cl.[5] F21V *7/04*
U.S. Cl. 362—32 **3 Claims**

1. A dimmer to attenuate the light provided to an input end of a fiber optic bundle, said driver attenuating light in a focused beam from a constant-intensity light source, said beam having an optical axis, said dimmer comprising:

an opaque vane with a control area disposed in said beam, normal to said optical axis, so disposed and arranged that the beam focuses a spot on said control area, said control area having a movement axis always coincident with said optical axis,



said control area having a first band on one side of the movement axis, and a second band on the other side thereof,

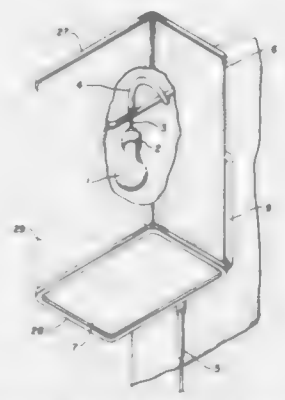
said first band having a substantial imperforate portion extending along said movement axis, whereby to block substantially 50% of the light in the spot, and an open portion extending along said movement axis for passing said 50% of the light, blockage or transmission being a function of the location of said first band relative to said spot,

said second band, along portions adjacent to said imperforate portion of said first band, having slots extending therethrough, interspersed with opaque bars, the width and spacing of said slots and bars being such as to provide increasing transmission of light through said second band when the vane is moved so as to move the control area relative to the spot, toward the open portion of the first band, until adjacent to the location where the imperforate and open portions of the first band join one another, the second band transmits substantially 50% of the light of the beam, and

along the portion of the second band adjacent to the open portion of the first band, the second band has slots interspersed with bands, whose width and spacing successively change such that with additional movement of the vane, the light transmitted by the second band gradually increases, being additive to the light transmitted by the open portion of the first band.

5,006,966
TRANSIT VEHICLE LIGHTING FIXTURE
Liudas K. Mikalonis, Northville, Mich., assignor to Transmatic, Inc., Waterford, Mich.
Filed Aug. 30, 1989, Ser. No. 400,426
Int. Cl.[5] B60Q *3/00*
U.S. Cl. 362—74 **5 Claims**

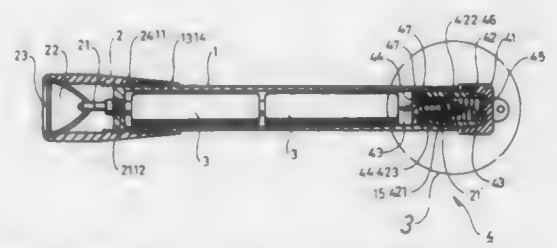
1. In a public transit vehicle having side windows, an aisle extending along the longitudinal axis of the vehicle and a passenger seating area on either side of the aisle, a lighting fixture arrangement for preferentially illuminating the seating area and minimizing the illumination of the aisle and side windows, comprising:
- a lighting fixture above each passenger seating area,
- each fixture having an elongated light housing extending generally parallel to the aisle, the housing comprising an upper surface, an adjacent side surface, and a translucent cover having a side wall spaced from the said side surface and a bottom wall spaced from the upper surface to define a cavity,
- a plurality of spaced incandescent lamps within the housing, and
- optical means positioned in the housing adjacent each lamp to receive light from the adjacent lamp for preferentially directing light from the lamps through the bottom wall of the translucent cover to the seating area, whereby the seating area is illuminated at a higher level than the aisle and the side windows.



5,006,967
SELF-ILLUMINATING GLASS BLOCK CONSTRUCTION UNIT
Gary Diamond, 18220 Margate St., Tarzana, Calif. 91356
Filed May 22, 1989, Ser. No. 355,411
Int. Cl.[5] F21S *1/14*
U.S. Cl. 362—147 **5 Claims**

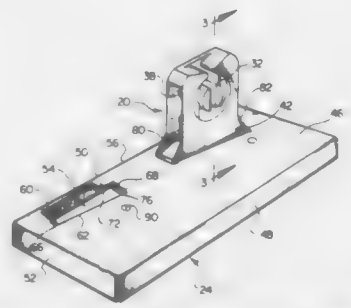
1. A modular device formed of a hollow glass block construction unit used for forming walls and panels, the device comprising,
- a glass block construction unit assembly having all faces made of glass forming a chamber,
- an electric light means assembly integral with said glass block unit,
- said electric light means assembly penetrating through a wall of said glass block unit,
- said electric light means assembly being removable from said glass block unit,
- electrical conductors connected to said electric light means being located at the exterior of said glass block unit,

- said construction unit assembly thereby forming a self-illuminating glass block construction unit.



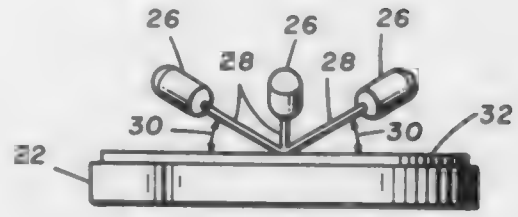
5,006,968
WALL MOUNTED LAMP WITH ADJUSTABLE PATTERN OF ILLUMINATION
Elmo E. Miller, 8201 16th St., Apt. 1126, Silver Spring, Md. 20910
Filed Dec. 27, 1989, Ser. No. 457,833
Int. Cl.[5] F21S *1/02*
U.S. Cl. 362—147 **10 Claims**

1. A wall mounted lighting fixture in which the pattern of illumination can be adjusted by a means comprising:
- a shade that is stationary with respect to a wall;
- a cane shaped tube attached to said wall, with its curved segment terminating within said shade;
- a straight tube that slides within said cane shaped tube;
- a bulb and socket suspended within said shade by an electric cord that passes through both of said tubes, which cord has a diameter providing a tight fit within said straight tube so that said cord, socket and bulb may be moved by means of said straight tube.



5,006,969
FLASHLIGHT WITH END CAP SWITCH
Larry Lai, Chia-Yi Hsien, Taiwan, assignor to Plum Industrial Co., Ltd., Chiayi Hsien, Taiwan
Filed Oct. 31, 1989, Ser. No. 430,619
The portion of the term of this patent subsequent to Jan. 8, 2008, has been disclaimed.
Int. Cl.[5] F21L *7/00*
U.S. Cl. 362—206 **3 Claims**

1. A flashlight comprising a conductive cylinder for receiving at least one dry cell, a mount at one end of the cylinder for a light bulb, said one end of the cylinder having an external thread, an internally threaded light-bulb shell for threading on said external thread, said cylinder having an opposite end with an internal thread, a non-conductive whorl ring with an outer thread to fit said internal thread, the whorl ring carrying an



axially extending spiral spring for electrically contacting a dry cell in the casing, and a conducting cover on a rearward end of the whorl ring for selectively engaging and disengaging the casing by inwardly and outwardly threading the whorl ring on said internal thread thereby selectively completing and breaking a circuit containing the light bulb and dry cell so as to activate and deactivate the light bulb.

5,006,970
INTERLOCK ELECTRICAL SOCKET MOUNT
Edward T. Mackiewicz, Elmwood Park, Ill., assignor to Kenall Manufacturing Company, Gurnee, Ill.
Filed Dec. 29, 1989, Ser. No. 458,953
Int. Cl.[5] F21S *3/00*
U.S. Cl. 362—217 **6 Claims**

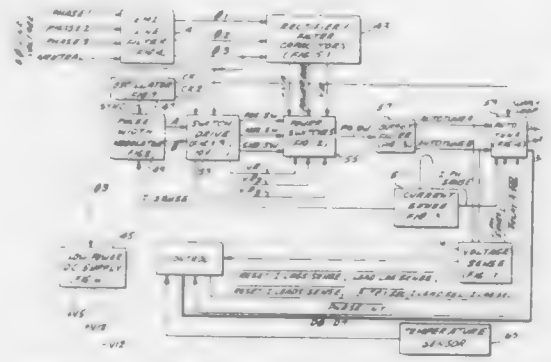
1. In a fluorescent light fixture including panel means for supporting thereon an electrical socket assembly, said socket assembly having a base and an upstanding wall,
- said wall being adapted for supporting a fluorescent lamp operatively coupled thereto,
- the improvement wherein
- said panel means is formed with cut-out zone means including a generally elongate opening for insertably receiving said upstanding wall of said socket assembly inserted upwardly through said panel means,
- said panel means including, in a sector of a perimetric margin bounding and defining said cut-out zone means, wing means integrally formed with said panel means and projecting toward said opening for invasively slidably penetrating said socket assembly at an opposed groove-like slot formed in said socket assembly adjacent said base and laterally thereof,
- said wing means constituting means for effecting mechanical intercoupling between said panel means and said socket assembly upon insertion of said wall means of said socket assembly upwardly through said opening in said panel means and upon arcuately shifting displacement of said base of said socket assembly toward said wing means for positively seating said wing means of said panel means within the slot formed in said socket assembly, lockingly to engage said socket assembly with said panel means.

5,006,971
LOW POWER SAFETY FLASHER
Lloyd T. Jenkins, 3540 Alipha Pl., Pensacola, Fla. 32503
Filed Jul. 23, 1990, Ser. No. 556,669
Int. Cl.[5] F21L *15/02*
U.S. Cl. 362—252 **4 Claims**

1. A low-power light-weight flashing light source, said source comprising:
- a. a plurality of high-intensity separate LED's, said LED's producing when energized a total of at least 6 candelas, each said separate LED producing when energized an intense central cone of light directed along an axis individual to said separate LED, said axes being oriented between 20 and 40 degrees above the horizontal plane;
- b. a refracting lens having a perimeter, said lens surrounding and covering said plurality of LED's, said lens comprising a plurality of refracting striations about said perimeter, said LED's and said striations being positioned and oriented such that said striations intercept and scatter said intense central cones of light whereby said light source may be readily seen by observers 360 degrees around said light source; and
- c. electronic power supply means for periodically and simultaneously energizing said plurality of LED's.

5,006,972
SEA WATER BATTERY POWER CONVERTER
Russell E. Hammond, and John L. Henry, San Diego, both of Calif., assignors to The United States of America as represented by the Secretary of the Navy, Washington, D.C.
Continuation of Ser. No. 353,585, May 18, 1989, abandoned.
This application Sep. 4, 1990, Ser. No. 579,201
Int. Cl.[5] H02M *3/337*
U.S. Cl. 363—24 **15 Claims**

1. A power converter for increasing the source voltage of a direct current power source to a higher voltage, comprising:
- first means operably coupled to said direct current power source for generating a first output having a voltage higher than said source voltage;
- second means operably coupled to receive said first output from said first means for generating first and second pulse trains having a voltage and a frequency, f, said first pulse train having a phase lag with respect to said second pulse train;
- a transformer operably coupled to receive said first and second pulse trains from said second means, said transformer providing second, third, and fourth outputs each having a voltage greater than said voltages of said first and second pulse trains;
- third means operably coupled to receive said second and third outputs from said transformer for full wave rectifying said second and third outputs of said transformer;
- fourth means operably coupled to receive said fourth output

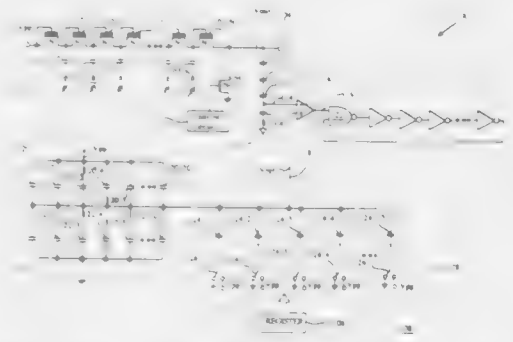


from said transformer for full wave rectifying said third output; and

fifth means operably coupled to said first, second, and fourth means for disabling said first means when said fourth output attains a minimum voltage level.

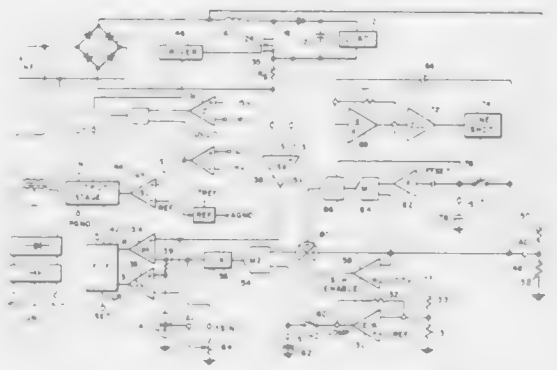
5,006,973
AUTOTUNED RESONANT POWER SOURCE
James B. Turner, Bothell, Wash., assignor to The Boeing Company, Seattle, Wash.
Filed Mar. 28, 1990, Ser. No. 500,745
Int. Cl.[5] H02M 5/40
U.S. Cl. 363—34 **9 Claims**

1. A resonant, quasi-square wave, pulse width modulated power source for supplying constant amplitude, fixed-frequency current, said resonant, quasi-square wave, pulse width modulated power source comprising:
- fixed-frequency pulse generating means for generating fixed-frequency sync pulses;
- pulse width modulation means coupled to said fixed-frequency pulse generating means for receiving said fixed-frequency sync pulses and producing fixed-frequency width modulated pulses in response thereto;
- power supply means for producing relatively high-voltage DC power;
- power switch means coupled to said pulse width modulator and to said power supply means for receiving said width modulated pulses produced by said pulse width modulator and said relatively high-voltage DC power produced by said power supply means and producing switched power pulses whose frequency and duration are controlled by the frequency and duration of the pulses produced by said pulse width modulator and whose magnitude is related to the magnitude of said relatively high-voltage DC power.
- first current sensing means for sensing the current component of said switched power pulses and producing a current sense signal whose magnitude is related thereto, said current sense signal being applied to said pulse width modulator to control the width of the pulses produced by said pulse width modulator such that the amplitude of the current component of said switched power pulses remain substantially constant;
- second current sensing means for sensing the current component of said switched power pulses and producing a current phase signal whose phase tracks the phase of the current component of said switched power pulses;
- voltage sensing means for sensing the voltage component of



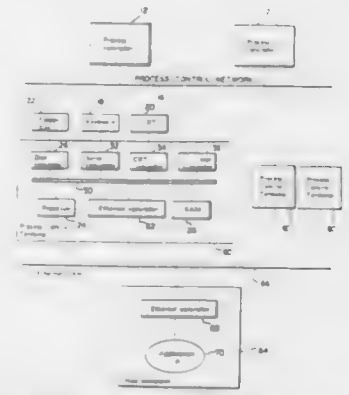
said switched power pulses and producing a voltage phase signal whose phase tracks the phase of said voltage component of said switched power pulses; and
- autotune means coupled to said second current sensing means and said voltage sensing means for receiving said current and voltage phase signals and producing a signal related to the phase difference therebetween and, thus, the phase difference between the current and voltage components of said switched power pulses, said autotune means including a capacitor bank and capacitor bank switching means for controlling the application of capacitance to the output of said power switching means and, thus, the phase difference between the current and voltage components of said switched power pulses, said autotune means also including control means for controlling said capacitor bank switching means so as to maintain the phase difference between said current and voltage phase signals and, thus, the phase difference between the current and voltage components of said switched power pulses low.

5,006,974
ON-CHIP HIGH VOLTAGE GENERATOR AND REGULATOR IN AN INTEGRATED CIRCUIT
Reza Kazerounian, Alameda; Syed Ali, Cupertino, and Boaz Eitan, Sunnyvale, all of Calif., assignors to WaferScale Integration Inc., Fremont, Calif.
Division of Ser. No. 137,782, Dec. 24, 1987. This application Apr. 27, 1990, Ser. No. 516,025
Int. Cl.[5] H02M 7/25
U.S. Cl. 363—60 **11 Claims**



1. An integrated circuit including a voltage supply comprising:
- first means for providing an output voltage on an output lead;
- a first lead for receiving a first voltage;
- a plurality of capacitors coupled in series between said output lead and said first lead, said plurality of capacitors serving as a voltage divider;

- a second lead coupled to a node between two of the capacitors within said plurality, said second lead providing a sense voltage responsive to said output voltage;



- second means for providing a reference voltage, said first means comprising means for comparing said sense voltage and said reference voltage and adjusting said output voltage in response thereto.

POWER FACTOR CORRECTION CIRCUIT
Herman Neufeld, Cranston, R.I., assignor to Cherry Semiconductor Corporation, East Greenwich, R.I.
Filed Nov. 3, 1989, Ser. No. 431,598
Int. Cl.[5] H02M 7/217
U.S. Cl. 363—80 **22 Claims**

1. A power factor correction circuit comprising:
- an input terminal for receiving a divided-down rectified signal;
- a sample-and-hold terminal for connection to a capacitor;
- a switch connected between said sample-and-hold terminal and said input terminal;
- means for periodically closing said switch about when the divided-down rectified signal is approximately at a peak;
- means, connected to said sample-and-hold terminal, for producing a correction signal;
- means for combining said correction signal with said divided-down rectified signal to produce a reference signal;
- voltage sensing means for generating an output voltage error signal corresponding to the deviation of the voltage at the output of a DC-to-DC converter from a predetermined reference voltage;
- means for combining the output voltage error signal with the reference signal to generate a sinusoidal reference signal;
- current sensing means for generating a current-indicating signal indicative of the current flowing into the DC-to-DC converter; and
- current control means receiving the sinusoidal reference signal and the current-indicating signal for regulating the flow of current into the DC-to-DC converter.

PROCESS CONTROL TERMINAL
Larry O. Jundt, Round Rock, Tex., assignor to Fisher Controls International, Inc., Clayton, Mo.
Filed Feb. 23, 1989, Ser. No. 314,549
Int. Cl.[5] G05B 9/02
U.S. Cl. 364—184 **23 Claims**

1. A process control terminal for allowing an operator to perform process control functions and application functions in addition to the process control functions, said process control terminal reserving a predetermined screen portion for process control information to eliminate the possibility that process control alarms will not appear on the screen and thus not be brought to the attention of a process control operator, said process control terminal comprising:
- a processor;
- a bus connected to said processor;
- a display terminal connected to said bus, said display terminal having a screen;
- a process control network controller connected to said bus for allowing process control information to be received from a process controller;
- a host network controller connected to said bus for allowing application information to be received from a host computer and for allowing application information to be transmitted to a host computer;
- first means for periodically determining the existence of an alarm condition, said first means causing an alarm indication to be generated in a first predetermined portion of said screen, said first predetermined portion of said screen being reserved for process control information only; and
- second means for causing said application information to be displayed on said screen, said second means including means for preventing said application information to be displayed on said first predetermined portion of said screen reserved for said process control information, said preventing means causing said application information to be displayed on a second predetermined portion of said screen to ensure that said process control information cannot be overwritten by said application information thus causing a process control operator monitoring said screen to miss an alarm condition.

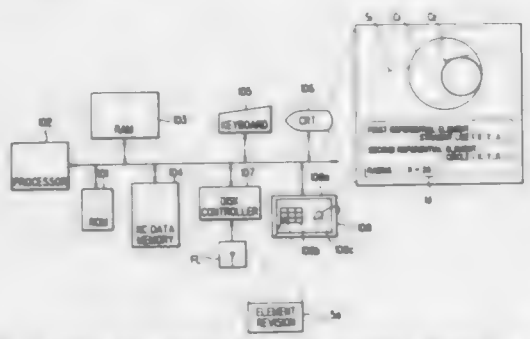
FIGURE ELEMENT REVISING METHOD

Masaki Seki; Takashi Takegahara, both of Tokyo, and Akira Kajitani, Yamanashi, all of Japan, assignors to Fanuc Ltd., Minamitsuru, Japan



PCT No. PCT/JP88/01152, § 371 Date Jul. 14, 1989, § 102(e) Date Jul. 14, 1989, PCT Pub. No. WO89/05007, PCT Pub. Date Jun. 1, 1989

PCT Filed Nov. 15, 1988, Ser. No. 381,409

Claims priority, application Japan, Nov. 18, 1987, 62-291254

Int. Cl.[5] G05B *19/403*

U.S. Cl. 364—192 12 Claims

9. A system for revising a figure element having a figure definition statement based on previously defined figure elements, comprising:

display means for displaying figure elements and figure definition statements;

input means for selecting a figure element to be revised from a plurality of previously defined figure elements; and

control means for controlling revision of the figure element selected by said input means, said control means including

first means for distinguishably displaying on said display means the figure element selected by said input means from the figure elements remaining in the plurality of previously defined figure elements;

second means for determining if the figure element selected by said input means has a figure definition statement based on at least one of the previously defined figure elements, and for identifying the at least one of the previously defined figure elements upon which the figure element is selected is based; and

third means for distinguishably displaying on said display means the at least one of the previously defined figure elements identified by said second means.

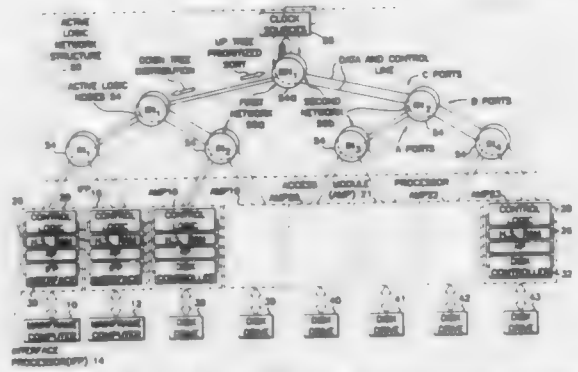
RELATIONAL DATABASE SYSTEM HAVING A NETWORK FOR TRANSMITTING COLLIDING PACKETS AND A PLURALITY OF PROCESSORS EACH STORING A DISJOINT PORTION OF DATABASE

Philip M. Neches, Pasadena, Calif., assignor to Teradata Corporation, Los Angeles, Calif.

Division of Ser. No. 755,436, Jul. 16, 1985, Pat. No. 4,814,979, which is a division of Ser. No. 601,808, Apr. 19, 1984, Pat. No. 4,543,630, which is a division of Ser. No. 250,094, Apr. 1, 1981, Pat. No. 4,445,171. This application Sep. 7, 1988, Ser. No. 241,301

Int. Cl.[5] G06F *15/40, 15/16*



U.S. Cl. 364—200 17 Claims

1. A relational data base machine for processing message packets comprising the combination of:

(a) a plurality of processors, each of the plurality of processors generating and receiving said message packets having a data content, each said message packet defining a task, each of the plurality of processors containing a portion of the relational data base;

(b) a multiple terminal active network having a plurality of bidirectional active nodes and merging at an apex node, each said active node including means responsive to the data content of said message packets for determining priority in simultaneous collisions between two competing said message packets;

(c) at least two like processors coupled to different terminals of the network, the like processors each including means responsive to the message packets for determining

whether the task defined by the message packet is appropriate for that processor; and

(d) a plurality of secondary storages, each coupled to a different one of said processors and each having a disjoint primary subset of the relational data base and a different backup subset of the relational data base, the subsets being distributed in accordance with a predetermined pattern

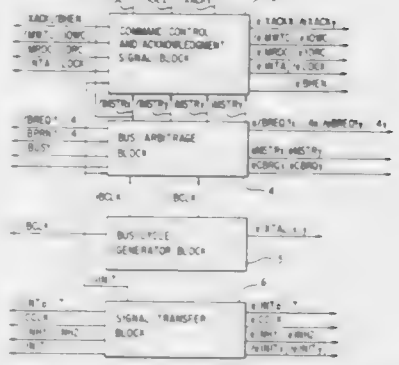
SYSTEM BUS EXPANSION FOR COUPLING MULTIMASTER-CAPABLE MULTICOMPUTER SYSTEMS

Dietmar Beltz; Hans-Juergen Nehler, and Werner Rozek, all of Jena, German Democratic Rep., assignors to Jenoptik Jena GmbH, Jena, German Democratic Rep.

Filed Nov. 8, 1988, Ser. No. 268,818

Claims priority, application German Democratic Rep., Dec. 11, 1987, 310262



Int. Cl.[5] G06F *7/00*

U.S. Cl. 364—200 1 Claim

1. A system bus expansion for coupling multimaster-capable multi-computer systems, said multi-computer systems having spatially separated system buses having master address, data and command lines with a uniform bus protocol for defining a master and slave via bus arbitration, said system bus expansion comprising an expansion module assigned to each system bus and means for sending and receiving addresses, data, commands and status signals, and a transfer cable for intercoupling the expansion modules, said expansion modules comprising:

(a) an address transfer block having bidirectional tristate drivers, the data inputs and outputs of the drivers being connected to addess lines of the assigned system bus as well as to address lines of the transfer cable, said drivers having directional inputs connected to receive a direction control signal /iMSTRX for controlling the direction of address signals with respect to the respective master,

(b) a data transfer block having first and second tristate latchable data drivers, the inputs of said first data drivers being connected to data lines of the transfer cable and the outputs thereof being connected to data lines of the assigned system bus, the inputs of said second data drivers being connected data lines of the assigned system bus and the outputs of the second data drivers being connected to data lines of the transfer cable, said data transfer block comprising means responsive to a write command or an inactive bus command for transferring data without intermediate storage of the data in a direction away from the respective master system bus to the other master system

bus, and, in the event of an active read command, to a slave at the other system bus, or in the event of an interrupt acknowledgement signal active for said slave, to effect the intermediate storage of the data from the addressed slave to at least one of the expansion modules and interrupt data transfer from the respective system bus to the other system bus in the event of an active read command for a slave at the respective system bus, or in the event of an interrupt acknowledgement signal active for the last mentioned slave, selection of the data transfer direction being effected by selection of the first or second data drivers,

(c) a command control and acknowledgement signal block connected to the command lines of the respective system bus, and to command lines of the transfer cable, to the tristate control inputs of the first data drivers via a first signal line /iOE1, to the tristate inputs of the second data drivers via a second signal line /iOE2, and to the latch inputs of the second data drivers via a third signal line /ixACKx,

said command control and acknowledge signal block comprising means for receiving a bus command signal sent within a bus cycle from a master to prepare for a change in the data transporting direction as a function of the bus

command and to delay relaying the bus command to the other system bus independently of the bus command,

means responsive to a write command for a slave at the other system bus for relaying the write command undelayed to such slave, and for receiving an acknowledgement signal sent from the slave and passing it on directly to the respective system bus,

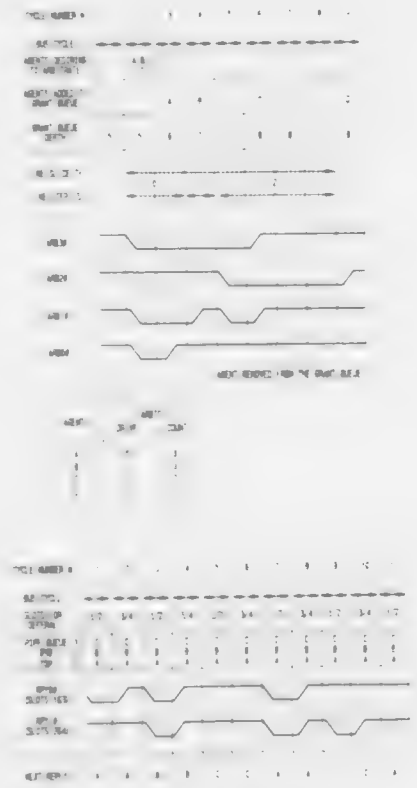
means responsive to a read command or an interrupt acknowledgement signal for a slave at the other system bus for relaying that command with delay to such slave, and responsive to the receipt of an acknowledgement signal from the addressed slave for changing the transport direction over determined signal lines /ieOE1 and /iOE2 in the data transfer block and effecting the intermediate storage of data in the latch data drivers and of the acknowledgement signal in at least one expansion module up to the conclusion of a transfer, and means responsive to the receipt of the acknowledgement signal for inactivating the active bus command on the other system bus, effecting the transfer of data, and, after adjustment to a static state on the respective system bus, sending the acknowledgement signal to the master,

means responsive to a write command to a lave at the respective bus for retaining the data transporting direction, and means responsive to a read command or an interrupt acknowledgement signal for preparing to make a change in the transporting direction, and

means responsive to an inactive bus command on the receptive system bus, for setting the data transporting direction to be from the respective system bus to the other system bus and canceling the intermediate storage of the acknowledgement signal,

(d) a bus arbitrage block connected via bus request signal lines and bus permission signal lines to a master of the assigned system bus and, via the bus request signal lines of the transfer cable, each of which is in turn connected via the bus arbitrage block of the coupled expansion module with a bus request signal line, to masters of the other system bus, connections being provided for this purpose between the expansion module internal lines and the address transfer block and the command control and acknowledgement signal block, said bus arbitrage block being connected to a general bus request line /cBRQ of the assigned system buys and, via general bus request line eCBRQx and eCBRQy of the cable, to the bus arbitrage block of the coupled expansion module and which is connected to a "bus tied-up" signal line /BUSY of the respective system bus and via bus side domination lines eMSTRx and eMSTRy of the transfer cable and the arbitrage block of the coupled expansion module to a "bus tied up" signal line /BUSY of the coupled system bus, said bus arbitrage block comprising means for granting permission to attain bus domination through a master, in response to assigned priorities of the masters from which the bus request signals have been received, said priorities being preprogrammed, bus side domination signals and their negations being determined for each system bus and general bus requests of each system bus being transferred to the respective other bus as a function of the system bus clock signal, and a "bus tied up" signal is transferred from the respective system bus to the other system bus,

(e) a bus clock signal generator block comprised of a bus clock signal generator and a master clock signal generator, the output of the master clock signal generator being connected to a bus clock signal line /BLCK of the respective system bus, as well as to the bus arbitrage block, the output of the master clock signal generator being connected via a signal delay unit to the input of the bus clock signal generator of the respective expansion module and via a line /eXTACKy of the transfer cable to the input of the bus clock signal generator of the other expansion module, and



(f) a block for transferring signals connected to determined bus lines (/INH1, /INH1, /INRT0 . . . /INT7, /CCLK, /INIT) of the respective system bus and via cable lines to a corresponding block of the other expansion module, a signal being transferred, except on a given line /INIT in a preset direction, an active signal on the /INIT signal causing an inactivation of the bus domination signals, whereby the driver in the address transfer block, the data driver in the data transfer block and the command drivers in the common control and acknowledgement signal block are switched into their tristate condition.

METHOD OF INCREASING THE BANDWIDTH OF A PACKET BUS BY REORDERING REPLY PACKETS

Ronald J. Ebersole, Beaverton; David Johnson, Portland; David Budde, Hillsboro; Mark S. Myers, Portland, all of Oreg., and Gerhard Bier, Herxheim, Fed. Rep. of Germany, assignors to Siemens Aktiengesellschaft, Berlin, Fed. Rep. of Germany and Intel Corporation, Santa Clara, Calif.

Filed Oct. 21, 1988, Ser. No. 261,047
Int. Cl.[5] G06F *13/36*
U.S. Cl. 364—200 4 Claims

1. In a data processor in which information is transferred between a plurality of agents attached to a bus by issuing request packets that request data from one of said agents on the bus and reply packets that return data requested by a request packet, a method of mixing request and reply packets on said bus by determining the use of a next-bus cycle using a state of arbitration lines from said agents on said bus, a state of a reply deferral line, and a state of a grant queue and a pipeline queue, said method including the steps of:

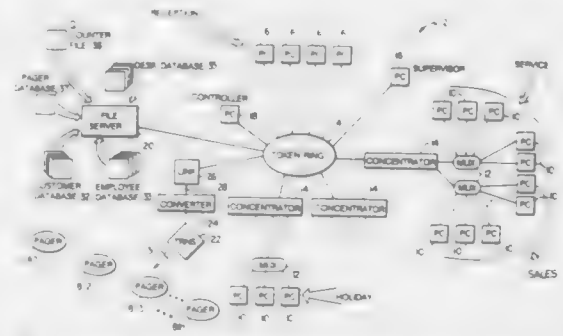
(a) placing representations corresponding to requests for access to said bus in said grant queue in an order determined by the state of said arbitration lines;

(b) maintaining a pipeline queue of bus transactions where a first bus transaction of a highest priority corresponding to one agent is assigned a highest priority slot in said pipeline queue and a second bus transaction of a next highest priority corresponding to another agent is assigned a next lower priority slot in said pipeline queue, to thereby order said bus transactions in said pipeline queue in a priority sequence;

(c) forcing a request packet to take a next available bus cycle upon the condition that there is an agent identified in said grant queue and said pipeline queue is not full;

(d) forcing a reply packet to take a next available bus cycle upon the condition that said pipeline queue is full;

(e) forcing a reply packet to take a next available bus cycle upon the condition that said grant queue is empty and said pipeline queue is not empty;



(f) returning said reply packets in said priority sequence that said bus transactions are ordered in said pipeline queue upon the condition that said reply deferral line is asserted by said one agent on said bus corresponding to said highest priority slot in said pipeline queue to thereby permit said another agent corresponding to a bus transaction in a next lower priority slot of said pipeline queue to gain access to said bus.

SERVICE ALLOCATION SYSTEM

Kenneth P. Wayne, Swampscott, and Jay P. Werb, Newton, both of Mass., assignors to Addax, Inc., Cambridge, Mass.

Filed Sep. 12, 1989, Ser. No. 406,157
Int. Cl.[5] G06F *15/21*
U.S. Cl. 364—401 34 Claims

20. A system for allocating service resources to a plurality of individuals who have requested services, the services being of a type requiring that the service resource and a receiver of the services come together at some common location, the system comprising:

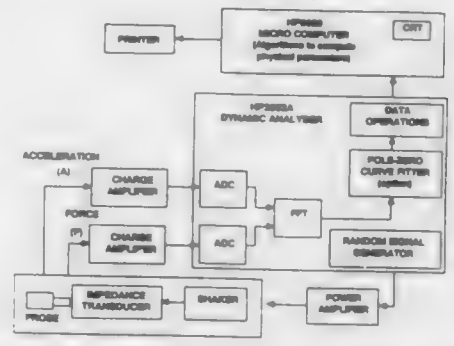
a plurality of handheld wireless communication devices, each one of said communication devices for assignment and transfer to a different one of said plurality of individuals;

assignment means for assigning each one of said plurality of individuals to a corresponding one of a plurality of queues;

computation means for computing an expected wait time for an assigned individual based upon that individual's position in the queue to which that individual is presently assigned, the expected wait time for an assigned individual being an estimate of how long that individual must wait before being notified that service is available;

indication means for indicating that a service resource is or will become available to serve a next individual;

selection means responsive to said indicating means for selecting the next individual from one of said plurality of queues; and



a wireless transmitter for communicating with the communication device assigned to the next individual so as to notify the next individual that a service resource is available.

5,006,984

BONE/TISSUE ANALYZER AND METHOD

Charles R. Steele, Stanford, Calif., assignor to Stanford University, Stanford, Calif.

Filed Mar. 10, 1987, Ser. No. 24,354
Int. Cl.[5] G06F *15/42*
U.S. Cl. 364—413.27 11 Claims

1. A computer-assisted method for determining bone cross-sectional bending stiffness in a subject, comprising

placing a vibratory unit against the region of the bone whose bending stiffness is to be determined,

exciting the vibratory unit, with such pressed against said bone region, in a frequency range substantially in the frequency range of 70–1,600 Hertz,

measuring the frequency-dependent mechanical response said bone region within such frequency range, and converting the response measurements to real and imaginary frequency-dependent force/displacement curves,

solving the equations of motion of a linear mechanical system (a) having a soft-tissue mass Ms, a soft-tissue spring constant Ks, soft-tissue damping factor βs, a bone mass Mb, a bone spring constant Kb, and a bone damping factor βb, and (b) characterized by a equation of motion having real and imaginary curves, and

by said solving, determining a value of K_b which corresponds to the bone bending stiffness in the excited bone region.

COMPUTER SYSTEM FOR MINIMIZING BODY DYSFUNCTIONS INDUCED BY JET TRAVEL OR SHIFT WORK

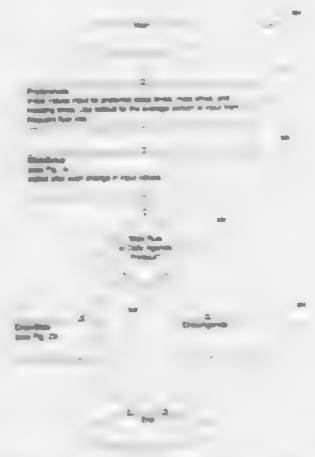
Charles F. Ehret, Hinsdale, Ill., and William T. Ashton, Jr., Woodside, Calif., assignors to Kinetic Software, Inc., Woodside, Calif.

Filed Jul. 15, 1988, Ser. No. 219,590
Int. Cl.[5] G06F *15/21, 15/42*
U.S. Cl. 364—413.01 26 Claims

1. A method of operating a general purpose computer to provide information to an individual to help the individual to reduce dysfunction caused by a particular trip across a plurality of time zones, the method comprising the steps of:

receiving itinerary data, the itinerary data including a trip departure time, a trip departure location, a trip destination location and a trip arrival time;

accessing a database of time zone information to determine the time zones of a plurality of locations in response to the trip departure location and the trip destination location;



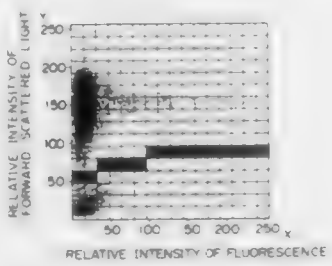
calculating a phase change between the departure and destination locations in response to the accessed time zone information;

determining a time shift day in response to the itinerary data and phase change;

determining a reference point on the time shift day;

using the reference point to generate daily recommendations of activity responsive to the itinerary data and the calculated phase change in accordance with chronobiological rules, the recommendations including a schedule for the

days surrounding the time shift day indicating sleep times, meal times, meal types, caffeine times, and a watch reset time; and



providing the daily recommendations of activity to the individual.

METHOD OF DEMARCATING TWO-DIMENSIONAL DISTRIBUTION

Takanobu Inoue, Hyogo, Japan, assignor to Toa Medical Electronics Co., Ltd., Kobe, Japan

Filed Dec. 5, 1988, Ser. No. 279,955
Claims priority, application Japan, Jun. 7, 1988, 63-140309
Int. Cl.[5] G06F *15/42;* **G01N** *21/64*
U.S. Cl. 364—413.08 **1 Claim**

1. A method of demarcating in a blood sample having a plurality of blood cell particles, a first particle group consisting of red blood cell particles and reticulocyte particles from a second particle group, said second particle group substantially free of red blood cell particles and reticulocyte particles by drawing a discriminant in a plot of a two-dimensional distribution prepared from signals indicative of fluorescence and scattered light detected from individual particles, comprising the steps of:

(a) preparing a specimen for measuring by mixing a sample of blood with a fluorescent dye solution, said dye solution comprising a fluorescent dye which is capable of dyeing at least said particles in said first particle group of said blood sample;

(b) introducing an aliquot of the specimen prepared in accordance with step (a), into a flow cell of a flow cytometer, irradiating particles of said aliquot of said specimen in said flow cytometer with a light of a wavelength that excites fluorescence of said fluorescent dye.

(c) measuring from said particles of said aliquot relative intensities of a fluorescence signal due to said fluorescent dye absorbed by said particles and relative intensities of a signal of scattered light from said wavelength of light;

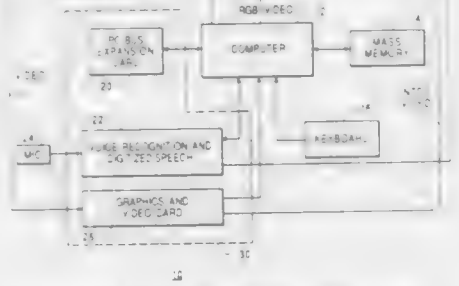
(d) plotting a two-dimensional distribution on the basis of relative intensities of fluorescence and relative intensities of scattered light.

(e) dividing the two-dimensional distribution into a plurality of grid-shaped areas in the plot and determining the number of particles contained in each area;

(f) selecting an area in the plot containing a minimum number of particles from a plurality of areas forming a specific column;

(g) selecting an area in the plot containing a minimum number of particles from areas, which are adjacent the area selected in said step (f), from among a plurality of areas forming a column neighboring said specific column;

(h) successively selecting an area in the plot containing a minimum number of particles from areas, which are adjacent the area selected in an immediately preceding column, in each column successively adjoining the neighboring column; and



(i) setting a representative point in each area in the plot selected in each column, obtaining an approximation curve by connecting each of the points, and adopting the approximation curve as a discriminant.

AUDIOVISUAL SYSTEM FOR SIMULATION OF AN INTERACTION BETWEEN PERSONS THROUGH OUTPUT OF STORED DRAMATIC SCENES IN RESPONSE TO USER VOCAL INPUT

William G. Harless, 4611 Glenbrook Pkwy., Bethesda, Md. 20814

Filed Mar. 25, 1986, Ser. No. 843,552
Int. Cl.[5] G06F *15/38*
U.S. Cl. 364—419 **29 Claims**

1. An interactive audiovisual system, comprising:

means for storing a plurality of prerecorded audio and video scene signals representative of dramatic scenes;

means for designating specific ones of said scene signals as type one, type two, type three, or type four scene signals respectively representing scenes for which relevant thoughts exist, scenes for which no relevant thoughts exists, scenes depicting relevant thoughts, and scenes depicting non-relevant thoughts, for associating each of type three scene signals with one of said type one scene signals, and for associating each of said type four scene signals with all of said type two scene signals;

voice recognition means for receiving a voice signal and for generating interrupt signals representative of the meaning of words contained in said voice signals;

audiovisual output means for providing audible and visual outputs representative of said scene signals;

logic means for selectively presenting specific ones of said scene signals to said audiovisual output means in response to interrupt signals, for responding to said interrupt signals during presentation of said type one scene signals to alter presentation of the type one scene signal being presented, initiate presentation of one of said associated type three scene signals, and resume presentation of the type one scene signal being presented, and for responding to said interrupt signals during presentation of said type two scene signals to alter presentation of the type two scene signal being presented, initiate presentation of one of said type four scene signals, and resume presentation of the type two scene signal being presented.

12. A method for providing an interactive drama, comprising the steps of:

storing a plurality of prerecorded scene signals representative of dramatic scenes;

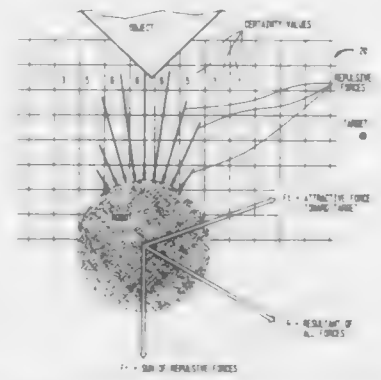
designating specific ones of said scene signals as type one, type two, type three, or type four scene signals respectively representing scenes for which relevant thoughts exist, scenes for which no relevant thoughts exist, scenes depicting relevant thoughts, and scenes depicting nonrelevant thoughts;

receiving voice input signals and generating interrupt signals representative of the meaning of words in said voice input signals;

associating said type three scene signals with specific ones of said type one scene signals;

selectively displaying specific ones of said stored dramatic scenes in response to said interrupt signals;

responding to selected ones of said interrupt signals during presentation of said type one scene signals to alter presentation of said type one scene signal being presented, initiate presentation of one of said associated type three scene signals, and resume presentation of said type one scene signal originally presented; and



responding to said selected ones of said interrupt signals during presentation of said type two scene signals to alter presentation of said type two scene signal being presented, initiate presentation of one of said associated type four scene signals, and resume presentation of said type two scene signal originally presented.

OBSTACLE-AVOIDING NAVIGATION SYSTEM

Johann Borenstein; Yoram Koren, and Simon P. Levine, all of Ann Arbor, Mich., assignors to University of Michigan, Ann Arbor, Mich.

Filed Apr. 28, 1989, Ser. No. 344,638
Int. Cl.[5] G06F *15/50*
U.S. Cl. 364—424.02 **32 Claims**

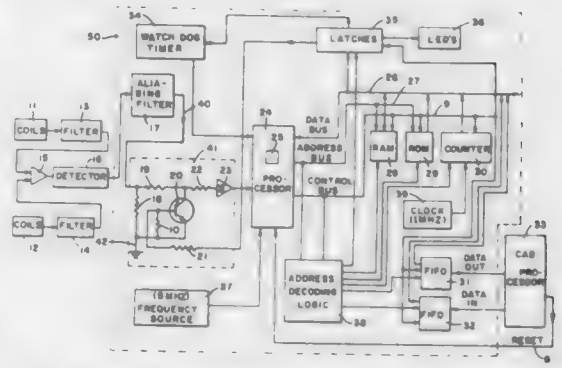
1. A method of operating a vehicle to avoid an obstacle in a field of operation, the method comprising the steps of:

installing in a first memory first data defining a first array of first grid cells, each for holding data corresponding to a respective value, said first grid cells in said first array corresponding to respective predetermined subfields in the field of operation;

scanning one of said subfields in the field of operation for determining the presence of an obstacle therein;

incrementing said value in a first grid cell in said first array corresponding to said scanned one of said subfields in response to a signal responsive to said step of scanning indicating a likelihood that an obstacle is present in said scanned one of said subfields;

defining a region of operation in the vicinity of the vehicle; and



computing a plurality of vectorial values, each vectorial value being responsive to the location of each first grid cell in said first array within said defined region of operation, with respect to the location of the vehicle, and said values in said first grid cells.

DIGITAL VITAL RATE DECODER

John W. Parker, Rochester, N.Y., assignor to General Signal Corporation, Rochester, N.Y.

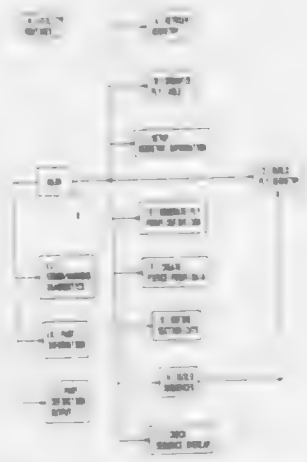
Continuation of Ser. No. 12,540, Feb. 9, 1987, abandoned. This application Jun. 12, 1989, Ser. No. 364,286
Int. Cl.[5] G06F *15/20;* **H03D** *3/18*
U.S. Cl. 364—426.05 **18 Claims**

1. In a railway signaling system in which rate code signals are propagated along rails, a vital digital system that decodes a plurality of different allowable rate code (speed) signals and receives vehicle parameters in order to specify a maximum safe speed that a railway vehicle can travel at different times along the rails, said system comprising:

(a) means on the railway vehicle which are coupled to said rails for detecting said rate code signals and providing output signals corresponding thereto;

(b) vital processing means operative in fixed cycles and responsive to said output signals for detecting said rate code signals, said processing means comprising computer means for simulating a plurality of digital filters for decoding said output signals and providing digital signals corresponding to the frequency differences therebetween;

(c) said vital processing means comprising means responsive to said digital signals for making a multiplicity of calculations thereon during each cycle for detecting whether said calculations are performed in certain sequence and said rate code signals are valid and for providing control signals said vehicle indicative of an unsafe condition when the absence of an allowable rate signal is not detected; and



wherein said processing means provides said digital filters as infinite impulse response filters having outputs which will always differ by a constant magnitude and verifies that said output signals correspond to said allowable rate code signals and said digital filters are vital in operation.

METHOD AND APPARATUS FOR THE DESIGN AND CONSTRUCTION OF COMPOSITE PARTS

William E. Ward, Issaquah, and Jack R. Gumm, Jr., Auburn, both of Wash., assignors to The Boeing Company, Seattle, Wash.

Continuation of Ser. No. 270,310, Nov. 10, 1988, abandoned, which is a continuation of Ser. No. 37,141, Apr. 10, 1987, Pat. No. 4,849,913. This application Sep. 29, 1989, Ser. No. 415,449
Int. Cl.[5] G06F *15/46*
U.S. Cl. 364—768 4 Claims

1. A system to aid in the design and manufacture of composite parts, the composite parts fabricated from a plurality of plies of material assembled and cured in a desired orientation and arrangement to form the part, the system comprising:

a central processing unit;

input means communicating with the central processing unit;

storage means communicating with the central processing unit;

means for inputting and storing information regarding the shape, orientation and location of the plies within the composite part;

means for isolating and defining individual plies within the part; and

means automatically communicating with the isolation and definition means for generating tool path data for a numerically controlled cutting machine or the like for cutting a plurality of individual plies of nonuniform shape from a sheet of ply material, the generating means taking into account the shape of each ply and its desired orientation with respect to the composite material.

5,006,991

METHOD FOR MAKING OF DESIGN REFERENCE AND APPARATUS THEREFOR

Shigeru Obcoshi, Takahagi, and Toshiaki Yoshinaga, Hitachi, both of Japan, assignors to Hitachi, Ltd., Tokyo, Japan

Continuation of Ser. No. 929,894, Nov. 13, 1986, abandoned. This application Jan. 9, 1990, Ser. No. 463,005
Claims priority, application Japan, Nov. 14, 1985, 60-253767
Int. Cl.[5] G06F *15/62*
U.S. Cl. 364—474.2 22 Claims

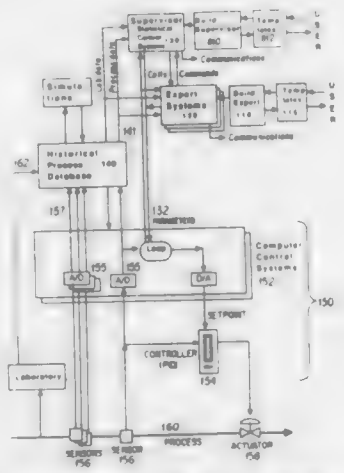
17. An apparatus for making a design reference comprising:

an input device;

a first memory for storing design object data;

a second memory for storing steps of selecting from said first memory design object data for a design object designated by said input device, preparing first information for displaying said design object using the selected design object data, preparing second information for displaying an interference check element designated by said input device and moving said interference check element relative to said design object to detect an interference between said interference check element and said design object;

processing means connected to said input device and said first and second memory for selecting design object data designated by said input device, preparing said first information, preparing said second information and moving said interference check element relative to said design object to detect an interference between said interference check element and said design object in accordance with said steps stored in said second memory; and



a displaying device connected to the processing means for displaying said first information, said second information and said moving of said interference check element relative to said design object as prepared and performed by said processing means.

5,006,992

PROCESS CONTROL SYSTEM WITH RECONFIGURABLE EXPERT RULES AND CONTROL MODULES

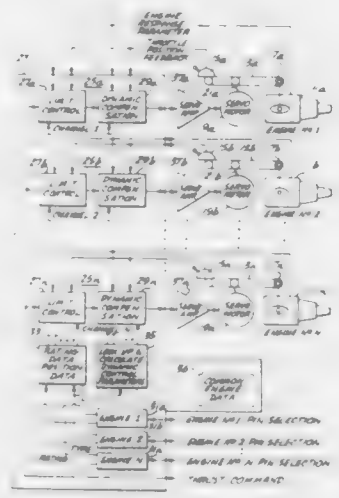
Richard D. Skeirik, Newark, Del., assignor to DuPont De Nemours and Company, Wilmington, Del.

Filed Sep. 30, 1987, Ser. No. 103,014
Int. Cl.[5] G06F *15/18*
U.S. Cl. 364—513 81 Claims

1. A computer-based method for operating a substantially continuous process, comprising the steps of:

(1) operating the process with one or more sensors connected to sense conditions in the process, and one or more actuators connected to change conditions in the process;

(2) controlling one or more of said actuators with a process controller in accordance with signals received directly from one or more of said sensors and in accordance with one or more control parameters; and



(3) running a process supervisor procedure, comprising one or more software modules, for selectively defining one or more of said control parameters for said process controller, said process supervisor procedure also calling on at least one expert subprocedure which uses a knowledge base and inference structure relevant to the process.

5,006,993

AUTOMATIC THROTTLE CONTROLLER FOR AIRCRAFT WITH INTERMIXED ENGINES

Daniel R. Virnig, Bellevue; Douglas O. Jackson, Mercer Island, and Frederick C. Blechen, Redmond, all of Wash., assignors to The Boeing Company, Seattle, Wash.

Filed Nov. 18, 1988, Ser. No. 273,297
Int. Cl.[5] G06F *15/20*
U.S. Cl. 364—431.01 26 Claims

1. An automatic throttle controller for producing thrust control signals for aircraft with intermixed engines, said automatic throttle controller comprising:

identification means for producing a code that identifies each side-mounted engine on an aircraft;

processing means coupled to said identification means for receiving said engine identification code produced by said identification means and producing related parameter data for each engine based on said identification code; and,

channel means coupled to said processing means for receiving said parameter data and producing a separate thrust control signal for each engine based on the parameter data associated with the related engine.

5,006,994

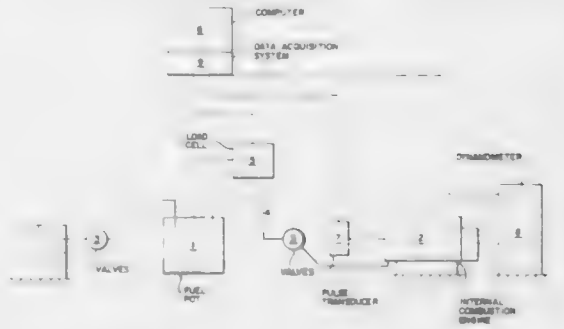
METHOD FOR DETERMINING THE SPECIFIC FUEL CONSUMPTION OF AN INTERNAL COMBUSTION ENGINE AND APPARATUS THEREFOR

Kjell Andersson, Stenstorp, and Lennart Eriksson, Köping, both of Sweden, assignors to ASE Europe AB, Arboga, Sweden

Filed Apr. 19, 1989, Ser. No. 340,227
Claims priority, application Sweden, Apr. 19, 1988, 8801443
Int. Cl.[5] G01F *9/00*
U.S. Cl. 364—442 2 Claims

2. A method for performing a measurement of a specific fuel consumption of an internal combustion engine, the method comprising the steps of:

obtaining respective signals from a plurality of sensors indicative of engine speed, engine torque and a change in weight of a pot containing fuel to be consumed by the engine;



passing said signals through a conditioning system and then to a computer;

continuously recording and storing in the computer, during a measuring period, the change in weight of the fuel pot and a number of revolutions of an engine shaft;

programming the computer for performing said measurement of the specific fuel consumption at constant engine speed and engine torque, within selectable, preset limits of tolerance of said engine speed and engine torque during said measuring period, which can be varied in small increments of 0.5 second to achieve maximum accuracy;

terminating said measurement and starting a new measurement of the specific fuel consumption when the engine speed or torque exceeds the preset limits during the measurement period;

calculating a linear fuel consumption curve as a function of time with said computer by a least-squares method utilizing said change in weight, as well as calculating a mean torque and a mean speed, after the measurement period and provided the engine speed and torque are constant within the preset limits;

disqualifying said measurement and starting a new measurement of the specific fuel consumption when said mean speed or said mean torque exceeds said limits of said tolerance, or if any stored tabulated value from said curve is greater than a predetermined value: and,

calculating with the computer the fuel consumption per piston stroke based on the fuel consumption curve, the measuring period, the number of revolutions of the engine shaft during the measuring period and the number of cylinders, whereby a statistical certainty of the measurement of the specific fuel consumption can be specified.

5,006,995

AUTOMATIC WEIGHING PLANT FOR DYES IN POWDER FORM

Fabrizio Toschi, Breganze, and Fabio Toschi, Carpi, both of Italy, assignors to Color Service S.R.L., Fara Vicentino, Italy

Continuation of Ser. No. 116,958, Nov. 5, 1987, abandoned. This application Jan. 22, 1990, Ser. No. 465,646
Claims priority, application Italy, Apr. 22, 1987, 85115 A/87
Int. Cl.[5] G06F *15/46;* G01G *19/22*
U.S. Cl. 364—468 8 Claims

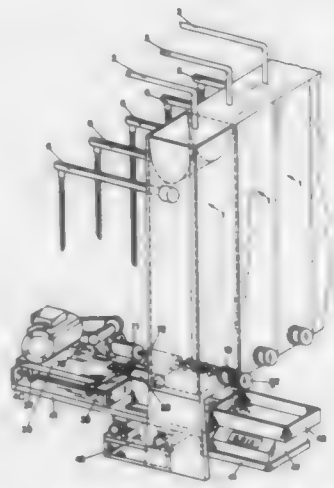
1. A weighing plant for use with a computer system for the weighing of dyes in powder form for the purpose of preparing dye mixtures, which comprises

a plurality of loading hoppers,

a plurality of dye drums adapted to contain dye in powder form,

a pipe system providing communication between each of the dye drums and corresponding loading hoppers,

a vacuum system for drawing the dye from the dye drums, through the pipe systems and into the loading hoppers,



a conveyor chute rotatably disposed within the lower portion of the loading hopers, said conveyor chute extending from the inside to the outside of the loading hopper for removing the dye powder therefrom,

an electronic scale for selectively moving in logic succession under the loading hoppers for weighing the dye color removed from each of the loading hoppers, and

motor transmission means for moving from one loading

hopper to another for operatively and relatively engaging the conveyor chutes of respective loading hoppers,

said computerized system controlling the logical succession of displacement of the electronic scale under each loading

hopper, and the speed and duration of rotation of each conveyor chute whereby a dye mixture is obtained in accordance with the instructions introduced by the operator.

5,006,996

SYSTEM OF CONVEYING, STORING, RETRIEVING AND DISTRIBUTING ARTICLES OF MANUFACTURE

Katsunari Nakamura; Keiichiro Ueda; Yoshirou Irie; Toyokazu Hoshi, and Motozo Kawakami, all of Kanagawa, Japan, assignors to Fuji Electric Co., Ltd., Kanagawa, Japan

Filed Mar. 20, 1989, Ser. No. 326,130

Claims priority, application Japan, Mar. 26, 1988, 63-72793; Jun. 17, 1988, 63-149771

Int. Cl.[5] **G06F** *15/46;* **B65G** *63/00*

U.S. Cl. 364—478 **3 Claims**

1. A physical distribution system comprising:

at least one article storage shelf for storing article carrying units each carrying an article;

an article conveying unit, having a terminal unit, for conveying said article to and from said article storage shelf;

a first memory unit capable of storing and retrieving without contact data relating to said article from said terminal unit of said article conveying unit, said first memory unit being provided to said article carrying unit;

a second memory unit capable of retrieving without contact data relating to an address of said article storage shelf from said terminal unit, said second memory unit being provided to said article storage shelf; and

a remote data processing unit for transferring and processing the data relating to the storage/removal of said article between said article conveying unit and said terminal unit to control storage condition of said articles in said article storage shelf, wherein during conveying said article in a warehouse, said terminal unit of said article conveying unit reads out the data relating to said article, which has been stored in said first memory unit to be transmitted and stored in said data processing unit, the data relating to the address of said article storage shelf to which said article carrying unit is placed is transmitted to said terminal unit to thereby move said article conveying unit to an aimed shelf arrival of said conveying unit to the aimed shelf, data, and upon arrival of said conveying unit to the aimed shelf, the address data of said shelf which has been stored in said second memory unit is read out to be subjected to comparison with the shelf address data from said data processing unit to thereby ensure that the data stored in said data processing unit and said article on said storage shelf coincide with each other.

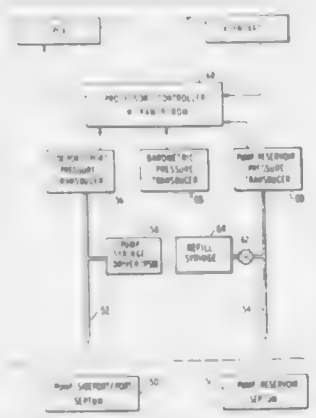
PUMP DIAGNOSTIC SYSTEM



Sanford Reich, Providence, R.I., assignor to Shiley Infusaid, Inc., Norwood, Mass.

Continuation of Ser. No. 133,409, Dec. 15, 1987, abandoned.

This application Feb. 26, 1990, Ser. No. 484,284

Int. Cl.[5] **A61M** *5/00*

U.S. Cl. 364—510 **22 Claims**

21. A system for evaluating operating of an in-vivo medication delivery device having an access port and an outlet comprising:

means in fluid communication with said device for determining a steady state in-vivo pressure in said device,

means in fluid communication with said device for generating a pressure disturbance pulse in said device and determining a decay time thereof, and

means responsive to said means for determining a steady state in-vivo pressure and said means for generating a pressure disturbance for determining whether said device is functioning within predetermined limits.

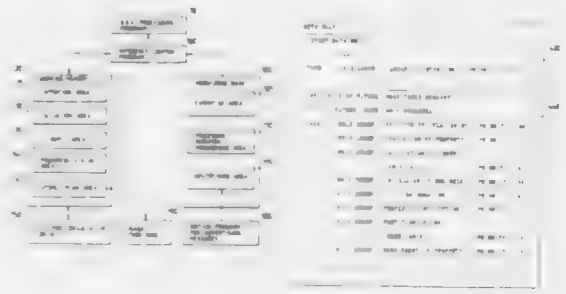
5,006,998

COMPUTER SYSTEM WITH EASY INPUT MEANS FOR CONSULTATION

Chizuko Yasunobu; Fumihiko Mori, both of Yokohama; Hideo Ohata, Machida; Mari Udagawa, Nagareyama; Keiichiro Inaba, Musashino; Kenichi Hida, Kashiwa, and Yumiko Satoh, Kawasaki, all of Japan, assignors to Hitachi, Ltd., Tokyo, Japan

Filed Nov. 2, 1988, Ser. No. 266,401

Claims priority, application Japan, Nov. 5, 1987, 62-279877; Nov. 14, 1987, 62-286439



Int. Cl.[5] **G06F** *15/20, 7/28*

U.S. Cl. 364—513 **21 Claims**

1. In a computer system for consultation comprising a computer having an inference engine and a memory for storing a knowledge base, the improvement wherein:

said knowledge base memory includes a first area for storing expertise in the field of the consultation and a second area for storing processing know-how relating to a processing of the consultation;

said inference engine includes a work memory for storing facts clarified in an inference process, status of a client, intention of the client, a reply to the client and progress status of the consultation;

said first area includes advice rules, each of which has a premise condition part and a reply generation part;

said premise condition part includes statements of the status of the client, the intention of the client, and the progress status of the consultation; and

said inference engine comprises means for selecting a reply in accordance with the status of the client, the intention and the progress status, and means for offering the selected reply to the client.

5,006,999

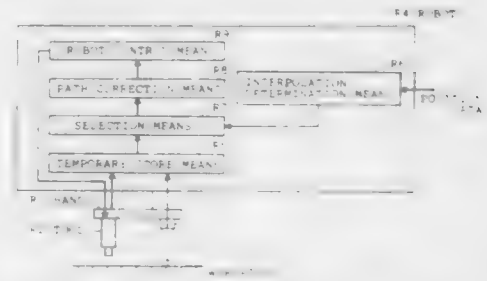
REAL-TIME ROBOT CONTROL SYSTEM TRACKING BASED ON A STANDARD PATH

Toshitaka Kuno, Nagoya; Mitsuo Koide, Owariasahi; Masaru Nakano, Nagoya; Chisao Hayashi; Yoshito Kato, both of Aichi, and Yasuo Ishiguro, Toyota, all of Japan, assignors to Toyota Jidosha Kabushiki Kaisha, Toyota and Kabushiki Kaisha Toyota, Aichi, both of, Japan

Filed Mar. 31, 1989, Ser. No. 331,318

Claims priority, application Japan, Apr. 1, 1988, 63-81787

Int. Cl.[5] **G05B** *19/00*



U.S. Cl. 364—513 **14 Claims**

1. A control system for an industrial robot that tracks a work-shape by moving on a standard path which is determined from position data previously stored in the system, and that has a hand with a tool and a work-shape sensor which is located a predetermined distance in front of the tool and that corrects deviations from the standard path in real-time while the tool is operating, the system comprising:

temporary storage means for receiving sensed data obtained when the tool operates, and for calculating and storing work-shape data using the sensed data;

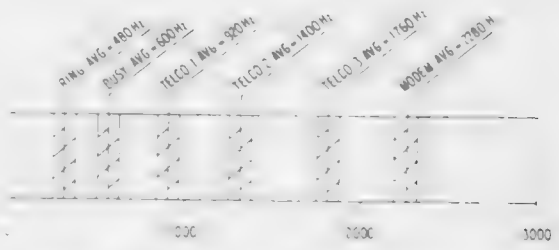
interpolation determination means for selecting an interpolated point on the standard path as a target position for the tool;

selection means for generating a reference point corresponding to the interpolated point on the standard path, and for selecting the work-shape data that is closest to the reference point;

path correction means for generating target position and posture data for the tool based on the work-shape data from the selection means; and

robot control means for controlling the tool to trace a series of points corresponding to the target position and posture data from the path correction means.

5,007,000



CLASSIFICATION OF AUDIO SIGNALS ON A TELEPHONE LINE

Charles A. Baldi, Loudon County, Va., assignor to International Telesystems Corp., Herndon, Va.

Filed Jun 28, 1989, Ser. No. 373,281

Int. Cl.[5] **G01L** *5/00*

U.S. Cl. 364—513.5 **21 Claims**

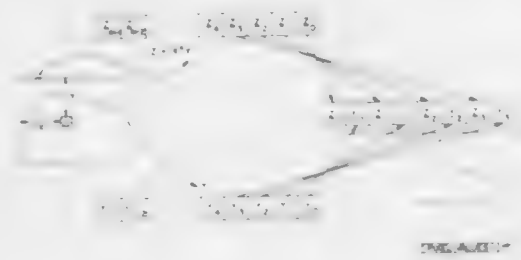
1. A method of classification of audio signals, including call progress tones and voice, on a telephone line comprising the steps of:

sampling an audio signal by counting the number of zero crossings of the signal during a predetermined time period to generate a first value;

using said first value as an index into a first array in which are stored band numbers corresponding to a plurality of possible values to produce a band number corresponding to said first value;

addressing with said band number of second array in which are stored counts corresponding to said band numbers to increment a count corresponding to said band number;

testing said count to determine if a threshold is exceeded to classify the audio signal as a call progress tone; and



examining a number of bands and directions of changes of bands to classify the audio signal as voice.

5,007,001

METHOD FOR REORDERING THE PIXEL MAP OF A DIGITIZED IMAGE

Andrew Lloyd-Williams, 6 High View Dr., High Bridge, N.J. 08829

Filed Jan. 24, 1990, Ser. No. 469,340
Int. Cl.[5] G06F *3/14*
U.S. Cl. 364—518 20 Claims

1. A computer-implemented method of reordering a pixel map of a multi-dimensional digitized image to provide a new pixel order which approximates to a situation in which any contiguous subset of the reordered pixel map represents all regions of the image, with broader detail being depicted first, followed by increasingly fine detail, the method comprising:

(a) establishing a coordinate system and an origin for that coordinate system which provides for each pixel displacement coordinates represented by a set of positive integer values, each pixel being represented by only one such set of values and each set of coordinate values representing at most one pixel position;

(b) for each pixel in the image:

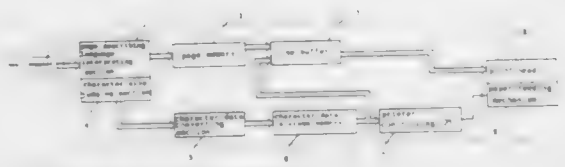
(i) establishing attributes of the pixel;

(ii) establishing a position within the overall image, and representing this position in the form of a set of coordinates relative to the origin;

(iii) converting each coordinate value in said set of coordinates to a binary repreesentation of 0's and 1's, with the inclusion of leading zeroes to ensure that all representations of that coordinate are of equal length;

(iv) for each coordinate in the set of coordinates, reversing the bit stream thus formed;

(v) interleaving the reversed bit streams representing each coordinate in a bit-wise fashion to form a pixel sequence number;



(c) reordering the storage or transmission of the attribute values corresponding to each pixel in the order of ascending pixel sequence numbers.

5,007,002

SERIAL OR LINE PRINTER ADAPTED FOR USE WITH PAGE DESCRIBING LANGUAGE

Mamoru Imaizumi, Nagoya, and Yasutada Aoyama, Ikezawa, both of Japan, assignors to Brother Kogyo Kabushiki Kaisha, Aichi, Japan

Filed Jul. 3, 1990, Ser. No. 547,179
Claims priority, application Japan, Jul. 11, 1989, 1-179799
Int. Cl.[5] G06K *15/00*
U.S. Cl. 364—519 18 Claims

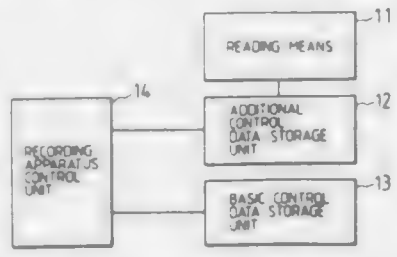
1. A serial printer comprising:

a print means for printing one line of stored print data on a print medium for each scanning stroke of the print means;

a feed means for feeding the print medium in a direction perpendicular to a moving direction of the print means;

a first judging means for judging whether or not character data are in the print data;

a second judging means for judging whether or not there exists in the character data judged by the first judging means character data with a character size which is printable in one scanning stroke of the print means; and



a control means for controlling the print means so as to print the character data judged by the second judging means in one scanning stroke of the print means by adjustment of a printing amount of the character data by the print means and a feeding amount of the print medium by the feed means.

RECORDING APPARATUS

Takanobu Suzuki, and Tsutomu Furusawa, both of Kanagawa, Japan, assignors to Fuji Xerox Co., Ltd., Tokyo, Japan

Division of Ser. No. 206,850, Jun. 15, 1988. This application Nov. 21, 1989, Ser. No. 439,947
Claims priority, application Japan, Jun. 15, 1987, 62-147159; Jun. 15, 1987, 62-147160; Jun. 15, 1987, 62-147161; Sep. 2, 1987, 62-217898
Int. Cl.[5] G06F *9/00*
U.S. Cl. 364—519 11 Claims

1. A recording apparatus comprising;

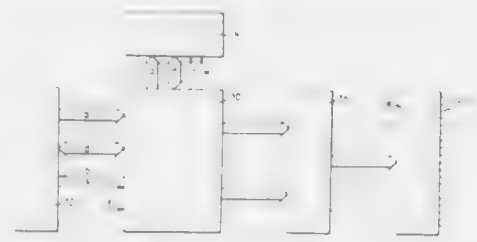
a recording apparatus body to which additional devices can be fitted;

storage means for storing programs for controlling said additional devices;

additional device identifying means for identifying the kinds of additional devices fitted to said recording apparatus body, said additional devices being ready for operation;

program selecting means for making effective said programs for said additional devices identified by said additional device identifying means as being ready for operation; and

a control unit for controlling said recording apparatus using said programs selected by said program selecting means and a program for controlling said recording apparatus body.



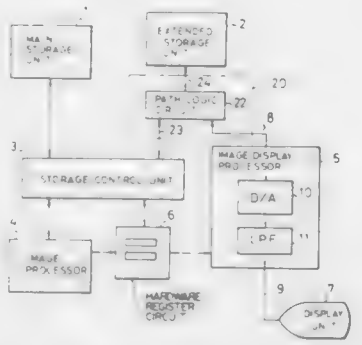
5,007,004

CONTROL CIRCUIT FOR POINT-GENERATING UNITS OF A WRITE HEAD

Sven Palmgren, Täby, and Ove Tedenstig, Märsta, both of Sweden, assignors to Facit AB, Sundbyberg, Sweden

Filed Jan. 23, 1990, Ser. No. 468,878
Claims priority, application Sweden, Apr. 6, 1989, 8901216
Int. Cl.[5] G06K *15/00*
U.S. Cl. 364—519 8 Claims

1. A circuit for controlling point-generating units of the write head (**18**) of a printer, said circuit (**10**) forming an interface between a central unit (**12**), an external direct access memory (RAM; **14**), and a driver stage (**16**) for activating the write head (**18**), characterized in that the circuit includes a control module (**26**) by means of which address coding, internal data buses, a command register incorporated in the control module and a test logic unit incorporated in said control module can be controlled, and further including a pixel buffer module (**28**) which, when required, maintains a buffer memory incorporated therein filled with pixel data, said control module (**26**) and pixel buffer module (**28**) being connected to the central unit (**12**), and further including a rotation module (**32**) which is connected electrically to the direct access memory (**14**) and which is intended to determine the format of input pixel data for a data flow regulated to the point geometry of the write head (**18**).



5,007,005

DATA PROCESSING SYSTEM

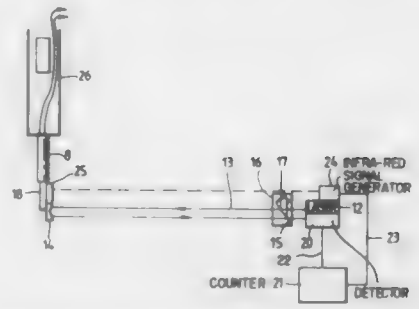
Yasuhiko Hatakeyama, and Tomoo Aoyama, both of Hadano, Japan, assignors to Hitachi, Ltd., Tokyo and Hitachi Computer Engineering Co., Ltd., Kanagawa, both of, Japan

Filed Mar. 28, 1989, Ser. No. 329,556
Claims priority, application Japan, Mar. 28, 1988, 63-73887
Int. Cl.[5] G06K *1/00*
U.S. Cl. 364—521 9 Claims

1. A data processing system comprising:

an image processor for generating animating image data for each of a plurality of screens and writing said animating image data in a screen buffer memory;

an image display processor for reading said animating image data from said screen buffer memory and generating a display screen graphic signal to be supplied to a display unit; and



a hardware register circuit for updating data of a screen read-out control register in synchronization with each of a write operation of animating image data from said image processor and a read operation of animating image data to said image display processor.

5,007,006

METHOD OF AND APPARATUS FOR CALIBRATION OF MACHINES

Benjamin R. Taylor, Trelleck; Mark A. V. Chapman, and Jeffrey Gr.ham, both of Wotton-Under-Edge, all of United Kingdom, assignors to Renishaw plc, Gloucestershire, England

PCT No. PCT/GB88/00167, § 371 Date Oct. 25, 1988, § 102(e) Date Oct. 25, 1988, PCT Pub. No. WO88/06714, PCT Pub. Date Sep. 7, 1988
PCT Filed Mar. 7, 1988, Ser. No. 264,968
Claims priority, application United Kingdom, Mar. 6, 1987, 8705301
Int. Cl.[5] G01B *11/00*
U.S. Cl. 364—571.05 19 Claims

19. A calibration device for use with a machine having parts which are relatively movable in three orthogonal directions for positioning a tool relative to a workpiece, and having measuring devices positioned between the relatively movable parts for measuring the movements of the respective parts in said directions, said calibration device comprising:

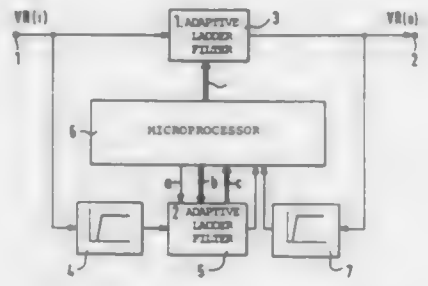
interferometric measuring means positioned in relation to the machine for providing a measurement of a movement of a machine part in at least one of said directions independently of, and in addition to, the measurement being made of said movement by any of said measuring devices,

means for generating from the measurements made by the interferometric measuring means signals corresponding to distance intervals moved by said moving machine part,

means for transmitting said signals to the machine to initiate recording of the measurements of the movement of said moving machine part made by the measuring devices of the machine, and

means for comparing the distance intervals between the recorded measurements made by the measuring devices of the machine with the predetermined distance intervals between said output pulses, and for providing an indication of any difference between them as an error map of the machine measurements.

5,007,007



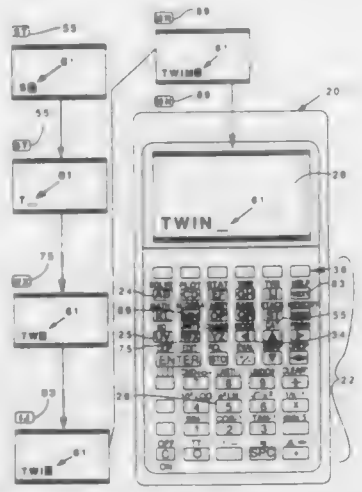
CIRCUITRY FOR CONVERTING A MEASUREMENT SIGNAL DISTURBED BY A DISTURBANCE FUNCTION INTO AN UNDISTURBED SIGNAL

Anton van Zanten, Ditzingen, and Friedrich Kost, Kornwestheim, both of Fed. Rep. of Germany, assignors to Robert Bosch GMBH, Stuttgart, Fed. Rep. of Germany

PCT No. PCT/EP87/00484, § 371 Date Apr. 7, 1989, § 102(e) Date Apr. 7, 1989, PCT Pub. No. WO88/02954, PCT Pub. Date Apr. 21, 1988
PCT Filed Aug. 26, 1987, Ser. No. 348,001
Claims priority, application Fed. Rep. of Germany, Oct. 8, 1986, 3634239
Int. Cl.[5] G06F *15/31*; H03F *1/26*; G06G *7/00*
U.S. Cl. 364—574 2 Claims

1. Anti-lock brake control system having means for converting an input measurement signal $V_{R(i)}$, which is disturbed at least occasionally by a disturbance function, into an undisturbed, output signal $V_{R(o)}$, said system comprising, in combination:

(a) a first digital adaptive ladder filter, having variable filter parameters and coupled to receive said input signal $V_{R(i)}$, for producing a filtered output signal $V_{R(o)}$ in which a disturbance signal is suppressed;
(b) a first high pass filter coupled to receive said input signal $V_{R(i)}$;
(c) a second digital adaptive ladder filter, having variable filter parameters and coupled to said first high pass filter downstream thereof; and



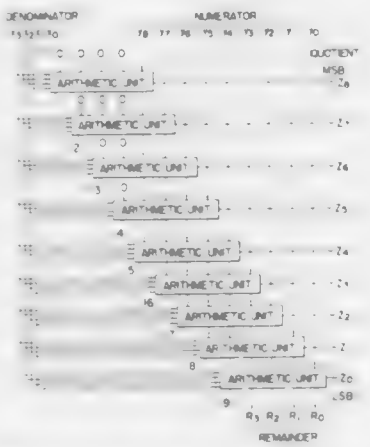
(d) control means, coupled to said first and second digital adaptive ladder filters, for switching said second adaptive filter to the adaptation mode in response to undershooting a wheel acceleration threshold after a pressure reduction, whereupon said second filter determines the filter parameters necessary for suppression of the disturbance function, and for transferring the filter parameters so determined from said second adaptive filter to said first adaptive filter.

5,007,008

METHOD AND APPARATUS FOR SELECTING KEY ACTION

Theodore W. Beers, Corvallis, Oreg., assignor to Hewlett-Packard Company, Palo Alto, Calif.

Continuation of Ser. No. 285,834, Dec. 15, 1988, abandoned. This application Aug. 17, 1990, Ser. No. 569,269
Int. Cl.[5] G06F *3/00*
U.S. Cl. 364—709.15 11 Claims



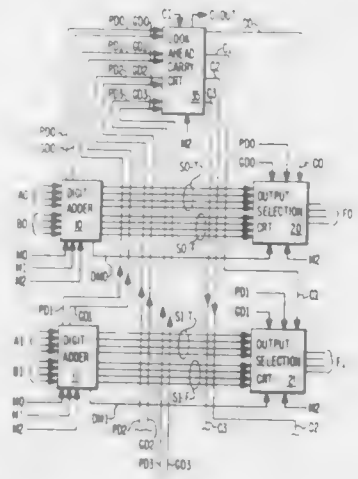
1. Apparatus for selecting key actions to be performed, comprising:
a pressable key for selecting between two key actions associated with the key;
means responsive to a predetermined pattern of pressing the key during a pending time period for determining which of the key actions is selected to be performed, said pending time period beginning with an initial press of the key;
a pair of symbols positioned adjacent to the key, each symbol representing a key action;
a display for displaying a symbol associated with a selected key action; and
means for causing the display to display to first symbol of the pair in response to the initial key press to indicate which key action will be performed if a predetermined key pressing pattern is not detected during the pending period, said means causing the second symbol to be displayed in place of the first if the predetermined pattern is detected during the pending period.

5,007,009

NON-RECOVERY PARALLEL DIVIDER CIRCUIT

Akihiro Azetsu, Suginami, Japan, assignor to Indata Systems Kabushiki Kaisha, Tokyo, Japan

Filed Nov. 18, 1988, Ser. No. 272,899
Claims priority, application Japan, Nov. 30, 1987, 62-302823
Int. Cl.[5] G06F *7/52*
U.S. Cl. 364—764 8 Claims



1. A dividing circuit which comprises:
an inversion circuit which inverts received denominator data x into $-x$;
a most significant arithmetic unit which receives as input the most significant bit Y_m of numerator data Y and said denominator data x and which determines a quotient $Z_m=1$ when $Y_m<0$ with a remainder $R_m=Y_m-x$ and a quotient $Z_m=0$ if $Y_m\geqq 0$ with a remainder $R_m=Y_m$;
a plurality of plural digit arithmetic units which are disposed so as to follow said most significant arithmetic unit and which are disposed in such a way that each plural digital arithmetic unit receives as an input thereto a remainder R_i of a preceding digit arithmetic unit and one bit Y_s in sequence out of the second most significant bit to the least significant bit, and receives as an input thereto said denominator data x and its inverted data $-x$, and determines the remainder $R_s=Y_s+x$ when $Y_s<0$ and the remainder $R_s=Y_s-x$ otherwise, and determines a quotient as $Z_i=1$ when $R_s\geqq 0$ and as $Z_i=0$ otherwise; and
a remainder processing circuit which receives as an input thereto the remainder data R_s of said digit arithmetic unit of the least significant digit and said denominator data x, and which controls the addition of said remainder data R_s to said denominator data x in correspondence with the most significant bit of said remainder data R_s, and which determines the result of the addition as a remainder of y/x, and wherein said quotient Z_m from said most significant arithmetic unit and each of said quotients Z_i from said plurality of digit arithmetic units are regarded as bit data of a quotient of y/x.

FAST BCD/BINARY ADDER

Laurence P. Flora, Covina, Calif., assignor to Unisys Corp. (Formerly Burroughs Corp.), Detroit, Mich.

Continuation of Ser. No. 696,831, Jan. 31, 1985, abandoned. This application Mar. 25, 1986, Ser. No. 844,488
Int. Cl.[5] G06F *7/50*
U.S. Cl. 364—771 9 Claims

1. Arithmetic logic means for selectively performing binary or BCD operations on two digital multi-bit operands applied thereto, said arithmetic logic means comprising:
means for receiving a mode signal indicative of whether binary or BCD operation is to be performed;
input logic circuit means to which said operands are applied for producing corresponding pairs of propagate and generate signals;
said input logic circuit means including binary arithmetic logic and BCD correction logic which are merged to provide for operation in response to said input operands and said mode signal so that, when BCD operation is indicated, correction logic operations are performed concurrently with arithmetic operations in a manner such that the propagate and generate signals produced take into account any inter-bit effects occurring because of correction logic operations; and
means responsive to said propagate and generate signals for producing a binary or BCD arithmetic result in dependence upon said mode signal.

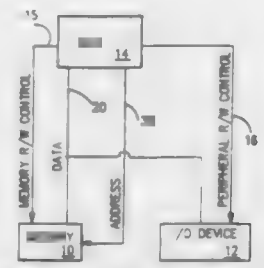
DATA STORAGE DEVICE INCLUDING DATA ADDRESS PREDICTING FUNCTION

Noboru Murayama, Tokyo, Japan, assignor to Ricoh Company, Ltd., Japan

Filed Aug. 4, 1986, Ser. No. 892,869
Claims priority, application Japan, Aug. 10, 1985, 60-176100
Int. Cl.[5] G06F *1/00*
U.S. Cl. 364—900 9 Claims

1. A storage device having an incoming address bus for receiving incoming memory address signals, and an outgoing data bus, said storage device comprising:
memory means including a plurality of addressable locations, each of said locations for storing a piece of data;
a plurality of registers for temporarily holding data read out of said locations of said memory means;
address-reading means for sequentially reading incoming memory address signals appearing on the address bus, said incoming memory address signals representing actual addresses in said memory means;
address-predicting means for comparing a current one of said incoming memory address signal with a prior one of said sequentially read incoming address signals in a predetermined manner and producing a future memory address prediction based on said comparison;
pre-read control means, operative absent a memory read command, for generating a pre-read control signal;
data reading means, responsive to said pre-read control signal, for reading data out of a certain of said addressable locations and storing said data in said registers, said data reading means further comprising a quantity of address latch means, the quantity being the same as the quantity of said registers, each address latch means adapted for storing a future memory address which identifies an address of data stored in a corresponding one of said registers;



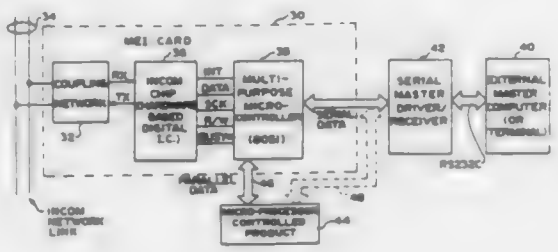
read control means for determining if any of said incoming read addresses coincide with an address corresponding to data stored in one of said registers; and
delivering means, responsive to said memory read command, for delivering data from said registers to said outgoing data bus when any of said incoming addresses is the same as the address identifying said data stores in said registers, and for delivering data from said locations of said memory means when any of said incoming addresses are not the same as the address identifying said data stored in said registers.

5,007,012

FLY-BY DATA TRANSFER SYSTEM

Vineet Dujari, Santa Clara, Calif., assignor to Advanced Micro Devices, Inc., Sunnyvale, Calif.

Filed Sep. 9, 1988, Ser. No. 242,744
Int. Cl.[5] G06F *13/00*
U.S. Cl. 364—900 28 Claims



1. A method for transferring data in one access cycle between two devices over a data communications bus, the steps comprising:
(a) performing a read operation to read data from a predetermined location in a first device;
(b) latching said data into a temporary register while writing said data into a predetermined location in a second device; and
(c) terminating the read operation of said first device and providing said data from said temporary register to said second device so that said data is available to said second device after said first device no longer supplies said data to said second device.

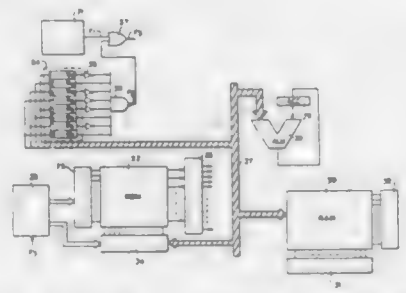
BIDIRECTIONAL COMMUNICATION AND CONTROL NETWORK WITH PROGRAMMABLE MICROCONTROLLER INTERFACING DIGITAL ICS AND CONTROLLED PRODUCT

Robert T. Elms, Monroeville Boro, Pa., assignor to Westinghouse Electric Corp., Pittsburgh, Pa.

Filed Apr. 1, 1986, Ser. No. 847,404
Int. Cl.[5] G06F *13/36, 13/42, 15/46, 15/56*
U.S. Cl. 364—900 42 Claims



1. In a bidirectional communication and control network which includes a common link and a plurality of hardware based digital ICs coupled to said common link to receive a network message transmitted over said link from a network master and to store said received network message, the combination of, a programmable microcontroller controller to one of said digital ICs and having means for reading said received network message stored in said one digital IC and storing said network message, a controlled product connected to said microcontroller through a parallel data bus such that the microcontroller is disposed between said one digital IC and said controlled product, and means for supplying said network message stored in said microcontroller to said controlled product over said parallel data bus, a group of control lines interconnecting said microcontroller and said controlled product, and means in said microcontroller for placing a predetermined segment of said network message stored in said microcontroller on said parallel data bus and producing an output strobe signal on a first one of said control lines, said controlled product producing an output acknowledge signal indicating the completion of a transfer of said predetermined segment thereto, said microcontroller including means responsive to said output acknowledge signal for deactivating said output strobe signal, said controlled product deactivating said output acknowledge signal when said output strobe signal is deactivated, said microcontroller including means responsive to said deactivation of said output acknowledge signal for placing another predetermined segment of said network message on said parallel data bus and producing an output strobe signal on said one control line.

RESET CIRCUIT FOR ELECTRONIC APPARATUS

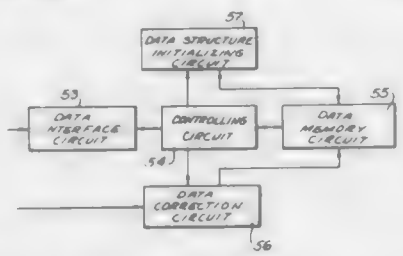
Toshio Nishimura, Jyoyo, Japan, assignor to Sharp Kabushiki Kaisha, Osaka, Japan

Continuation of Ser. No. 131,342, Dec. 9, 1987, abandoned, which is a continuation of Ser. No. 689,847, Jan. 9, 1985, abandoned. This application Jan. 10, 1989, Ser. No. 296,332
Claims priority, application Japan, Jan. 11, 1984, 59-4172; Jan. 20, 1984, 59-8967
Int. Cl.[5] G06F *1/24*
U.S. Cl. 364—900 2 Claims

1. A reset circuit for an electronic apparatus capable of outputting a reset signal when power is switched on for said apparatus, said reset circuit comprising

memory means for storing programs for said apparatus, said memory means storing an all-clear code at a specified address therein,

an address counter for addressing said memory means, said address counter causing said all-clear code to be outputted from said memory means if said address counter is in a reset condition, and



control means which serves to check whether or not said memory means is outputting said all-clear code and to release said address counter from said reset condition if said memory means is thereby found to be outputting said all-clear code such that said address counter can cause said memory means to output operation programs for said electronic apparatus.

5,007,015

PORTABLE COMPACT DEVICE

Yukio Yokozawa, Nagano, Japan, assignor to Seiko Epson Kabushiki Kaisha, Tokyo, Japan

Continuation of Ser. No. 792,712, Oct. 30, 1985, abandoned. This application Oct. 17, 1988, Ser. No. 259,469
Claims priority, application Japan, Nov. 6, 1984, 59-233881; Aug. 28, 1985, 60-188786
Int. Cl.[5] G06F *3/00*
U.S. Cl. 364—900 15 Claims

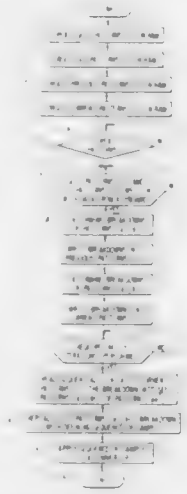
1. A portable compact device for use with an external device supplying input data having a data structure consisting of said input data and associated indicating data which indicates the data type and stored address for the input data comprising:

interface means for providing an interface between an external device and the portable compact device;

data memory means for storing the input data received by said interface means at an address corresponding to the indicating data;

processing means coupled to the data memory means for receiving and sending the data between said interface means and said data memory means, the processing means including;

control means for processing data stored in the data memory means in accordance with the indicating data and determining whether the data structure in the data memory means allows for the processing of the input data by the control means; and



initializing means for establishing an initialized data structure in the data memory means when the control means determines that the data structure does not allow for the processing of the input data, the initialized data structure corresponding to an indicating data which indicates the data type and stored address which allows for the processing of the data stored in the data memory means.

FRACTAL-TYPE PERIODIC TEMPORAL SIGNAL GENERATOR

Alain Le Méhauté, Gif sur Yvette; Claude Roques-Carmes, Besancon; Dalloul Webbi, Besancon, and Jean-Francois Quiniou, Besancon, all of France, assignors to Compagnie Generale D'Electricite, Paris, France

Filed Dec. 21, 1988, Ser. No. 287,429
Claims priority, application France, Dec. 21, 1987, 87 17809
Int. Cl.[5] G06F *1/02, 1/04, 7/58, 9/302*
U.S. Cl. 364—900 4 Claims

1. A periodic temporal signal generator for generating a periodic binary signal representing a binary sequence, said binary sequence having a periodic configuration pattern a_n which comprises an arrangement of seed patterns and which is one of m pattern components of a term U_n of a sequence of terms $U_0U_1 \ldots U_n$, where m and n are integers and m is greater than 1, and where U_0 comprises an initial term of said sequence of terms and is formed by one of each of said seed patterns, said pattern components of said term U_n being defined by application of m pattern composition laws to the pattern components of the preceding term U_{n-1} of said sequence of terms, said generator comprising working memory means (**13**) for storing a definitive patterns file which contains a final arrangement of the seed patterns constituting said periodic configuration pattern a_n, and output means (**14**) coupled to said working memory means for supplying said periodic binary signal in accordance with the content of said definitive patterns file, said signal generator further comprising:

an old patterns file (**13***b*) in said working memory means for storing breakdowns into said seed patterns of old pattern components resulting from at least one application to said seed patterns of said pattern composition laws;

a previous patterns file (**13***c*) in said working memory means for storing breakdowns into said seed patterns of previous pattern components obtained during an iteration step immediately preceding the current iteration step, each of said previous pattern components corresponding to a respective one of said seed patterns in said old pattern components;

reading means coupled to said working memory means for reading said old pattern components from said old patterns file and said previous pattern components form said previous patterns file;

replacing means coupled to said reading means for replacing the seed patterns of said old pattern components with the seed pattern breakdown stored in said previous patterns file for the corresponding previous pattern component to thereby obtain seed pattern breakdowns of current pattern components and

a current patterns file (**13***d*) in said working memory coupled to said replacing means for storing said seed pattern breakdowns of said current components; and

repeating means for repeatedly actuating both said reading means and said replacing means a given number of times until said definitive patterns are obtained.

5,007,017

METHOD AND APPARATUS FOR DATA COMMUNICATION THROUGH COMPOSITE NETWORK

Hideaki Kobayashi, Kanagawa, Japan, assignor to Hitachi, Ltd., Tokyo, Japan

Filed Apr. 6, 1987, Ser. No. 35,030
Claims priority, application Japan, Apr. 4, 1986, 61-77841
Int. Cl.[5] G06F *13/00*
U.S. Cl. 364—900 10 Claims

1. A method of data communication through a composite network system in which a plurality of networks are connected to one another, wherein a center having an information collecting function connected to a first network performs data communication with a plurality of work stations connected to a second network, comprising the steps of:

formating at said center a composite command in the form of a data unit in which plural pairs of information including addresses of the work stations from which information is collected and commands to said work stations associated with said addresses are contained collectively;

transmitting said formated composite command to said second network through said first network; and

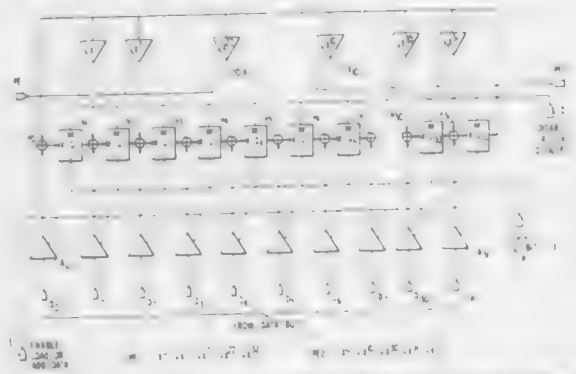
furnishing the composite command successively to work stations in said second network, and extracting respective commands to the work stations by individual work stations from the composite command on the basis of the addresses associated with the commands as contained in said composite command.

5,007,018

VITAL PROCESSOR IMPLEMENTED WITH NON-VITAL HARDWARE

David B. Rutherford, Jr., Rochester, N.Y., assignor to General Signal Corp., Stamford, Conn.

Division of Ser. No. 550,693, Nov. 10, 1983, Pat. No. 4,831,521. This application Apr. 7, 1989, Ser. No. 335,179
Int. Cl.[5] G06F *5/00*
U.S. Cl. 364—900 8 Claims



1. A method, useful in fail safe applications, of using a feedback shift register, with plural stages, arranged to provide maximal length sequences, to compute a multi-bit term from a group of at least two input multi-bit terms, the group selected from a family of groups, wherein each of said input multi-bit terms identifies a true or false state of a binary input and is unique to a particular input, said method comprising:

(a) selecting a different predetermined bit pattern dependent on which one of the groups of said family of groups of input multi-bit terms is used in the computation,

(b) preconditioning said feedback shift register by controlling each stage thereof to attain a condition identical to a corresponding bit of said selected predetermined bit pattern,

(c) exclusive OR'ing one of said input multi-bit terms, bit by bit, with a corresponding stage of said feedback shift register and applying a result to said feedback shift register, and

(d) repeating said step (c) for each other of said input multi-

bit terms to produce a resulting bit pattern in said feedback shift register,

whereby the resulting bit pattern is the computed multi-bit term.

ELECTRONIC THESAURUS WITH ACCESS HISTORY LIST

Peter L. Squillante, Central Islip; Julius Egyud, Dix Hills, and Abraham Karron, Long Beach, all of N.Y., assignors to Franklin Electronic Publishers, Incorporated, Mt. Holly, N.J.

Filed Jan. 5, 1989, Ser. No. 294,058

Int. Cl.[5] G06F *15/40*

U.S. Cl. 364—900 4 Claims

3. A machine thesaurus comprising:

a display screen,

a keyboard for entering characters to be displayed on said screen,

an entry key on said keyboard to enable the user to enter a word that appears on said screen, said word being an original entry word,

first processing means responsive to said entry of said original entry word to provide on said screen a set of synonyms for said original entry word and to divide said set of synonyms into subsets, each of said subsets having the same meaning core,

second processing means to provide on said screen the meaning core definition for each of said subsets,

first edit means responsive to user selection of any word displayed on said screen by any one of said processing means to provide the user selected word as an additional entry word,

said first and second processing means being responsive to each of said additional entry words to provide a corresponding set of synonyms, synonym subsets and meaning core definitions,

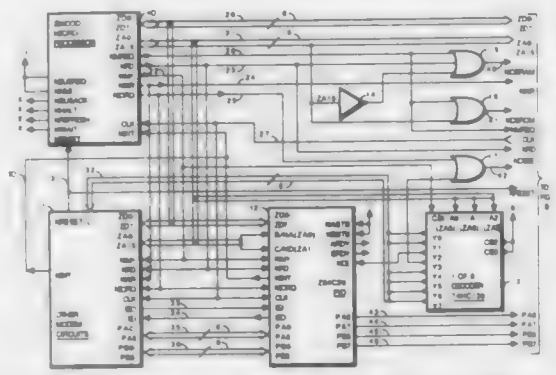
memory means for retaining each of said entry words in sequence as a history list,

means for re-accessing words on said history list, and

deletion means responsive to said history list in said memory means becoming full to delete the earliest additional entry words in sequence from said history list to provide room for the latest additional entry words; said original entry word being retained in said history list.

5,007,020

METHOD FOR MEMORY ADDRESSING AND CONTROL WITH REVERSAL OF HIGHER AND LOWER ADDRESS



Jeffrey Inskeep, Marietta, Ga., assignor to Hayes Microcomputer Products, Inc., Norcross, Ga.

Division of Ser. No. 27,635, Mar. 18, 1987, Pat. No. 4,924,441.

This application May 7, 1990, Ser. No. 519,839

Int. Cl.[5] G06F *12/02, 13/16*

U.S. Cl. 364—900 8 Claims

1. In a processor controlled system having a processor and at least one memory, said processor providing an N bit address line, said N bit address line being dividable into an A bit higher order address, and a N-A bit lower order address, K bits of said lower order address being used to selectively enable said memory, and up to N-K bits of said N bit address line being used to specify a desired data address in said memory, said memory having L address line inputs for specifying 2^L data addresses in said memory, said L address lines being dividable into a C bit higher order address and an L-C bit lower order address, a first data of said string of data to be stored at a first memory address, and remaining data of said string of data to be stored at consecutive memory addresses, an improved method for addressing said memory for storing said string of data, comprising:

(a) setting the value of A to equal L-C;

(b) setting the value of K to equal N-L;

(c) providing said A bit higher order address from said processor to said memory as said L-C bit lower order address;

(d) providing up to N-A-K bits of said N-A bit lower order address from said processor to said memory as said C bit higher order address, where N-A-K equals C;

(e) setting said A bit higher order address and said N-A-K bits of said N-A bit lower order address to point to said first memory address;

(f) enabling said memory using up to said K bits of said N-A bit lower order address;

(g) transferring said first data to said memory;

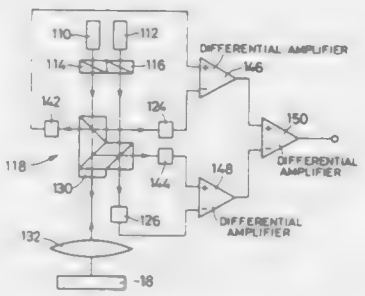
(h) altering said A bit higher order address;

(i) transferring a next data of said string of data to said memory; and

(j) repeating steps (h) and (i) until said string of data has been transferred to said memory.

5,007,021

MAGNETO-OPTICAL DATA READING APPARATUS



Yutaka Hattori, Nagoya, Japan, assignor to Brother Kogyo Kabushiki Kaisha, Nagoya, Japan

Continuation-in-part of Ser. No. 637,796, Aug. 6, 1984, abandoned. This application Jan. 9, 1986, Ser. No. 816,999

Claims priority, application Japan, Aug. 6, 1983, 58-144027; Aug. 6, 1983, 58-144028; Aug. 6, 1983, 58-144029; Aug. 6, 1983, 58-144030; Aug. 6, 1983, 58-144031

Int. Cl.[5] G11C *13/06*

U.S. Cl. 365—122 5 Claims

1. An apparatus for reading out information from individual memory locations on a magneto-optical storage medium at which the information is written through magnetization of the storage medium in one of opposite directions normal to a surface of the storage medium, comprising:

a light source device for producing two beams of circularly polarized light having different wavelengths and different rotating directions, said two beams of circularly polarized light being concurrently incident upon the same memory location of said storage medium, and reflected from said storage medium;

a dichroic mirror for separating said two beams reflected from said storage medium, by a difference in wavelength between the two beams; and

a pair of data-reading optical detectors for detecting quantities of said two beams reflected from said storage medium, respectively, and generating output signals corresponding to the detected quantities to read said information from said storage medium.

5,007,022

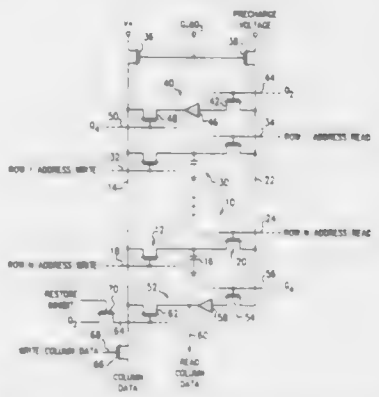
TWO-PORT TWO-TRANSISTOR DRAM

Anthony W. Leigh, Houston, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex.

Continuation of Ser. No. 135,957, Dec. 21, 1987, abandoned. This application Nov. 9, 1989, Ser. No. 434,617

Int. Cl.[5] G11C *11/40, 13/00*

U.S. Cl. 365—189.04 35 Claims



8. A column of random access memory devices said column comprising:

A. first and second bit lines capable of carrying data levels along said column;

B. plural memory cells arranged in series along said column, each cell including a storage capacitor connected between a storage node and a reference voltage to store one datum level on said storage node at a time, a first field effect transistor connected between said first bit line and said storage node, and a second field effect transistor connected between said second bit line and said storage node, said first and second transistors being capable of conducting data levels between said first and second bit lines and said storage node;

C. a refresh circuit connected to said first and second bit lines and containing circuit elements capable of refreshing a datum level in a cell; and

D. a read and restore circuit connected to said first and second bit lines and containing circuit elements capable of reading a datum level from a certain cell to form a datum

signal on a datum line and restoring said read datum level back in said certain cell.

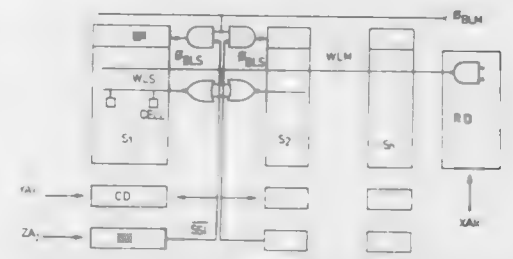
BITLINE PRECHARGE CIRCUIT OF MULTI-SECTIONAL MEMORY ARRAY



Byeongyun Kim, Seoul, and Sangki Hwang, Kyongsangbuk, both of Rep. of Korea, assignors to Samsung Electronics Co., Ltd., Suwon, Rep. of Korea

Filed May 5, 1989, Ser. No. 348,213

Claims priority, application Rep. of Korea, Jul. 21, 1988, 88-9163

Int. Cl.[5] G11C *7/00, 8/00*

U.S. Cl. 365—203 4 Claims

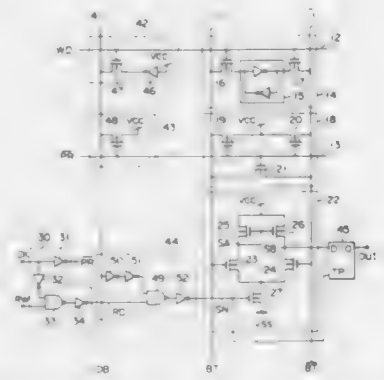
1. A bit line precharge circuit of a multi-sectional memory array, comprising:

first and second invertor circuits adapted to receive and invert a section decoding signal applied thereto;

a first NAND circuit adapted to receive and to NAND-gate the inverted section decoding signal from said first invertor circuit and a main bit line precharge pulse applied thereto;

a second NAND circuit adapted to receive and to NAND gate the inverted section decoding signal from said second invertor circuit and a main data line precharge pulse applied thereto;

third and fourth invertor circuits adapted to receive and to invert outputs from said first and second NAND circuits, respectively;



the bit line precharge circuit being adapted to receive an output of said third invertor circuit and a data line precharge circuit adapted to receive an output from said fourth invertor circuit so that the operation margin of said section decoding signal increases by as much as the width of said main bitline precharge pulse.

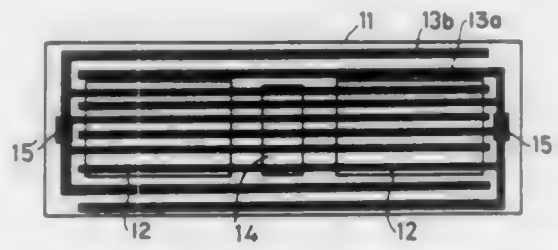
5,007,024

SEMICONDUCTOR MEMORY DEVICE WITH SENSE AMPLIFIER CONTROLLER

Yutaka Tanaka, Yokohama, and Masanori Haraguchi, Ayase, both of Japan, assignors to Kabushiki Kaisha Toshiba, Kanagawa, Japan

Filed Jan. 18, 1990, Ser. No. 466,920
Claims priority, application Japan, Jan. 31, 1989, 1-21004
Int. Cl.[5] G11C *7/00, 11/407*
U.S. Cl. 365—207 7 Claims

1. A semiconductor memory device comprising:
a memory cell;
a pair of bit lines connected to said memory cell;
first precharging means, for precharging said pair of bit lines;
a sense amplifier for amplifying a potential difference between said pair of bit lines;
a dummy bit line having a load capacity equal to that of each of said pair of bit lines;
a dummy memory cell having a bit line drive capability equal to that of said memory cell;
second precharging means, for precharging said dummy bit line;
selecting means for simultaneously selecting said memory cell and said dummy memory cell;
dummy bit line potential sensing means for sensing that the potential of said dummy bit line is changed from a precharge potential by a predetermined potential when said dummy memory cell is selected by said selecting means; and
sense amplifier control means for receiving an enable signal which enables an operation of said sense amplifier, and a sensed signal from said dummy bit line potential sensing means to determine an operation period of said sense amplifier, in response to both the enable and the sensed signals.



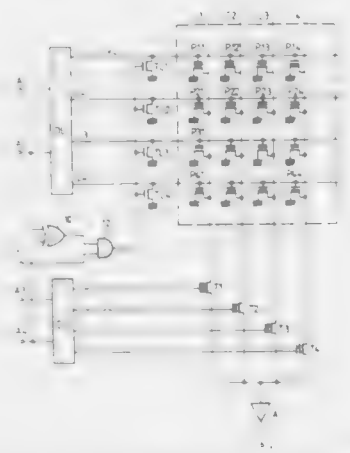
5,007,025

POWER AND SIGNAL LINE BUSSING METHOD FOR MEMORY DEVICES

Sang K. Hwang, Sang Ju; Tae S. Jung, Buchon, and Kyu H. Choi, Seoul, all of Rep. of Korea, assignors to Samsung Electronics Co., Ltd., Suwon, Rep. of Korea

Filed Mar. 31, 1989, Ser. No. 330,917
Claims priority, application Rep. of Korea, Jul. 21, 1988, 88-9162
Int. Cl.[5] G11C *13/00*
U.S. Cl. 365—226 3 Claims

1. A memory device formed on a semiconductor substrate having circuitry positioned adjacent a single memory cell array, said memory device comprising:
a plurality of power lines formed above said single memory cell array for supplying power to said circuitry, each power line being substantially parallel to and spaced apart from every other power line; and
a plurality of ground lines formed above said single memory cell array for supplying ground potential to said circuitry,



each ground line being substantially parallel to and spaced apart from every other ground line.

METHOD FOR THE TESTING OF ONE TIME PROGRAMMABLE MEMORIES AND CORRESPONDING MEMORY

Jean-Marie Gaultier, Rousset sur Arc; Augustin Farrugia, La Ciotat, and Bertrand Conan, Aix-en-Provence, all of France, assignors to SGS-Thomson Microelectronics S.A., Gentilly, France

Filed Mar. 21, 1989, Ser. No. 326,618
Claims priority, application France, Mar. 25, 1988, 88 03918
Int. Cl.[5] G11C *13/00*
U.S. Cl. 365—201 11 Claims

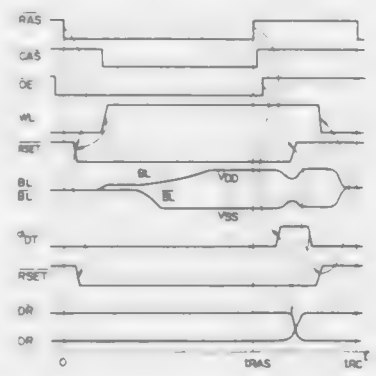
1. A one time programmable memory, comprising a memory having an array of memory cells, a decoder having inputs for receiving an address and outputs for addressing said cells, and a reading circuit for providing a signal corresponding to information which may be stored in the cells addressed by the decoder, said memory comprising a test mode terminal for receiving a test signal, and an inhibition circuit connected to said test mode terminal and to the reading circuit, said inhibition circuit comprising means enabled by said test signal for inhibiting the reading of the cells addressed by the decoder whenever the address received by the decoder has just predetermined values and for enabling the reading of the cells whenever the address has second predetermined values, whereby the signal provided by the reading circuit depends upon the address of cell received by the decoder and all cells are virgin cells.

5,007,027

DATA PROTECTION SYSTEM IN A DATA PROCESSING SYSTEM

Hiroyuki Shimoi, Yokohama, Japan, assignor to Fujitsu Limited, Kawasaki, Japan

Filed May 9, 1989, Ser. No. 349,310
Claims priority, application Japan, May 16, 1988, 63-118963
Int. Cl.[5] G11C *5/14*
U.S. Cl. 365—229 10 Claims



1. A data protection system for protecting data stored in a memory having a memory unit for storing the data, a power unit for supplying power to the memory unit, and a battery charged by the power source and supplying a battery voltage to the memory unit when the power source is accidentally interrupted, said data protection system comprising:
first voltage check means, connected to the battery, for comparing the battery voltage with a first reference voltage and generating a battery error signal when the battery voltage is lower than the first reference voltage; and
second voltage check means, connected to the battery for comparing the battery voltage with a second reference voltage which is higher than the first reference voltage and generating a battery charging signal when the battery voltage lies between the first reference voltage and the second reference voltage.

5,007,028

MULTIPORT MEMORY WITH IMPROVED TIMING OF WORD LINE SELECTION

Shigeo Ohshima, Tokyo; Haruki Toda, Yokohama, and Tatsuo Ikawa, Mitaka, all of Japan, assignors to Kabushiki Kaisha Toshiba, Kawasaki, Japan

Continuation of Ser. No. 293,845, Jan. 5, 1989, abandoned. This application Jul. 16, 1990, Ser. No. 552,851
Claims priority, application Japan, Jan. 19, 1988, 63-8929
Int. Cl.[5] G11C *8/00*
U.S. Cl. 365—233 18 Claims

1. A multiport memory comprising:
a storage section including bit lines and a word line, respectively defining rows and columns, a data transfer gate, and a dynamic memory cell;
a serial port having a serial access function in a column direction of said storage section;
a word line signal for selecting a word line of said storage section; and
means for disabling said word line signal in response to a row address strobe signal and a data transfer gate signal at times when the row address strobe signal is raised in a transfer cycle in which data held by said memory cell is transferred to said serial port before the data transfer to said serial port is completed by said data transfer gate in response to the data transfer gate signal, wherein the word line signal is not disabled until the data transfer to said serial port is completed by said data transfer gate.

5,007,029

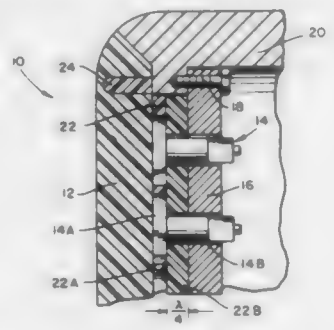
UNDERSEA RELOCATION APPARATUS & METHOD

Sherman A. Scott, 120 Greenbriar Cir., Lafayette, La. 70503

Continuation of Ser. No. 836,640, Mar. 5, 1986, abandoned. This application Oct. 26, 1987, Ser. No. 220,921
Int. Cl.[5] H04B *1/59*
U.S. Cl. 367—4 6 Claims

1. An apparatus for relocating an underwater object comprising in combination:
(a) a buoyant spool having flanges on either end, said spool defining a lengthwise hole along the central axis thereof;
(b) an acoustic transponder disposed within said hole, said transponder including an end cap assembly having a releasable catch, said releasable catch opening in response to an acoustic signal received by said transponder;
(c) A spool line attached to said spool by a first end and wound about said spool between said flanges;
(d) attachment means for attaching the second end of said spool line and said releasable catch to said object.

5,007,030



TRANSDUCER ASSEMBLY FOR DEEP SUBMERGENCE

Shelby F. Sullivan, Arcadia; Harper J. Whitehouse, Hacienda Heights, and Richard P. Hamilton, Altadena, all of Calif., assignors to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Feb. 5, 1970, Ser. No. 14,824
Int. Cl.[5] H04R *1/02*
U.S. Cl. 367—153 9 Claims

1. A transducer assembly, useful at depths up to 4500 ft, comprising:
a diaphragm;
at least one transducer element, comprising a flat head and a cylindrical active part, bonded by its head to the diaphragm;
pressure-resistant means for supporting the transducer assembly;
an acoustic isolator disposed between the head and active part of the at least one transducer element and between the diaphragm and the pressure-resistant means the acoustic isolator not touching the active part of the at least one transducer element;

the material of the acoustic isolator being elastically linear and equal in thickness to one-quarter wavelength of the

corresponding operating frequency of the transducer element.

5,007,031

APPARATUS FOR POSITIONING GEOPHONES IN SHALLOW HOLES

Otis G. Erich, Jr., Norwalk, Calif., assignor to Union Oil Company of California, Los Angeles, Calif.

Filed Dec. 30, 1988, Ser. No. 292,388
Int. Cl.[5] H04R *1/00*
U.S. Cl. 367—178 **16 Claims**

1. An apparatus for positioning geophones in shallow holes in the earth comprising a geophone and a geophone planting tool engageable with said geophone to implant said geophone in the earth at the bottom of a shallow hole and to level and align said geophone in said shallow hole, said geophone having an electrical conductor connected thereto, said geophone planting tool being adapted to be engaged with said geophone and held in engagement therewith during implanting, leveling and aligning thereof by pressure on said conductor and to be disengaged from said geophone after aligning, leveling and implanting said geophone by release of pressure on said conductor.

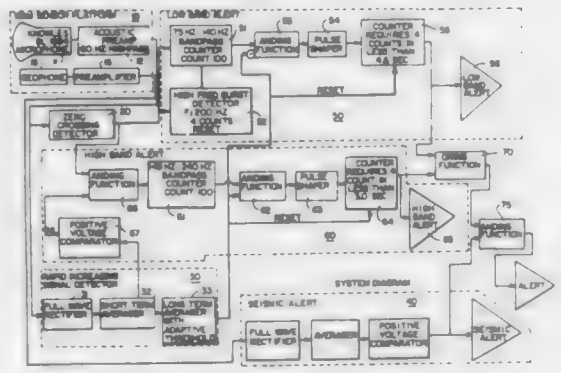
ACOUSTIC ALERT SENSOR

Randy M. Jensen, Inver Grove Heights, Minn., assignor to Honeywell Inc., Minneapolis, Minn.



Filed Jun. 8, 1990, Ser. No. 535,267
Int. Cl.[5] H04B *1/06*
U.S. Cl. 367—136 **11 Claims**

1. An acoustic alert detector for detecting an acoustic signal produced by a vehicle, said detector comprising:

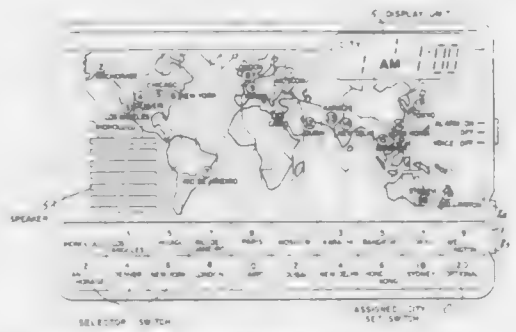
sensing means for sensing acoustic signals providing a first signal having a zero reference;

first counting means for counting a first predetermined number of crossings by said first signal of said zero reference, and for providing a second signal upon said first predetermined number of said crossings by said first signal of said zero reference being counted;

second counting means for counting a second predetermined number of said second signals, and for providing a third signal upon said second predetermined number of said second signals being counted;

first timing means for permitting said second signal to pass to said second counting means after a first predetermined time;

second timing means for resetting said first counting means after a second predetermined time, said second predetermined time being greater than said first predetermined time; and



third timing means for resetting said second counting means after a third predetermined time.

5,007,033

WORLD TIMEPIECE

Maki Kubota, and Hideo Aso, both of Tokyo, Japan, assignors to Seikosha Co., Ltd., Japan

Filed Dec. 15, 1988, Ser. No. 285,002
Claims priority, application Japan, Dec. 21, 1987, 62-323585
Int. Cl.[5] G04B *19/22*
U.S. Cl. 368—21 **4 Claims**

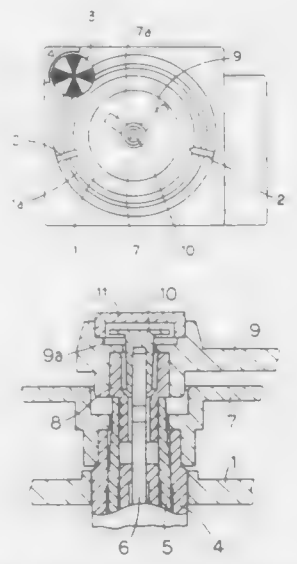
1. A world timepiece, comprising:

actuatable selector switches corresponding respectively to main cities of desired zones out of a plurality of time-lag zones into which the world is divided, the number of said desired zones being less than the number of said time-lag zones;

an assigned city storage circuit for storing data representative of a city of an arbitrary zone selected from said time-lag zones including zones other than said desired zones as an option;

an assigned city setting circuit for setting said data into said assigned city storage circuit;

an optional switch actuatable to read out the content of said assigned city storage circuit· and



a display unit for selectively displaying the time of one of said each main city or said assigned city according to the actuation of one of said selector switches or said optional switch.

5,007,034

OPERATION INDICATOR OF TIMEPIECE AND SO ON

Shigeru Shimozono, Tokyo, Japan, assignor to Seikosha Co., Ltd., Japan

Filed Oct. 13, 1989, Ser. No. 421,178
Claims priority, application Japan, Oct. 13, 1988, 63-13[illegible]29[U]
Int. Cl.[5] G04B *19/20, 19/04*
U.S. Cl. 368—77 **18 Claims**

1. An operation indicator comprising: an hour hand shaft, a minute hand shaft, and a second hand shaft coaxially fitted and extending through a dial; an hour hand and a minute hand having a central concave portion and being secured at the end of said hour and minute hand shafts respectively; an operation indicating disk secured at the end of said second hand shaft and disposed at the central concave portion of said minute hand; and a transparent cover installed at said central concave portion.

5,007,035

DISTANCE PULSE AVERAGING UNIT

Paul A. Markow, Huntsville; Kevin R. Hammond, Madison, and Donald E. Hutchings, Decatur, all of Ala., assignors to Chrysler Corporation, Highland Park, Mich.

Filed Jun. 29, 1990, Ser. No. 546,608
Int. Cl.[5] G04F *8/00;* **G01R** *23/02*
U.S. Cl. 368—118 **4 Claims**

1. Apparatus for measuring periods between edges of asymmetrical pulses emanating from a measurand sensor with respect to a reference clock signal, said sensor pulses varying in frequency in proportion to rates of change of the measurand; said system comprising:

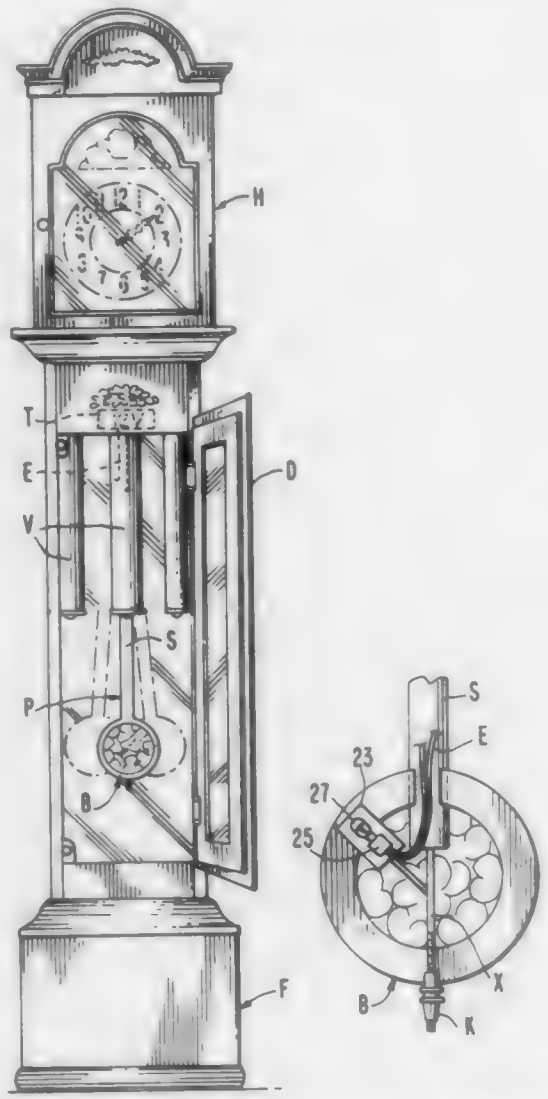
(a) clock means, having an internal reference clock oscillator, and generating therefrom: (1) a first period-counting, control- clock (1stCCLK) signal of a chosen frequency apportioned to a fixed frequency of the oscillator, (2) a second period-counting, control-clock (2ndCCLK) signal of another chosen frequency apportioned to the frequency of said 1stCCLK signal and (3) a filtered-clock (FLT-CLK) signal of the same frequency as that of said first period-counting, control-clock signal for providing clock signals used to establish valid edges of the sensor pulses;

(b) valid edge detection means having an input terminal for receiving each raw pulse signal from the sensor and another terminal for receiving said FLT-CLK signals and producing therefrom an initial valid edge (VE) pulse signal indicative of a valid edge of that raw pulse signal after buffering the raw pulse signal and after that buffered signal remains for a chosen number of pulses, in series, of said FLT-CLK signal;

(c) counting means responsive to each VE signal during the receipt of each raw pulse signal and having a terminal for

receiving said 1stCCLK and 2ndCCLL signals, said oscillator signal and a signal that indicates whether the frequency of said raw pulse is greater than a chosen frequency of pulses from said sensor and producing therefrom in a storage register a count of said 1stCCLK signal pulses if the frequency of said raw pulse is less than the chosen sensor pulse frequency or a count of said 2ndCCLK signal if the frequency of said raw pulse is greater than the chosen sensor pulse frequency, said counting terminating upon the receipt of a next VE signal.

5,007,036



CASE CLOCK WITH ILLUMINATED PENDULUM

James H. Kelly, Jr., Hiawasee, Va., assignor to Pulaski Furniture Corporation, Pulaski, Va.

Filed Mar. 30, 1990, Ser. No. 501,552
Int. Cl.[5] G04B *15/00;* **G04F** *5/00*
U.S. Cl. 368—134 **17 Claims**

1. In a clock having a casing and a pendulum housed within a section of said casing adapted for oscillating movement along an arc, said casing section having at least one opening therein through which said pendulum is visible from the exterior, said pendulum including an arm anchored within said casing at its upper end for said oscillating movement, and carrying adjacent its lower end a head, in combination, the improvement of illuminating means for said pendulum head comprising a light

source energized by an electrical current and mounted on said pendulum head, and means for supplying electrical current to

said light source to energize the source while said pendulum is oscillating.

5,007,037

OPTICAL DISK DRIVE SYSTEM UTILIZING ELECTRON TRAPPING MEDIA FOR DATA STORAGE

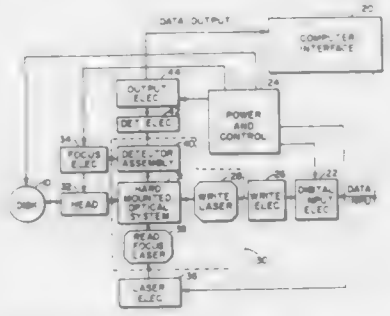
Joseph Lindmayer, Potomac, Md., assignor to Quantex Corporation, Rockville, Md.

Continuation-in-part of Ser. No. 870,877, Jun. 5, 1986, Pat. No. 4,864,536, which is a continuation-in-part of Ser. No. 786,095, Oct. 10, 1985, Pat. No. 4,705,952. This application Jul. 29, 1988, Ser. No. 225,846

The portion of the term of this patent subsequent to Sep. 5, 2006, has been disclaimed.

Int. Cl.[5] **G11B** *7/00*

U.S. Cl. 369—100 **12 Claims**



1. An optical disk drive system, comprising:

at least one optical disk fixedly mounted in a sealed housing, said optical disk comprising electron trapping media for storing and releasing digital information in the form of light energy;

means for rotatably supporting said optical disk;

means for rotating said optical disk;

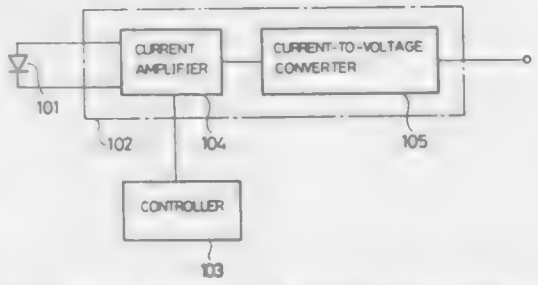
transducer means comprising at least two light beam generating means and a focusing objective lens for writing digital information on and reading information from said optical disk as light energy on at least one planar surface thereof, wherein said light beam generating means used for writing digital information on said disk generates a light beam having a first predetermined wavelength which raises electronics in said electron trapping media to an elevated energy level at which they are trapped, and

said light beam generating means used for reading digital information from said disk generates a light beam having a second and different predetermined wavelength which releases a portion of said trapped electrons, resulting in the emission of light of a third predetermined wavelength;

positioning means for moving said focusing objective lens between the tracks on said optical disk, said positioning means includes means for detecting said tracks and means for moving said focusing objective lens from one track to the next adjacent track on said optical disk.

5,007,038

METHOD AND APPARATUS FOR PRODUCING AN ACCURATE ERROR SIGNAL IN AN OPTICAL RECORDING MEDIUM DRIVER



Kazuhiko Nakane; Teruo Furukawa; Masayoshi Shimamoto, and Kyosuke Yoshimoto, all of Amagasaki, Japan, assignors to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Filed Aug. 1, 1988, Ser. No. 226,722

Claims priority, application Japan, Aug. 4, 1987, 62-195691

Int. Cl.[5] **G11B** *7/00*

U.S. Cl. 369—44.11 **20 Claims**

1. A method of providing an accurate error signal in an optical recording medium driver having different operation modes including recording, reproducing, and erasing data and further using recording media having different reflectivities, comprising the steps of:

illuminating a recording surface of the recording media with a focused light beam for recording, reproducing, and erasing data.

detecting light reflected from the recording surface and forming an error signal from the detected light;

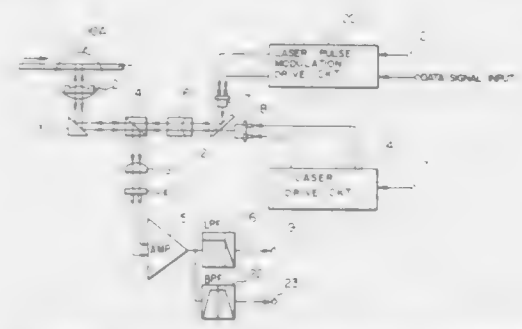
converting the error signal from a current to a voltage;

estimating a power of the reflected light from a product of the reflectivity of the recording media and a power of the light beam; and

selecting a gain of the converting step from one of a plurality of values using the estimated power.

5,007,039

OPTICAL INFORMATION RECORDING/REPRODUCING APPARATUS



Akito Sakemoto; Hitoshi Watanabe, both of Ibaraki, and Yasunori Kanazawa, Hachioji, all of Japan, assignors to Hitachi Maxell, Ltd., Osaka, Japan

Filed Sep. 22, 1988, Ser. No. 247,854

Claims priority, application Japan, Sep. 22, 1987, 62-236294

Int. Cl.[5] **G11B** *7/125*

U.S. Cl. 369—116 **8 Claims**

1. An optical information recording/reproducing apparatus, comprising:

signal recording means for recording a signal on a recording film of a recording medium by raising temperature of said recording film through irradiation with a writing laser beam having a predetermined wave length;

signal reproducing means for reproducing said signal by irradiating with a reading laser beam the recording film of said recording medium in which said signal is recorded;

an optical system provided in common to both said writing laser beam and said reading laser beam;

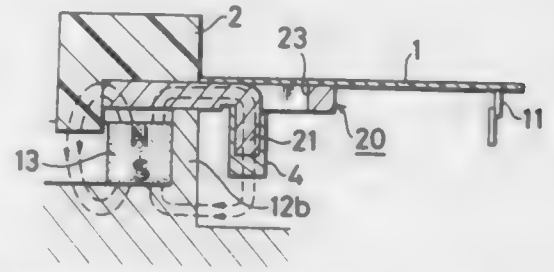
the signal recorded on said recording film being reproduced substantially simultaneously with the recording of said signal through said signal reproducing means for allowing confirmation of said signal having been recorded; and

means for modulating intensity of said writing laser beam determined by said signal to be recorded with a frequency at least twice as high as the maximum frequency of said signal to be recorded.

5,007,040

MAGNETIC RECORDING AND/OR REPRODUCING APPARATUS HAVING A RETAINING MECHANISM FOR A DISC-SHAPED MAGNETIC RECORD BEARING MEDIUM

Shigeki Okauchi, Tokyo, Japan, assignor to Canon Kabushiki Kaisha



Continuation of Ser. No. 169,073, Mar. 16, 1988, abandoned, which is a continuation of Ser. No. 778,380, Sep. 20, 1985, abandoned. This application Apr. 4, 1989, Ser. No. 336,648

Claims priority, application Japan, Sep. 22, 1984, 59-143956[U]; Jan. 30, 1985, 60-14468

Int. Cl.[5] **G11B** *5/48, 5/62*

U.S. Cl. 369—270 **6 Claims**

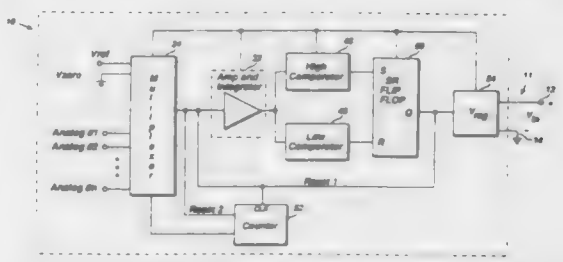
1. A disc-shaped magnetic record bearing medium for a magnetic recording and/or reproducing apparatus, said apparatus comprising a magnetic head and a spindle having a magnet thereon, said medium having a central portion ring-shaped magnetizable member attached to the central portion, said medium being so arranged that said magnetizable member is attracted by the magnet on said spindle in the state where said medium is mounted on said spindle, said magnetizable member having a plurality of projections formed by bending portions near the outer periphery of said magnetizable member over the entire periphery, and said projections being located between said head and said magnet, spaced by a predetermined distance from the outer periphery of said magnet, said projections being

located at an outside of a part where said magnetizable member and said spindle having the magnet thereon are attached to each other, thereby shunting a sideward leakage of a magnetic flux from said magnet.

5,007,041

Patent Not Issued For This Number

5,007,042



METHOD AND APPARATUS FOR TRANSMITTING ANALOG DATA EMBEDDED IN A DIGITAL PULSE TRAIN

Larry D. Santi, 5045 NE. 23rd St., Renton, Wash. 98056

Filed Sep. 8, 1989, Ser. No. 404,670

Int. Cl.[5] **H03C** *1/04;* **H03K** *3/64*

U.S. Cl. 370—9 **22 Claims**

8. A circuit for transmitting a signal on a two-wire transmission line from one of a plurality of transmitters coupled to said transmission line, comprising:

an integrator;

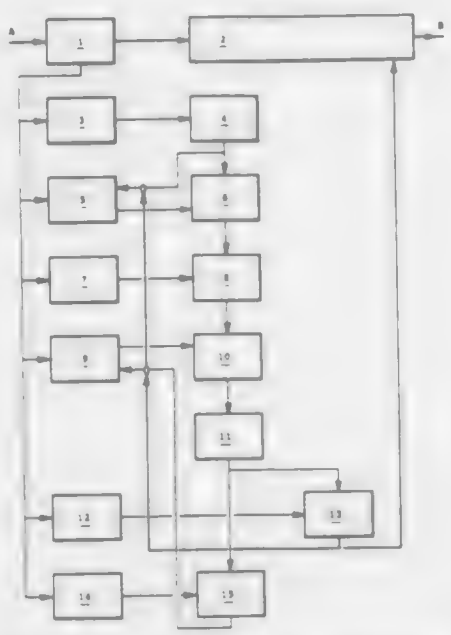
a multiplexer having an output coupled to said integrator;

an analog signal source coupled to the input of said multiplexer; and

a switching means for placing a signal on said two-wire transmission line, said switching means being coupled to the output of said integrator, said switching means placing a sync pulse having a selected amplitude on said two-wire transmission line when the charge on said integrator exceeds a high threshold value or is less than a low threshold value and placing a data pulse having a first amplitude different from said selected amplitude on said two-wire transmission line when the charge on said integrator exceeds said low threshold value but is less than said high threshold value, said selected amplitude identifying said signal as being generated by a select set of transmitters coupled to said transmission line.

5,007,043

METHOD FOR TRANSMITTING, VIA A PLURALITY OF ASYNCHRONOUSLY TIME-DIVIDED TRANSMISSION CHANNELS, A FLOW OF DATA CELLS, THE STATE OF A COUNTER FOR EACH TRANSMISSION CHANNEL BEING KEPT UP TO DATE IN ACCORDANCE WITH THE NUMBER OF DATA CELLS PER UNIT OF TIME



Frans van den Dool, Leidschendam, and Jacob C. van der Wal, Delft, both of Netherlands, assignors to Koninklijke PTT Nederland N.V., Groningen, Netherlands

Filed Jan. 30, 1990, Ser. No. 472,349

Claims priority, application Netherlands, Feb. 3, 1989, 8900269

Int. Cl.[5] H04J *3/16*

U.S. Cl. 370—60 **14 Claims**

1. A method for transmitting, via a transmission medium with a plurality of virtual, asynchronously time-divided transmission channels, a flow of data supplied to that transmission medium, and consisting of data cells which are each transmitted via one of those transmission channels, and each of which comprises a group of control words with one or more control words as well as a group of information words with one or more information words, the group of control words comprising a control word with a channel indication indicating via which transmission channel the relevant data cell has to be transmitted, and the state of a counter being kept up to date for each transmission channel, which state has a certain fixed minimum value, is decreased from time to time and is increased proportional to the number of data cells with a channel indication designating said transmission channel, which state of the counter is compared with a threshold value when a data cell with a channel indication designating said transmission channel arrives at the beginning of the transmission medium at a certain moment of arrival, after which the data cell is either let through to the transmission medium located downstream if the state of the counter is less than said threshold value or else not let through to the transmission medium located downstream, if the state of the counter is more than or equal to said threshold value, characterized

in that the state of the counter is decreased on the arrival of said data cell by a value which is a function of the length of time between the moment of arrival of that data cell and the moment of arrival of a certain preceding data cell with the same channel indication.

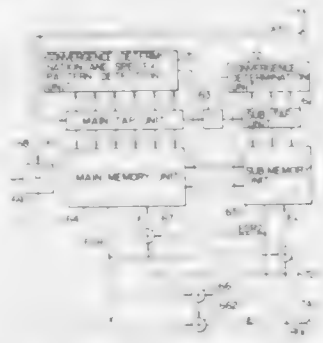
DIGITAL ADAPTIVE FILTER AND METHOD OF CONVERGENCE THEREIN



Seiji Miyoshi, Yokohama; Misao Fukuda, Tokyo; Seiichi Yamato, Fukuoka; Kouji Tokiwa, Atsugi, and Kazuyoshi Maruyama, Yokohama, all of Japan, assignors to Fujitsu Limited, Kawasaki, Japan

Filed Jul. 20, 1989, Ser. No. 382,413

Claims priority, application Japan, Jul. 20, 1988, 63-180565; Apr. 28, 1989, 01-111664

Int. Cl.[5] H04B *3/20*

U.S. Cl. 370—32.1 **28 Claims**

1. A digital adaptive filter for cancelling an echo component generated by a partial return of a transmission signal, comprising:

main tap group means for sequentially shifting the transmission signal and outputting the shifted signal in parallel;

at least one subtap group means, operatively connected to said main tap group means, for sequentially shifting the transmission signal and outputting the shifted signal in parallel;

main tap group memory means, operatively connected to said main tap group means, for storing a first echo replica which can be stored or read by using the parallel signal from said main tap group means as an address signal;

at least one subtap group memory means, operatively connected to said at least one subtap group means, for storing a second echo replica which can be stored or read by using the parallel signal from said at least one subtap group means as an address signal and which has a greater precision than the first echo replica stored in said main memory means;

adding means, operatively connected to said main tap group memory means and said at least one subtap group memory means, for adding the first echo replica read from said main tap group memory means and the second echo replica read from said at least one subtap group memory means.

5,007,045

INTEGRATED COMMUNICATIONS SYSTEM FOR HDLC VARIABLE-LENGTH DATA PACKETS AND FIXED-LENGTH VOICE/VIDEO PACKETS

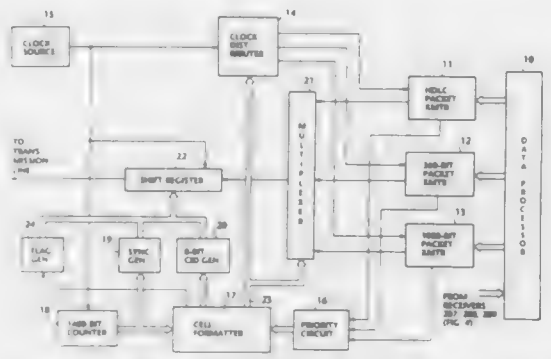
Kazuo Tsuzuki, Tokyo, Japan, assignor to NEC Corporation, Tokyo, Japan

Filed Feb. 5, 1990, Ser. No. 475,484

Claims priority, application Japan, Feb. 3, 1989, 1-24868

Int. Cl.[5] H04J *3/24*

U.S. Cl. 370—94.10 **11 Claims**



1. A method for transmitting HDLC (high level data link control) variable-length packets and non-HDLC fixed-length packets over a common transmission medium, wherein each of said variable-length and fixed-length packets is composed of one or more cells, comprising:

(a) decomposing each of said HDLC variable-length packets and each of said non-HDLC fixed-length packets into one or more cells;

(b) generating a cell identifier for each of said cells, said cell identifier identifying a type of the packet from which said cell is decomposed;

(c) transmitting a frame sync code from one end of said transmission medium;

(d) generating a frame comprising a plurality of fields each containing said cell identifier and each of said cells and transmitting the frame through said transmission medium;

(e) detecting said frame sync code at the other end of said transmission medium as a timing reference and deassembling said frame into the fields in response to said timing reference;

(f) deassembling each of the fields into a cell identifier and a cell; and

(g) composing the deassembled cells into the original HDLC variable-length packet or non-HDLC fixed-length packet according to the deassembled cell identifier.

5,007,046

COMPUTER CONTROLLED ADAPTIVE SPEAKERPHONE

Richard H. Erving, Red Bank; William A. Ford, Farmington, and Robert R. Miller, II, Convent Station, all of N.J., assignors to AT&T Bell Laboratories, Murray Hill, N.J.

Filed Dec. 28, 1988, Ser. No. 298,531

Int. Cl.[5] H04J *3/00*

U.S. Cl. 370—32.1 **26 Claims**

1. A voice switching apparatus for processing speech signals on a communication line, the apparatus including means for switching between a receive state for receiving speech signals from the communication line and a transmit state for transmitting signals over the communication line and comprising:

testing means for determining the operational readiness of speech processing circuitry in the apparatus, the type of communication line to which the voice switching apparatus is connected, and for determining the type of acoustic environment in which the voice switching apparatus is employed, the testing means determining the operational readiness of the speech processing circuitry by generating a tone signal and coupling this signal in a loop configuration through the speech processing circuitry, and by detecting the returned tone signal for obtaining the condition of said circuitry;

variable switched loss means for alternately inserting loss in a receive path for attenuating speech signals received from the communication line and in a transmit path for attenuating speech signals for transmission over the communication line; and

calibration means operably responsive to the testing means for adjusting the level of attenuation inserted by the variable switched loss means and for adjusting threshold switching levels at which the apparatus switches between the receive state and the transmit state.

5,007,047

ADAPTIVE RATE CONTROL FOR ECHO CANCELLING MODEM

Manickam R. Sridhar, Norton; John L. Payton, Dedham, and Carol A. Bargoot, Bradford, all of Mass., assignors to Codex Corporation, Mansfield, Mass.

Filed Dec. 2, 1988, Ser. No. 279,370

Int. Cl.[5] H04J *3/00*

U.S. Cl. 370—32.1 **25 Claims**

1. An echo cancellation modem for receiving data signals from a remote device over a channel in accordance with one of several possible modulation schemes suitable for different channel qualities, respectively, while simultaneously sending data signals to the remote device over the same channel, said modem comprising

an echo canceller for reducing echo components appearing in the received channel signal to produce an echo reduced received channel signal having a residual echo component,

a monitor for determining the quality of the channel based on an analysis of the residual echo component, and

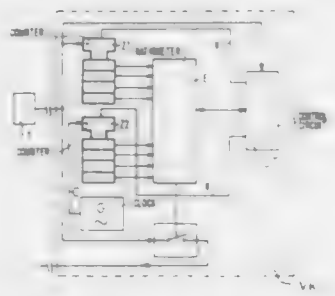
a controller for selecting an acceptable one of said modulation schemes based on the analysis of said monitor.

5,007,048

CIRCUIT ARRANGEMENT FOR AVOIDING OVERLOAD IN A WIDEBAND SWITCHING SYSTEM

Wolfgang Kowalk, Nürnberg, Fed. Rep. of Germany, assignor to U.S. Philips Corporation, New York, N.Y.

Filed Sep. 29, 1988, Ser. No. 251,632



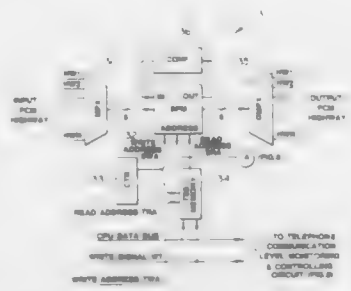
Int. Cl.[5] H04Q *11/04*

U.S. Cl. 370—60 **8 Claims**

1. A circuit arrangement for avoiding overload in a wideband switching system, in which messages are subdivided into blocks and transmitted over wideband transmission links according to an a synchronous time-division multiplex method, comprising:

block counter means for counting the blocks sent by a subscriber station;

connection time counter means for determining the connection time accumulated during the existing condition, and



monitoring means connected to the block counter and the connection time counter for monitoring the usage of the switching system.

5,007,049

ELECTRONIC EXCHANGE HAVING A CONFERENCE TELEPHONE COMMUNICATION FUNCTION AND CONFERENCE TELEPHONE COMMUNICATION METHOD

Eiji Ohtsuka, Hino, Japan, assignor to Kabushiki Kaisha Toshiba, Kawasaki, Japan

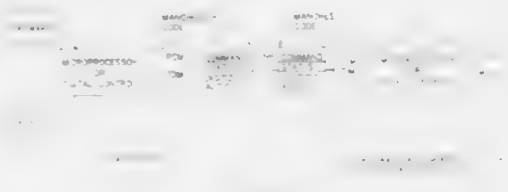
Filed Mar. 22, 1989, Ser. No. 327,276
Claims priority, application Japan, Mar. 25, 1988, 63-69612
Int. Cl.[5] H04M *3/56*
U.S. Cl. 370—62 **5 Claims**

1. A conference telephone communication method in which telephone communication signals on a plurality of speakers in a time sharing multiplexed telephone communication path are added, the telephone communication signal on any particular speaker is subtracted, and the resulting signal is transferred to the remaining respective speakers, comprising the steps of:

monitoring the levels of the telephone communication signals transferred to the remaining respective speakers,

selectively attenuating the telephone communication signals, the levels of which have exceeded a preset threshold level,

transferring the attenuated signals to the remaining speakers, and



releasing the selective attenuation of the telephone communication signals, which have exceeded the threshold level, a predetermined time after conditions under which the threshold level is exceeded have disappeared.

5,007,050

BIDIRECTIONAL DIGITAL SERIAL INTERFACE FOR COMMUNICATION DIGITAL SIGNALS INCLUDING DIGITIZED AUDIO BETWEEN MICROPROCESSOR-BASED CONTROL AND TRANSCEIVER UNITS OF TWO-WAY RADIO COMMUNICATIONS EQUIPMENT

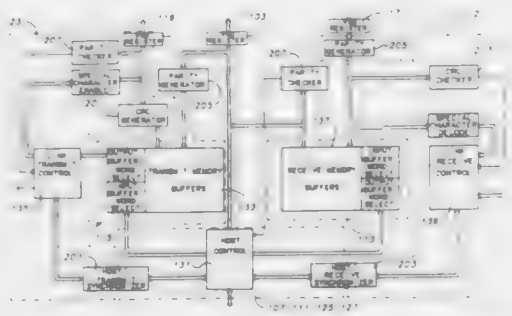
Kaspar A. Kasparian, Raleigh; Aaron S. Rogers, Knightdale; Ming-Chyuan Hsu, and John P. Fussell, both of Raleigh, all of N.C., assignors to Teletec Corporation, Raleigh, N.C.

Filed Mar. 27, 1987, Ser. No. 31,003
Int. Cl.[5] H04J *3/00*
U.S. Cl. 370—77 **29 Claims**

1. A digital serial communications link comprising:

(a) a first time division multiplexed full duplex digital interface for a two-way radio having a means for transmitting and receiving time-division multiplexed pulse code modulation signals;

(b) a second time division multiplexed full duplex digital interface for a two-way radio having a means for transmitting and receiving time-division multiplexed pulse code modulation signals; and



(c) a bidirectional time division multiplexed full duplex communicating medium connecting said first time division multiplexed full duplex digital interface with said second time division multiplexed full duplex digital interface.

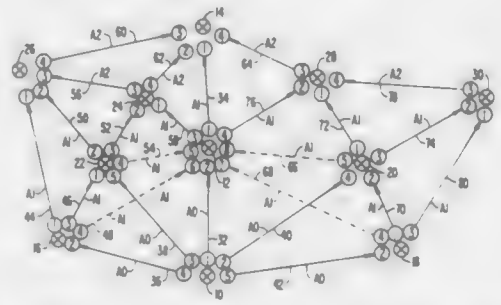
5,007,051

LINK LAYER PROTOCOL AND APPARATUS FOR DATA COMMUNICATION

Gregory D. Dolkas, Auburn, and William R. Martin, Roseville, both of Calif., assignors to Hewlett-Packard Company, Palo Alto, Calif.

Continuation of Ser. No. 103,485, Sep. 30, 1987, abandoned. This application Mar. 3, 1989, Ser. No. 319,897
Int. Cl.[5] H04L *5/22*
U.S. Cl. 370—85.1 **12 Claims**

1. A method for controlling data transmission using an open systems interconnection model, comprising:



providing link layer sliding window protocol formatting of information to be transmitted such that said protocol provides transmission flow control.

5,007,052

METHOD FOR ROUTING PACKETS BY SQUELCHED FLOODING

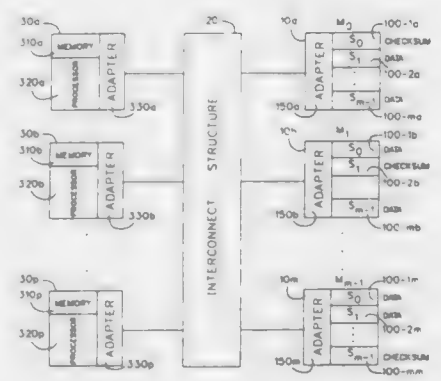
George Flammer, San Jose, Calif., assignor to Metricom, Inc., Campbell, Calif.

Filed Apr. 11, 1989, Ser. No. 337,031
Int. Cl.[5] H04J *3/26*
U.S. Cl. 370—85.6 **8 Claims**

1. In a packet-switched communication network, a method for routing flooding packets to nodes in said network, said method comprising the steps of:

assigning at each local node a link sequence value to each communication link with said local node;

exchanging between each said local node and each remote nodes said link sequence value assigned to a common communication link such that each said local node is advised of the link sequence value assigned by each remote node to a communication link with said local node; and



transmitting flooding packets only via communication links having link sequence values with a priority above a link sequence value threshold.

5,007,053

METHOD AND APPARATUS FOR CHECKSUM ADDRESS GENERATION IN A FAIL-SAFE MODULAR MEMORY

Balakrishna R. Iyer, Fremont, Calif.; Daniel M. Dias, Mahopac, N.Y., and Yitzhak Dishon, Stamford, Conn., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Nov. 30, 1988, Ser. No. 278,104
Int. Cl.[5] G06F *11/10*
U.S. Cl. 371—21.1 **14 Claims**

1. A method for providing fault tolerance for a memory for a computer system comprised of a plurality of memory modules having a plurality of groups of blocks, said groups of blocks being comprised of at least one backup block for storing checksums and a plurality of data blocks for storing data, said blocks in each of the said memory modules having various address labels, and wherein a unit of access is no greater than a block, said method comprising the steps of;

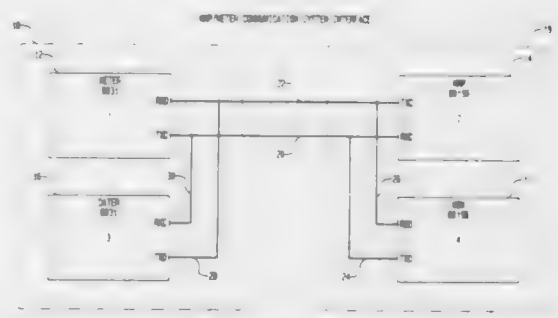
distributing said backup blocks for different groups of data blocks across said memory modules;

providing an address generator to identify the address label of the data in a data block and the address label of said data block's backup block;

calculating a checksum of the data in all of said data blocks of a group of blocks;

storing said checksum in an identified backup block having an identified address label;

detecting failure of a memory module; and



recovering the data in each one of the data blocks in said failed memory module from the other blocks in non-failed memory modules.

5,007,054

NETWORK AND PROTOCOL FOR REAL-TIME CONTROL OF MACHINE OPERATIONS

David K. Lee, Monroe, and Peter C. DiGiulio, Bridgeport, both of Conn., assignors to Pitney Bowes Inc., Stamford, Conn.

Filed Dec. 28, 1988, Ser. No. 291,477
Int. Cl.[5] G06F *11/00*
U.S. Cl. 371—32 **4 Claims**

1. A communication network, comprising:

a first, second, third and fourth controller node;

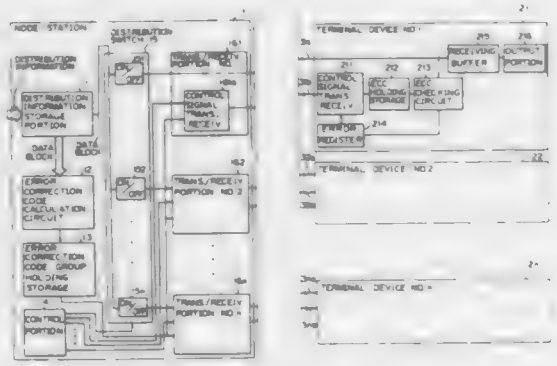
each of said controller nodes respectively having a transmit and receive pin and a processor means for generating data message at said transmit pin and receiving data messages received at said receive pin, said transmit pin of said first node in line communication with the receive pin of said second and third nodes and the transmit pin of said fourth node having said receive pin of said first node in line communication with said transmit pin of said second and third node and the receive pin of said fourth pin;

said processor means being programmable to respond to and generate data message bytes, each data byte having a start bit, eight data bits, a ninth programmably settable bit and one stop bit;

said processor means being further programmable to respond only to a unique address-command data message byte, said address-command byte having said ninth settable bit set, said processor means to then generate in response to said address-command byte a reply message byte with the ninth bit not set, said processor to then receive a message count byte followed uninterrupted by said data message bytes, said count byte and said data message bytes having the ninth bit not set, said processor upon receiving a complete data message conforming to the received count of said count by to then generate an acknowledgement byte;

said processor means of said first and second controller being further programmable to generate a unique address-command data message byte, said address-command byte having said settable bit set, said processor means to then respond to a reply message byte, said reply message to have said ninth bit not set, said processor to then transmit a message count byte followed uninterrupted by the data message bytes, said count byte and said data message bytes having the ninth bit not set, said processor to then receive

an acknowledgement byte indicating whether the received message was error free;



said processor means of said third controller node being further programmable to generate a data message byte only in response to a data message from said first node, said processor means to then generate a message count byte followed uninterrupted by a data message byte, said count byte and said data message bytes having the ninth bit not set, said processor to then receive an acknowledgement byte indicating whether the received message was error free.

5,007,055

INFORMATION DISTRIBUTION SYSTEM

Osamu Isono; Toshimasa Fukui; Tetsuo Nishino; Tetsuo Tachibana, all of Kawasaki, and Eisuke Iwabuchi, Yokohama, all of Japan, assignors to Fujitsu Limited, Kawasaki, Japan

Filed Feb. 24, 1989, Ser. No. 314,792
Claims priority, application Japan, Feb. 25, 1988, 63-40820
Int. Cl.[5] G08C *25/02*
U.S. Cl. 371—32 **2 Claims**

1. An information distribution system, comprising:

a node station;

a plurality of transmission lines; and

a plurality of terminal devices connected through said transmission lines to said node station;

said node station comprising:

distribution storage means for storing information which is to be distributed to said plurality of terminal devices;

error check code formation means for forming error check code information based upon the information;

distribution means for selectively distributing the information from said distribution storage means;

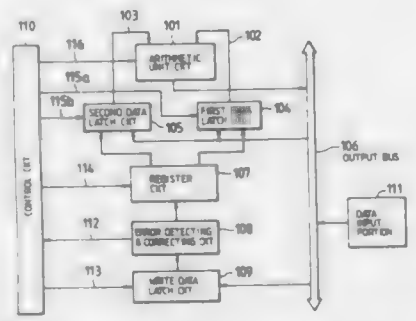
transmitting/receiving means for transmitting a set-up signal, the error check code information and the information to said plurality of terminal devices and for receiving retransmission requests from said plurality of terminal devices;

control means for providing the set-up signal and the error check code information before transmitting the information from said node station to said terminal devices; and

re-transmission request response means for retransmitting the information in response to one of the re-transmission requests from one of said plurality of terminal devices;

each of said terminal devices comprising,

error checking means for receiving the information and the checking whether the information received from said node station is correct;



means for dividing the information transmitted from said node station into a plurality of blocks, and for transmitting the retransmission request based on the checking of said error checking means.

5,007,056

PROCESSING CIRCUIT HAVING AN ERROR DETECTING AND CORRECTING CIRCUIT THEREIN

Masaitsu Nakajima, Osaka, Japan, assignor to Matsushita Electric Industrial Co., Ltd., Japan

Filed Dec. 27, 1988, Ser. No. 289,708
Claims priority, application Japan, Dec. 25, 1987, 62-330769
Int. Cl.[5] G06F *11/10*
U.S. Cl. 371—37.1 **7 Claims**

7. A processing circuit for receiving input data having an error detecting and correcting code from a data bus, said processing circuit comprising:

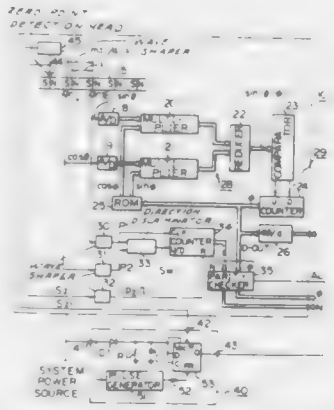
(a) write data latch circuit means connected to said data bus for latching said input data;

(b) error detecting and correcting circuit means responsive to an output signal from said write data latch circuit means for checking said latched data, generating corrected data from said latched data and outputting an error correction signal when said latched data is erroneous;

(c) register circuit means for storing correct data sent from said error detecting and correcting circuit means;

(d) first and second input data latch circuit means, each connected to said data bus and said register circuit means, for temporarily latching said input data from said data bus in the absence of said error correction signal, and for temporarily latching corrected data from said register circuit means in the presence of said error correction signal;

(e) arithmetic unit circuit means coupled to said first and second input data latch means for executing an operation on at least one of said input data and said corrected data that is latched by said first and second input data latch circuit means; and



(f) control circuit means for controlling the operation of said arithmetic unit circuit means to perform a first operation on said input data that is latched by said first and second input data latch circuit means while said error detection and correction circuit means is detecting whether an error occurs in said input data, and said control circuit means controls the operation of said write data latch circuit means, said register circuit means and said first and second data latch circuit means, to prevent the result of said first operation from being output to an output bus and to provide said corrected data to said arithmetic unit circuit means only when said error correction signal is generated, thereby causing said arithmetic unit circuit means to perform a second operation on said corrected data.

5,007,057

POWER SOURCE MONITOR AND A ROTARY ENCODER WITH SUCH A MONITOR

Kenzaburou Iijima, and Yoshinori Hayashi, both of Shizuoka, Japan, assignors to Yamaha Corporation, Japan

Filed Jan. 18, 1989, Ser. No. 298,501
Claims priority, application Japan, Jan. 18, 1988, 63-7808
Int. Cl.[5] G06F *11/10*
U.S. Cl. 371—66 **4 Claims**

1. A power source monitor for a rotary encoder including a parity checker and a zero-point detection head, said rotary encoder being effective for issuing absolute position data, said power source monitor comprising:

a pulse generator connected to a power source for said rotary encoder and effective for generating a pulse signal when an input voltage thereof falls below a predescribed level;

a flip-flop having a preset terminal connected to said pulse generator and a reset terminal connected to the zero-point detection head of said rotary encoder, said flip-flop being preset on receipt of said pulse signal for generation of an alarm signal to be supplied to said parity checker, and being reset on receipt of a zero-point signal for cancelling said alarm signal; and

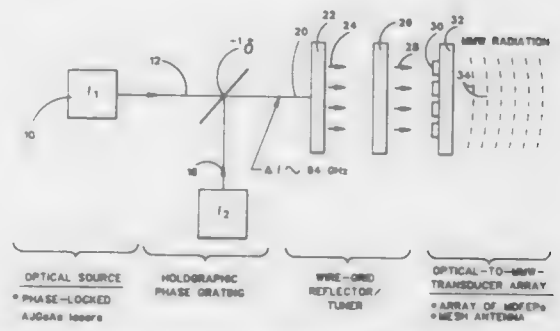
a capacitor connected to said power source and to said flip-flop to supply a constant input voltage to said flip-flop upon the occurrence of an interruption in power supplied by said power source.

5,007,058

MILLIMETER WAVE POWER GENERATOR

Cecil L. Hayes, Placentia; Derek T. Cheung, Thousand Oaks, and Harold R. Fetterman, Pacific Palisades, all of Calif., assignors to Rockwell International Corporation, El Segundo, Calif.

Filed Apr. 11, 1990, Ser. No. 508,071
Int. Cl.[5] H01S *1/00*
U.S. Cl. 372—4 **12 Claims**



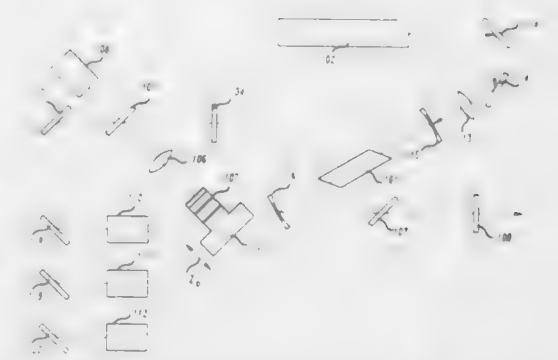
1. A millimeter wave power generator, comprising:

a source of first frequency optical radiation;

a source of second frequency optical radiation, interfering with said first frequency optical radiation and tuned to produce beat frequency optical radiation upon said interference, said beat frequency optical radiation having a preselected millimeter wave beat frequency;

means for separating said beat frequency optical radiation into a plurality of beams;

a plurality of externally powered optical-to-millimeter wave transducers, each of which is respectively driven by the beat frequency of one of said beams; and



a plurality of antennas, each of which extends between and is driven by a respective pair of said transducers.

5,007,059

NONLINEAR EXTERNAL CAVITY MODELOCKED LASER

Ursula Keller, Atlantic Highlands, and Wayne H. Knox, Rumson, both of N.J., assignors to AT&T Bell Laboratories, Murray Hill, N.J.

Filed May 15, 1990, Ser. No. 523,622
Int. Cl.[5] H01S *3/098*
U.S. Cl. 372—18 **16 Claims**

1. An optical device comprising a laser for generating an optical beam at a first wavelength and a nonlinear external cavity means coupled optically to said laser for inducing modulation of said optical beam to modelock said optical beam, said nonlinear external cavity means including remote reflector means responsive to said optical beam for reflecting and nonlinearly varying a predetermined parameter of said optical beam.

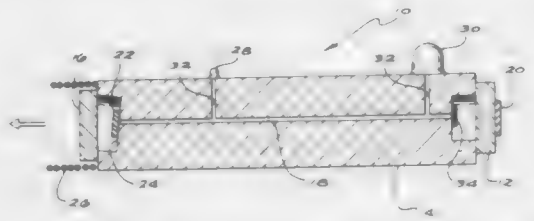
5,007,060

LINEAR LASER WITH TWO-SWEPT FREQUENCIES OF CONTROLLED SPLITTING

David B. Hall, La Crescenta, Calif., assignor to Litton Systems, Inc., Beverly Hills, Calif.

Filed Aug. 1, 1989, Ser. No. 389,370
Int. Cl.[5] H01S *3/10*
U.S. Cl. 372—23 **16 Claims**

1. A dual frequency coherent radiation source, comprising:



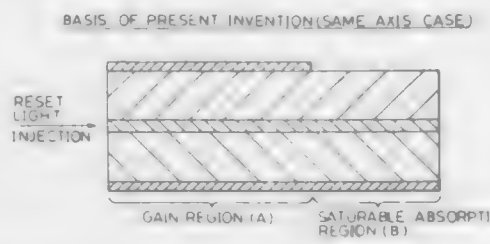
a resonant cavity defining a linear optical axis;

a faraday rotator, disposed within the resonant cavity;

magnetic means for generating a magnetic field at the faraday rotator; and

means for varying an optical path length within the resonant cavity, wherein the output of the resonant cavity simultaneously includes coherent radiation of two differing fre-

quencies having a separation generally independent of a resonant frequency of the cavity and wherein the spacing



between the differing frequencies remains generally constant as the cavity length is varied.

5,007,061

BISTABLE SEMICONDUCTOR LASER DIODE DEVICE

Tetsufumi Odagawa, Ebina, Japan, assignor to Fujitsu Limited, Kawasaki, Japan

Filed Jul. 28, 1989, Ser. No. 386,266
Claims priority, application Japan, Jul. 28, 1988, 63-188925; Jan. 13, 1989, 1-6234
Int. Cl.[5] H01S *3/10, 3/19*
U.S. Cl. 372—25 **17 Claims**

1. A bistable semiconductor laser diode device comprising a laser which emits a lasing light at a predetermined lasing wavelength and is responsive to a reset light irradiated thereon by a light irradiation means to stop the emission of the lasing light therefrom, said laser comprising a laminated semiconductor structure having first and second, outer main surfaces and plural laminated layers therebetwen including an active layer comprising a gain region in which stimulated emission occurs thereby to afford an optical gain and a saturable absorption region in which no stimulated emission occurs thereby not to obtain an optical gain at the predetermined lasing wavelength, a first electrode provided on said first main surface, and second electrodes provided on said second main surface in correspondence with said gain region of said active layer, and means for supplying a bias current to said first and second electrodes and thereby through said laminated laser structure, resetting of said laser being carried out by irradiating a light from said irradiating means onto said gain region of said laser, said light having a wavelength in accordance with which said light, as thus irradiated onto the gain region, is amplified by stimulated emission thereby to reduce carriers in said gain region of said active layer of said laser.

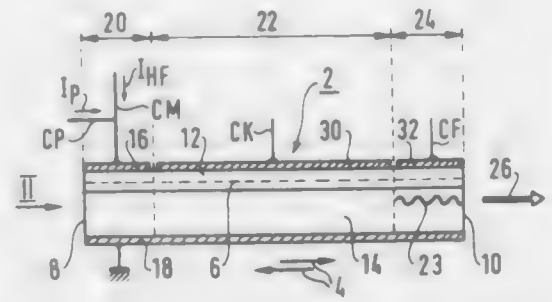
5,007,062

SEMICONDUCTOR LASER SOURCE MODULATED AT HIGH FREQUENCY

José Chesnoy, Paris, France, assignor to Alcatel N.V., Amsterdam, Netherlands

Filed Sep. 6, 1989, Ser. No. 403,745
Claims priority, application France, Sep. 8, 1988, 88 11741
Int. Cl.[5] H01S *3/10*
U.S. Cl. 372—26 **13 Claims**

1. A semiconductor laser source modulated at high frequency, comprising:



a monolithic plate having two opposite end faces, said plate being made of a selectively doped semiconductor material defining two opposing bias layers of different conductivity types and a light channel between said layers and extending between the two said end faces having a refractive index lower than that of the surrounding semiconductor material in order to guide light waves along the length of said light channel;

amplification injection means for injecting DC bias current into said plate to give rise to population inversion in said light channel so as to amplify said light waves therein with a possible positive overall amplification, lightwaves lie in a predetermined gain spectrum range having a predetermined gain spectrum width;

two reflectors each carried on a respective one of said two end faces at a respective end of said light channel for defining an optical cavity including said light channel and having an optical cavity length L such that said cavity is resonant in a succession of modes for light waves having a corresponding succession of resonant frequencies, said frequencies being separated at intervals equal to an intermode frequency

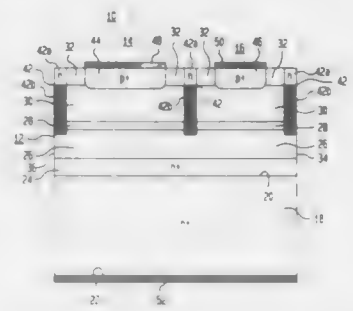
$$f_i = c/2L$$

where c is the speed of light, such that such cavity constitutes a laser oscillator for producing light waves at frequencies close to those of said resonant frequencies which lie within said gain spectrum range, the optical length of the cavity L being limited by the length of said light channel to a value corresponding to a intermode frequency in the microwave range;

modulation injection means for injecting an AC modulation current having a predetermined modulation frequency through a gain modulation section of said light channel located at one end thereof and extending over a minority fraction of the length of said light channel, in order to cause an alternating gain component to appear therein, said modulation frequency being close to said intermode frequency in order to produce said light waves in the form of a modulated carrier wave with at least one modulation component of said wave constituting an output modulation signal having said predetermined modulation frequency and lying in the microwave frequency range whereby said modulation signal constitutes a microwave frequency output signal;

dispersion limitation means disposed in said optical cavity to limit the group propagation time dispersion of said light waves in said cavity; and

a filter in said optical cavity so that said laser oscillator can produce said light waves only within a filtering spectrum range having an associated filtering width which is less than half said gain spectrum width while still being greater than said intermode frequency, thereby avoiding frequency instabilities in said waves produced by said laser oscillator;



wherein said gain modulation imposes a predetermined phase to said output microwave frequency signal relative to said modulation current.

5,007,063

LASER DIODE

Keith B. Kahen, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y.

Filed Feb. 12, 1990, Ser. No. 478,856
Int. Cl.[5] H01S *3/19*
U.S. Cl. 372—45 **24 Claims**

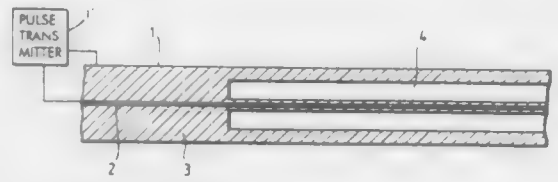
1. In a laser diode comprising:

a body of a semiconductor material having a pair of spaced end surfaces;

an active layer in said body extending between said end surfaces;

means for dielectrically dividing the active layer into two sections;

means at one of said sections for generating light in the active layer of said one section; and



means at the other section for selectively shifting the exciton absorption spectrum of the active layer between predominantly absorbing either the TE or TM modes.

5,007,064

GAS LASER

Nigel Seddon, Filton, United Kingdom, assignor to British Aerospace plc, Bristol, England

Filed Jul. 19, 1989, Ser. No. 382,121
Claims priority, application United Kingdom, Jul. 20, 1988, 8817308
Int. Cl.[5] H01S *3/22, 3/223*
U.S. Cl. 372—55 **11 Claims**

1. A gas laser comprising:

an optical cavity;

a coaxial transmission line at least partially disposed in said optical cavity;

a lasant gas disposed in said cavity at least partially surrounding said transmission line;

means for transmitting at least one electrical pulse progressively along said transmission line and for generating a travelling wave of ionization to pump the lasant gas.

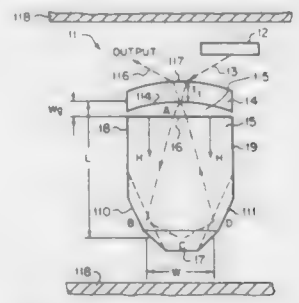
5,007,065

BILITHIC UNIDIRECTIONAL RING LASER

William R. Trutna, Jr., Atherton, Calif., assignor to Hewlett-Packard Company, Palo Alto, Calif.

Filed Aug. 19, 1988, Ser. No. 234,432
Int. Cl.[5] H01S *3/083*
U.S. Cl. 372—94 **11 Claims**

1. A bilithic laser resonator comprising:



a first block;

a second block, separated by a gap of width W_g from the first block;

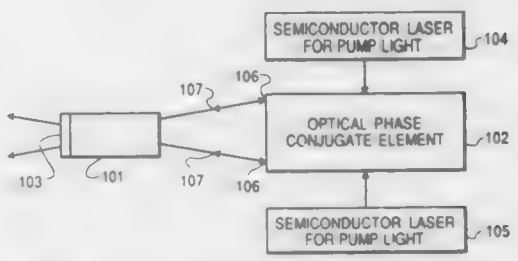
at least one of said first and second blocks being of a material capable of lasing;

at least one of said first and second blocks being of a material capable of producing Faraday rotation of an optical beam travelling therein;

means for varying the width W_g of said gap;

means for defining, within a region consisting of the first and second blocks and the gap between these two blocks, a resonant unidirectional ring that includes at least four non-coplanar reflection vertices

input means for injecting an input beam of light into said ring to pump the laser; and



output means for extracting an output laser beam from light in said unidirectional ring.

5,007,066

SEMICONDUCTOR LASER APPARATUS

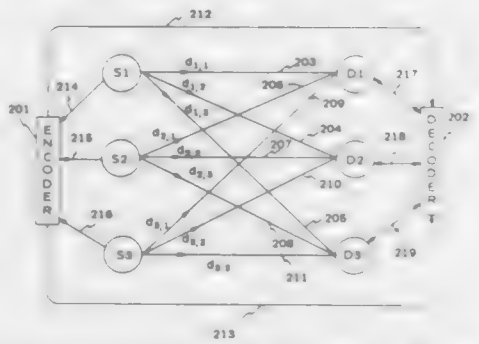
Kazuo Eda, Nara, Japan, assignor to Matsushita Electric Industrial Co., Ltd., Osaka, Japan

Filed Jan. 12, 1990, Ser. No. 464,001
Claims priority, application Japan, Jan. 12, 1989, 1-5224
Int. Cl.[5] H01S *3/08*
U.S. Cl. 372—108 **6 Claims**

1. A semiconductor apparatus comprising:

a semiconductor laser emitting a light beam, said laser having, as an external cavity, a quadruple light wave mixing optical phase conjugate element inverting a spatial phase of an incident light beam from said semiconductor laser; and

a pair of semiconductor laser pump light sources each emitting a pump light beam;



wherein a superimposed portion of spectra of wavelengths from three light beams including said two pump light beams emitted from said pair of pump light sources and entering into said optical phase conjugate element and another light beam emitted from said semiconductor laser and entering into said optical phase conjugate element is narrower than the spectral width of wavelengths of each of said three light beams individually.

5,007,067

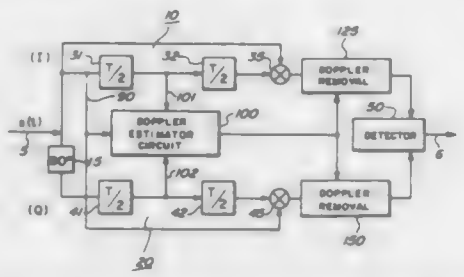
DIVERSITY CODING FOR TRANSPARENT SELF-HEALING COMMUNICATIONS NETWORKS

Ender Ayanoglu, Atlantic Highlands; Richard D. Gitlin, Little Silver; Chih-Lin I, Red Bank, and James E. Mazo, Fair Haven, all of N.J., assignors to AT&T Bell Laboratories, Murray Hill, N.J.

Filed Sep. 29, 1989, Ser. No. 414,874
Int. Cl.[5] H04B *07/02;* **H04L** *01/02*
U.S. Cl. 375—40 **14 Claims**

1. In a communications system comprising a plurality of N independent data streams and a plurality of N + M communications links, a method of providing protection against the failure of up to M of the N + M communications links, M > 1, comprising the steps of:

(a) encoding the N independent data streams to generate N + M separate coded streams, any N of which may be used to decode the N independent data streams; said step of encoding including the step of generating a matrix product GD where D is a vector comprising N digital data symbols, one digital data symbol from each of the data streams, and G is a matrix comprising M + N rows, each row comprising N digital elements;



(b) transmitting each of the N + M coded streams over a separate one of the N + M communications links.

5,007,068

DOPPLER-CORRECTED DIFFERENTIAL DETECTION SYSTEM

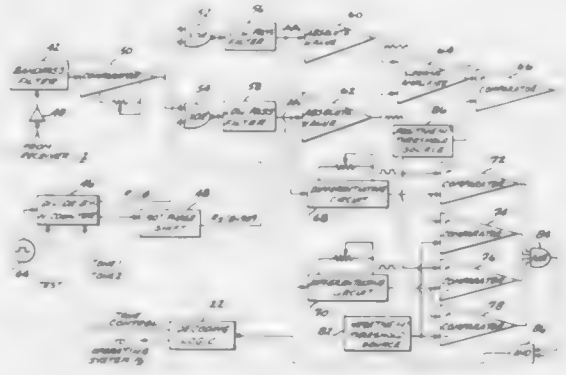
Marvin K. Simon, La Canada, and Dariush Divsalar, Pacific Palisades, both of Calif., assignors to The United States of America as represented by the Administrator of the National Aeronautics and Space Administration, Washington, D.C.

Filed Jun. 7, 1988, Ser. No. 203,374
Int. Cl.[5] H04B *1/10*
U.S. Cl. 375—53 **31 Claims**

1. A receiver in a communication system which produces a Doppler effect in an incoming multiple differential phase-shift-keyed signal having a given symbol interval, with the receiver for the incoming signal having a differential detector for restoring the data by multiplying the incoming signal with a full symbol interval delayed version of itself (or an equivalent sampled version thereof) and applying the restored signal to the detector's output, said receiver comprising:

means for delaying the incoming data signal (which has the Doppler effect therein) by a half symbol interval;

means in an open-loop forward acting circuit for estimating the amount of the Doppler effect from the incoming data signal and the half-symbol delayed signal; and



means for subtracting the estimated Doppler amount from the detector's output.

5,007,069

DECODING OF SIGNALS USING COPHASE AND DIFFERENTIATING SIGNAL DETECTION

David W. VanEss, Arlington, Wash., assignor to Talkie Tooter Inc., Sedro Woolley, Wash.

Filed Nov. 13, 1987, Ser. No. 120,594
Int. Cl.[5] H04L *27/14, 27/16*
U.S. Cl. 375—80 **22 Claims**

1. A method of detecting whether the frequency f_i of an input signal is within some frequency range defined with respect to the frequency f_r of a reference signal, said method comprising the steps of:

producing a difference signal having a frequency Δf equal to the difference between frequencies f_i and f_r;

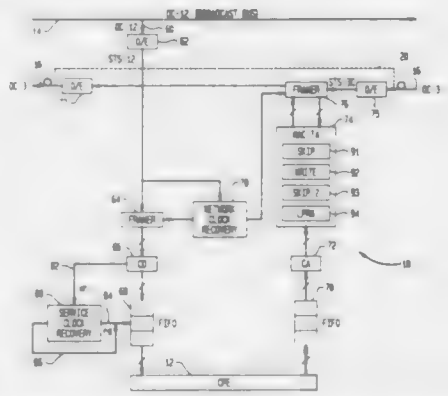
employing information about said difference signal at more than one phase angle to determine whether the frequency Δf is less than some first value f_{c1};

employing information about the slope of said difference signal to determine whether the frequency Δf is less than some second value f_{c2}; and

providing a detection output when the frequency difference Δf is less than f_{c1} and less than f_{c2}.

5,007,070

SERVICE CLOCK RECOVERY CIRCUIT



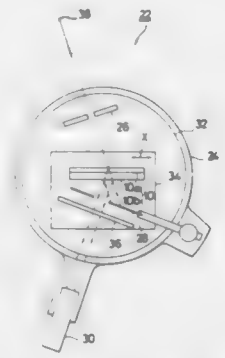
Hung-Hsiang J. Chao, Lincroft, and Cesar A. Johnston, Chatham, both of N.J., assignors to Bell Communications Research, Inc., Livingston, N.J.

Filed Oct. 31, 1989, Ser. No. 429,840
Int. Cl.[5] H04L *7/02*
U.S. Cl. 375—118 **3 Claims**

1. A clock recovery circuit for recovering a clock signal from information transmitted asynchronously to a buffer having a capacity of a multiplicity of bytes, comprising a phase detector for receiving a first sequence of pulses indicative of a rate at which data is written into said buffer and a second sequence of pulses indicative of a rate at which data is transferred out of said buffer, said phase detector comprising first and second counters for maintaining counts of the pulses in the first and second sequences, respectively, a subtractor for subtracting said second count from said first count, counter overflow detection means for providing carry inputs from said counters to said subtractor, and a decision circuit responsive to the difference between the first and second counts for producing a signal indicative of the current occupancy of the buffer, said occupancy indicative signal being an up signal which is asserted to increase the frequency of said second sequence of

pulses and a down signal which is asserted to decrease the frequency of said second sequence of pulses,

a voltage controlled oscillator responsive to said occupancy indicative signal of said decision means for producing said second sequence of pulses, and



a filter located between said decision means and said voltage controlled oscillator for converting said up and down signals into a DC voltage.

5,007,071

METHOD OF INSPECTING BONDED WAFERS

Masami Nakano, and Takao Abe, both of Annaka, Japan, assignors to Shin-Etsu Handotai Co., Ltd., Tokyo, Japan

Filed Oct. 16, 1989, Ser. No. 421,756
Claims priority, application Japan, Oct. 14, 1988, 63-260316
Int. Cl.[5] G01N *23/207*
U.S. Cl. 378—74 **3 Claims**

1. A method of inspecting bonded wafers to determine whether the wafers have been completely bonded together, comprising the steps of:

placing a bonded wafer for inspection into a Lang camera;

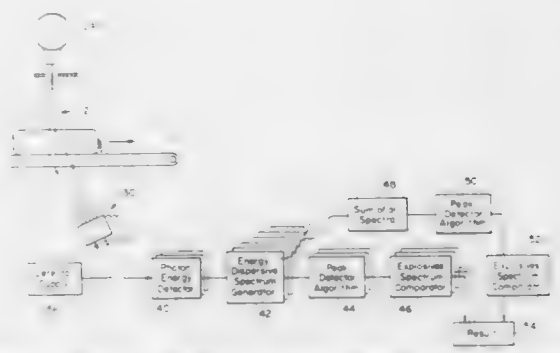
activating an X-ray energy source of high intensity to impinge on the bonded wafer;

adjusting the position of the bonded wafer along one direction while the energy source is impinging thereon; and

obtained a Lang topograph of the bonded wafer.

5,007,072

X-RAY DIFFRACTION INSPECTION SYSTEM



Anthony Jenkins, Medford, Mass., and Peter W. Stephens, Stony Brook, N.Y., assignors to Ion Track Instruments, Wilmington, Mass.

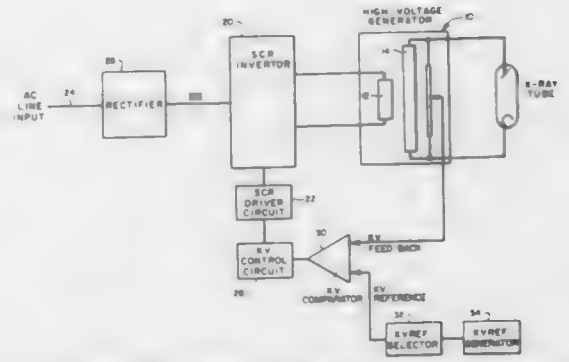
Filed Aug. 3, 1988, Ser. No. 227,722
Int. Cl.[5] G01N *23/201*
U.S. Cl. 378—88 **15 Claims**

1. A method of inspecting parcels to detect the presence of selected crystalline materials in the presence of other crystalline and noncrystalline materials comprising:

generating x-ray radiation from a source;

conveying a parcel containing crystalline and non-crystalline materials to be inspected continuously past the source to irradiate the materials with the radiation;

detecting radiation scattered by crystalline material within the parcel at a predetermined angle; and



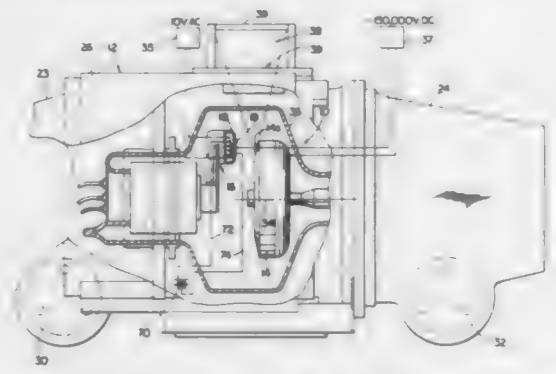
analyzing a spectrum of the detected radiation to detect the presence of a selected crystalline material on or within the parcel.

5,007,073

METHOD AND APPARATUS FOR OBTAINING A SELECTABLE CONTRAST IMAGE IN AN X-RAY FILM

James R. Craig, Glenview, Ill., assignor to Gendex Corporation, Franklin Park, Ill.

Filed Dec. 20, 1989, Ser. No. 454,029
Int. Cl.[5] H05G *1/32*
U.S. Cl. 378—112 **12 Claims**



1. Apparatus for obtaining a selectable contrast image in an X-ray film comprising: high voltage generator circuit means having high voltage primary means for receiving a controlled voltage and high voltage secondary means for applying a controlled high voltage to an X-ray tube; invertor circuit means coupled with said high voltage generator circuit means for applying said controlled voltage to said primary means; driver circuit means responsive to a KV control signal for driving said invertor circuit means such that the voltage applied to said X-ray tube during an exposure is at a level determined by said KV control signal; KV comparator circuit means for comparing a KV feedback signal from said high voltage generator circuit means with a KV reference signal and for developing said KV control signal in accordance with said comparison; and reference signal selector circuit means for selecting any of a plurality of variable level KV reference signals which change in level during an exposure for application to said KV comparator circuit means.

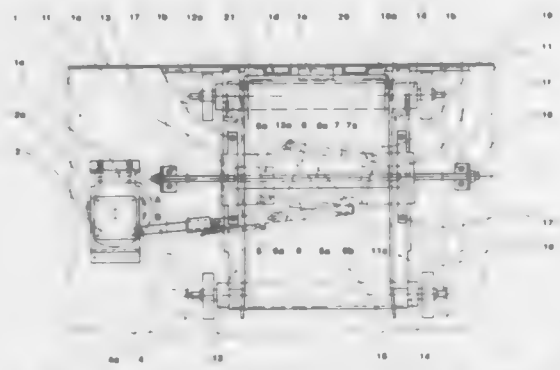
5,007,074

X-RAY TUBE ANODE FOCUSING BY LOW VOLTAGE BIAS

Avery D. Furbee, Elmhurst; Carl F. Bauer, Chicago, and John S. Ramos, Buffalo Grove, all of Ill., assignors to Picker International, Inc., Cleveland, Ohio

Filed Jul. 25, 1989, Ser. No. 385,004
Int. Cl.[5] H01J 35/14
U.S. Cl. 378—138 19 Claims

1. An x-ray tube including a filament, an anode, a cathode focusing cup proximate the filament, means for applying a DC potential difference between the cathode focusing cup and the anode, means for applying a heating current to the filament, and an envelope enclosing the filament, anode and cup, said x-ray tube further comprising:



a battery having a voltage of nor more than about 30 volts and coupling means for applying a DC bias voltage from said battery between said filament and said focusing cup.

5,007,075

HOLD-DOWN DEVICE FOR A CASSETTE

Bernd Mirlieb, Fellbach, and Heinrich Killguss, Kornwestheim, both of Fed. Rep. of Germany, assignors to Eastman Kodak Company, Rochester, N.Y.

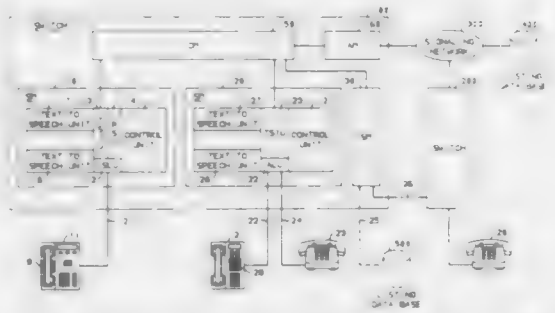
PCT No. PCT/EP88/00403, § 371 Date Nov. 8, 1989, § 102(e) Date Nov. 8, 1989, PCT Pub. No. WO88/09002, PCT Pub. Date Nov. 17, 1988
PCT Filed May 9, 1988, Ser. No. 438,428
Claims priority, application Fed. Rep. of Germany, May 11, 1987, 87/06746
Int. Cl.[5] A61B 6/14; G03B 42/04, 42/02
U.S. Cl. 378—172 2 Claims

1. In x-ray film cassette handling apparatus in which cassettes having upper and lower parts for enclosing the film are centered by parallel lateral edge guide bars and the upper cassette part is raised for loading film into the cassette and unloading film from the cassette; the improvement comprising:

pivoted means carried by said edge guide bars and engageable with lateral edges of a cassette for holding the lower cassette part down when the upper part is raised,

means for biasing said pivoted means toward the cassette,

said pivoted means having a first portion for overlying an edge of the lower cassette part to hold down that part, and a second portion to engage the upper cassette part,



said second portion of said pivoted means extending above said edge guide bars and having upwardly diverging inclined surfaced facing the cassette edges, which surfaces are engaged by the lateral edges of said upper cassette part when said part is raised, downward closing movement of said upper cassette part exerting separating pressure on said diverging surfaces, causing said pivoted means to retract said first portion away from said cassette.

5,007,076

CALL ANNOUNCEMENT ARRANGEMENT

James R. Blakley, Chicago, Ill., assignor to AT&T Bell Laboratories, Murray Hill, N.J.

Continuation-in-part of Ser. No. 230,224, Aug. 8, 1988, Pat. No. 4,899,358. This application Nov. 3, 1989, Ser. No. 431,586
Int. Cl.[5] H04M 1/57, 3/50
U.S. Cl. 379—67 15 Claims

1. A method of processing a call from a calling communication station to a called communication station comprising

in response to said call, effecting a search for information associated with said calling station,

determining whether said called station is busy on another call,

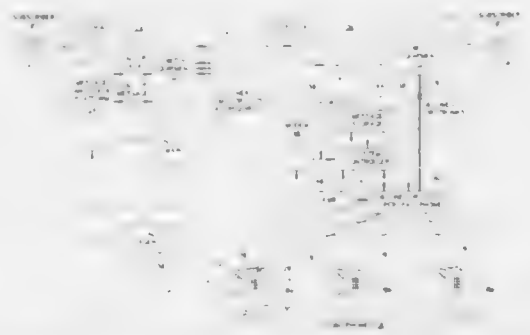
after determining that said called station is busy on another call, transmitting a call waiting signal to said called station,

after transmitting said call waiting signal and in response to receipt of a predefined signal from said called station, disconnecting a communication path between a calling communication station for said another call and said called station,

after disconnecting said communication path, transmitting speech signals, generated from information obtained during said search, to said called station, and

after transmitting said speech signals to said called station and in response to receipt of a prespecified signal from said called station, completing a communication path between said first-mentioned calling station and said called station.

5,007,077



COIN TELEPHONE MESSAGE AND MANAGEMENT SYSTEM

Gary C. Fields; Mark E. Stamos, both of Oakland, and Lawrence T. Pena, San Carlos, all of Calif., assignors to Conway Engineering, Inc., Oakland, Calif.

Filed Mar. 23, 1990, Ser. No. 498,263
Int. Cl.[5] H04M 11/08, 3/42, 17/00
U.S. Cl. 379—67 18 Claims

1. A coin telephone message and management system for use at a central office location of a telephone system with a plurality of conventional remotely located coin telephone stations and an associated automated coin subsystem to which the coin telephone stations are connected by coin trunks, the coin telephone message and management system comprising:

a plurality of programmable line interface unit means each being connected to a said coin trunk for monitoring electrical signals present on the coin trunk indicative of usage of the station connected thereto, for delivering messages to a user of the station, and for generating electrical signals emulative of operation of the station for thereby controlling the automated coin subsystem,

message storage and delivery means selectively connectable to a said programmable line interface unit means for delivering at least one selectable audio message to the user of a said station via the coin trunk, and

system controller means for coordinating operations of the programmable line interface unit means and the message storage and delivery means.

5,007,078

AUTOMATED ORDER ENTRY RECORDING METHOD AND APPARATUS

Ronald K. Masson, Topanga, and Michael W. Edelson, Simi Valley, both of Calif., assignors to American Communications & Engineering, Inc., Simi Valley, Calif.

Filed Apr. 28, 1989, Ser. No. 344,666
Int. Cl.[5] H04M 1/65
U.S. Cl. 379—75 8 Claims

1. An apparatus for automatically transcribing information provided by a telephone caller to an automated message exchange system, said apparatus comprising:

(a) line connection means for connecting to an incoming telephone call;

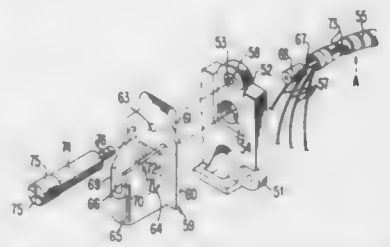
(b) first signal processing means coupled to said line connected means for receiving and digitally storing the voice information provided by the caller;

(c) second signal processing means for retrieving said digitally stored voice information and generating a verbal representation thereof;

(d) third signal processing means for receiving touch tone codes provided by the caller and digitally storing information conveyed by said touch tone codes;

(e) fourth signal processing means for retrieving said digitally stored touch tone coded information and generating a verbal representation thereof;

(f) an audio recording device having an audio input for receiving an audio signal to be recorded; and



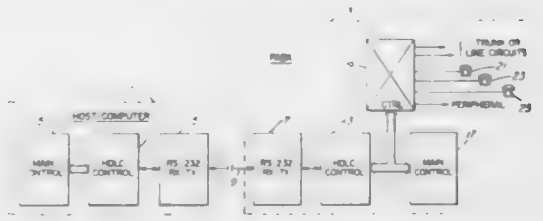
(g) control means coupled to said audio recording device for automatically placing said audio recording device in a recording mode and for applying said verbal representation of said digitally stored voice information and said verbal representation of said touch tone coded information to said audio input of said audio recording device.

5,007,079

COIN FRAUD PREVENTION UNIT AND MODULAR CONFIGURATIONS FOR PAY TELEPHONE STATIONS

Allen W. Vogl, Melbourne; Steven C. Poe, West Melbourne; John H. MacNeill, Indialantic, and Douglas J. Buron, Micco, all of Fla., assignors to International Teleservice Corporation, Melbourne, Fla.

Division of Ser. No. 407,947, Sep. 15, 1989, Pat. No. 4,918,724. This application Oct. 20, 1989, Ser. No. 424,560
Int. Cl.[5] H04M 1/15, 17/02, 1/08; G07F 3/02
U.S. Cl. 379—145 20 Claims



8. A device for anchoring a handset to a telephone station through a handset cord assembly, comprising a rigid anchor member having a base with first and second apertures and sloped members extending from the base, wherein edges of the sloped members remote from the base form a slot therebetween.

5,007,080

COMMUNICATION SYSTEM SUPPORTING REMOTE OPERATIONS

Ian MacMillan, Nepean, and Vish Raju, Kanata, both of Canada, assignors to Mitel Corporation, Ontario, Canada

Filed Feb. 1, 1989, Ser. No. 304,472
Claims priority, application Canada, Feb. 4, 1988, 558123
Int. Cl.[5] H04M 3/42
U.S. Cl. 379—269 17 Claims

1. Apparatus for effecting resource allocation remote operations in a pair of communication systems utilizing Open Systems Interconnect communication protocol, comprised of means within respective ones of said communication systems for generating predetermined operation data signals associated with an invoking Application Entity; means for transmitting said data signals between said communication systems in accordance with said protocol; and means within said communication systems for receiving said data signals and in response allocating a server Application Entity performing said remote operations; each of said operation data signals including a n

Invoke Address signal for identifying said Invoking Application Entity, and a Server Address signal for identifying said server Application Entity, whereby said operation data signals are directed to respective ones of said invoking and server Application Entities identified by said Invoke Address and Server Address signals, a first one of said operation data signals being comprised of an invoke operation signal generated by said invoking Application Entity within a first one of said pair of communication systems and transmitted to said server Application Entity within the other of said pair of communication systems for invoking performance of a predetermined one of said remote operations via said server Application Entity.

SPEECH ACTIVATED TELEPHONE

Peter J. Schmuckal, Menlo Park; Mitchell S. Phillips, Sunnyvale; Francis P. Keiper, III, San Jose; James C. Sprout, Los Altos, and Ronald H. Fried, Sunnyvale, all of Calif., assignors to Origin Technology, Inc., Sunnyvale, Calif.

Filed Jan. 5, 1989, Ser. No. 294,168
Int. Cl.[5] H04M *1/272*
U.S. Cl. 379—354 **4 Claims**

MICROFICHE APPENDIX INCLUDED
(448 Microfiche, 5 Pages)

1. A speech activated telephone having means for dialing a pre-stored telephone number, wherein the improvement comprising:

means for inputting a plurality of acoustic commands into said telephone in a training mode;

means for processing said plurality of acoustic commands into a plurality of processed signals;

means for storing said plurality of processed signals;

means for inputting a telephone number and an alphanumeric name associated with each acoustic command, in said training mode;

means for storing said telephone number and said alphanumeric name associated with each acoustic command;

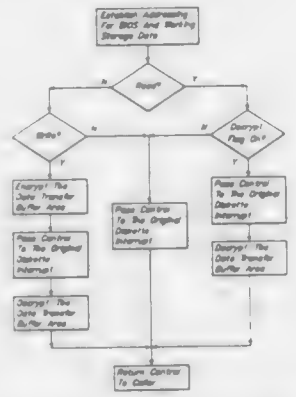
means for receiving a dialing acoustic command in a dialing mode;

means for processing said dialing acoustic command into a voice signal;

means for comparing said voice signal to said stored processed signals;

means for automatically displaying a plurality of alphanumeric names in response to said comparing means being unable to match said voice signal with only one of said stored processed signals;

user activatable switch means for selecting one of said displayed alphanumeric names; and



means for generating a dialing signal representative of the telephone number associated with said selected displayed alphanumeric name in response to said user activatable switch means.

5,007,082

COMPUTER SOFTWARE ENCRYPTION APPARATUS

Marty T. Cummins, Rochester, Mich., assignor to Kelly Services, Inc., Troy, Mich.

Continuation of Ser. No. 227,730, Aug. 3, 1988, Pat. No. 4,937,861. This application Feb. 26, 1990, Ser. No. 484,550
Int. Cl.[5] H04L *9/06*
U.S. Cl. 380—4 **11 Claims**

6. In a computer system having a processor means for operating on data comprising arrangements of binary digits, a power-on routine for causing said processor to scan a predetermined range of memory location addresses for instructions after power-on, means for enabling said processor means to communicate with data storage media comprising first program means including first BIOS input/output program for reading and writing data to a fixed data storage medium and second program means including second BIOS input/output program for reading and writing data to a removable data storage medium, said first and second BIOS input/output programs being selectively invoked by interrupt signals associated with an interrupt vector table stored in read/write memory, a data security system comprising:

security program means disposed within said predetermined range of memory location addresses for automatically altering said second program means during said power-on routine;

said security program means including an encryption BIOS program and a vector table altering program, said vector table altering program being automatically invoked during said power-on routine to alter said interrupt vector table to substitute said encryption BIOS program for at least a portion of said second BIOS input/output program without altering said first BIOS input/output program;

said encryption BIOS program of said security program means transforming data communicated between said removable data storage medium and said processor means such that said data stored on said removable data storage medium is represented using a different arrangement of binary digits than is used when said data is stored in said fixed data storage medium.

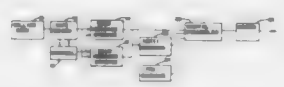
SECURE COMPUTER

James N. Constant, 1603 Danbury Dr., Claremont, Calif. 91711

Continuation of Ser. No. 244,661, Mar. 17, 1981, abandoned. This application Jan. 16, 1985, Ser. No. 692,321
Int. Cl.[5] H04L *9/06, 9/10*
U.S. Cl. 380—9 **61 Claims**

1. A means for protecting information containing at least one

of a central processing unit (CPU) and memory and at least one of an encrypter and decrypter,



said means being temporarily inserted in a computer or information transfer device.

5,007,084

PAYMENT AUTHORIZATION AND INFORMATION DEVICE

Richard H. Materna, 705 St. Joseph Dr., Oak Brook, Ill. 60515; John S. Linse, 9418 Bay Colony Dr., Apt. 3 S., Des Plaines, Ill. 60016, and Roy A. Richardson, Pinellas Park, Fla., assignors to Richard H. Materna, Peoria and John S. Linse, Des Plaines, both of, Ill.

Filed Aug. 29, 1988, Ser. No. 237,894
Int. Cl.[5] H04L *9/06;* **G07F** *7/08*
U.S. Cl. 380—24 **9 Claims**

1. An apparatus for delivering billing information from a supplier to a user and enabling the user to direct payment of his bill, the apparatus comprising:

a. means for reading the billing information;

b. means for scrambling the read billing information;

c. means for telecommunicating the read billing information to a user;

d. means located at the site of the user for selecting read billing information addressed to the user;

e. means for storing the selected read billing information;

f. means for providing the user with a visible indication of the selected read billing information;

g. means for authorizing a transfer of funds to the supplier to pay the bill; and

h. means for communicating address changes and the like from the user to the supplier.

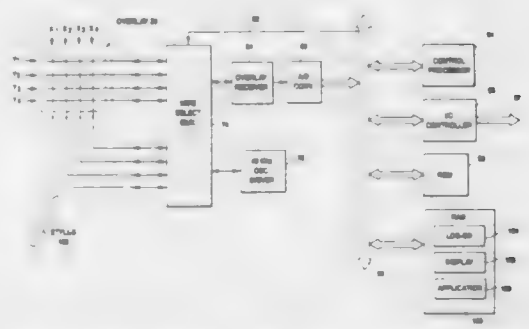
5,007,085

REMOTELY SENSED PERSONAL STYLUS

Evon C. Greanias, Chevy Chase, and Robert L. Donaldson, Annapolis, both of Md., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Oct. 28, 1988, Ser. No. 264,409
Int. Cl.[5] H04L *9/32*
U.S. Cl. 380—25 **37 Claims**

1. A data processing system having at least one workstation equipped with an input system which controls access to said data processing system by validating a security code transmitted by a remotely sensed personal stylus, comprising:



said input system comprising:

radiating means having a control input for radiating electromagnetic signals in an area proximate to said input system;

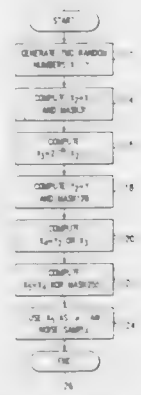
a remotely sensed personal stylus located separate from, but proximate to said workstation, for receiving electromagnetic signals radiated from said radiating means and for transmitting response signals and a security code signal in response thereto, said stylus including a receiving antenna, a means for providing a security code signal and a transmitter;

receiving means having an output for receiving transmission from said remotely sensed personal stylus;

a control processor coupled to said control input of said radiating means for executing a sequence of stored program instructions to output control signals, said control processor coupled to said receiving means for sampling said stylus transmissions to determine stylus location and to receive said security code signal;

program instructions including a log-on module which validates said unique coded signal to allow access to said data processing system;

a central processing unit having a data input coupled to said receiving means which executes a sequence of program instructions in response to data supplied by said stylus transmissions; and,



a workstation display device coupled to said central processing unit for displaying the results of said program instructions to the user.

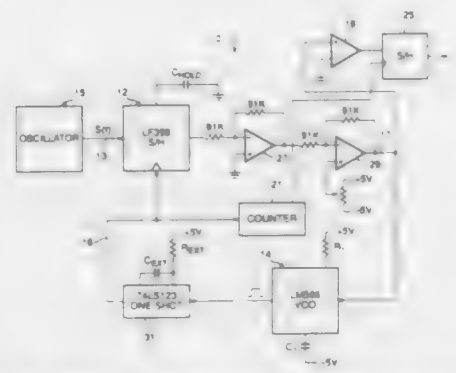
APPARATUS AND METHOD FOR GENERATING LOW LEVEL NOISE SIGNALS

Kishan Shenoi, Milpitas, and Helena S. Ho, San Jose, both of Calif., assignors to DSC Communications Corporation, Plano, Tex.

Filed Jul. 16, 1990, Ser. No. 552,767
Int. Cl.[5] H04L *9/00*
U.S. Cl. 380—46 **45 Claims**

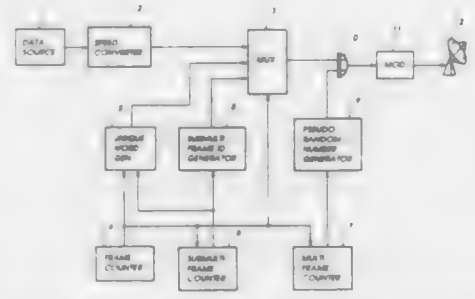


1. A method for generating low level noise samples, comprising the steps of:

producing a first random number having a first predetermined number of bits;

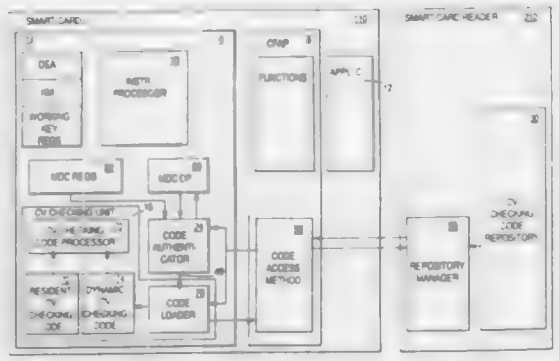
masking out a second predetermined number of most significant bits of said random number and producing a second random number;

adjusting said second random number to achieve a desired power level;
adjusting said adjusted random number to achieve a desired power level granularity; and
randomly generating a sign bit, combining with said adjusted random number and producing a noise sample.



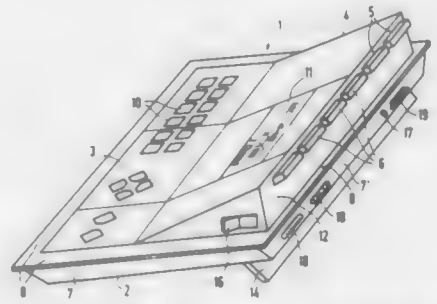
5,007,087
METHOD AND APPARATUS FOR GENERATING SECURE RANDOM NUMBERS USING CHAOS
Greg M. Bernstein, Fremont, and Michael A. Lieberman, Berkeley, both of Calif., assignors to Loral Aerospace Corp., New York, N.Y.
Filed Apr. 16, 1990, Ser. No. 510,359
Int. Cl.[5] H04L 9/04; H03K 3/84
U.S. Cl. 380—46 15 Claims

15. An apparatus for generating a random number from a deterministic circuit comprising:
periodic signal source means for producing a periodic source signal;
first sampling means having a sample control input and a signal input coupled to said periodic signal source means;
variable frequency oscillator means coupled to receive a representation of a sampled output of said first sampling means for generating a binary-valued signal having a frequency and phase state ϕ derived from said sampled output;
feedback means for feeding back in a feedback loop said binary-valued signal to control said sample control input of said first sampling means;
means for constraining operation of said deterministic circuit with a positive Lyapunov exponent through sampling said periodic source signal at sample times determined by level of said binary-valued signal such that operation is chaotic; and
means coupled to a node in said feedback loop for extracting a binary value of a signal in said feedback loop after an interval, in order to form a random number sequence having a preselected degree of uncertainty.



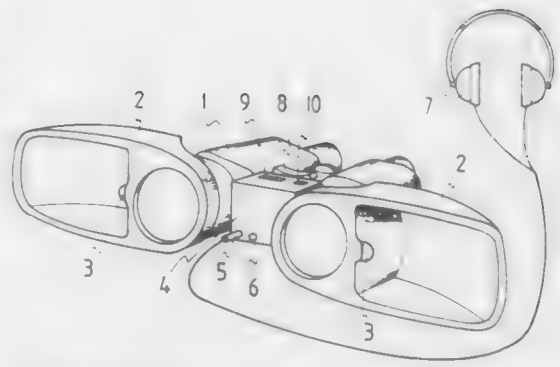
5,007,088
SCRAMBLING/DESCRAMBLING METHOD USING A MEMORY FOR STORING INITIAL PSEUDO-RANDOM BIT PATTERNS RESPECTIVELY FOR SUBMULTIFRAMES
Tomoyuki Ooi; Toshinori Hotta, and Yasuhito Isoe, all of Tokyo, Japan, assignors to NEC Corporation, Japan
Filed Feb. 27, 1989, Ser. No. 316,023
Claims priority, application Japan, Mar. 1, 1988, 63-47902
Int. Cl.[5] H04L 9/00
U.S. Cl. 380—46 7 Claims

1. A method for scrambling data bits at a transmit end of a communications system and descrambling the data bits at a receive end of the communications system, comprising:
(a) successively generating a multiframe composed of a series of submultiframes each containing a series of frames, each of said frames containing data bits, and a sync word for establishing the start timing of the frame, at least one of said frames of each submultiframe containing an identifier for uniquely identifying each of a plurality of specified time points of said multiframe;
(b) generating a pseudo-random number (PN) sequence periodic with a period of said multiframe;
(c) scrambling said data bits of each frame with said PN sequence to said receive end of;
(d) receiving said transmitted frames at said receive end and establishing frame synchronization with the received frames in response to said sync word contained in each of the received frames;



(e) storing a plurality of portions of said PN sequence in a memory, each of said portions being identical to a portion of the PN sequence which was generated at a predetermined point of each transmitted submultiframe;
(f) detecting the identifier from each submultiframe;
(g) reading one of said portions of PN sequence from said memory in accordance with said detected identifier;
(h) generating a PN sequence periodic with a period of said multiframe beginning with said portion read out of said memory; and
(i) descrambling the scrambled data bits contained in each of said sync-established frames with said PN sequence generated by the step (h).

5,007,089
SECURE KEY MANAGEMENT USING PROGRAMABLE CONTROL VECTOR CHECKING
Stephen M. Matyas; Donald B. Johnson; An V. Le, all of Manassas, Va.; William C. Martin, Concord, N.C.; Rostislaw Prymak, Dumfries, and John D. Wilkins, Somerville, both of Va., assignors to International Business Machines Corporation, Armonk, N.Y.
Filed Apr. 9, 1990, Ser. No. 506,319
Int. Cl.[5] H04K 1/00
U.S. Cl. 380—49 16 Claims



12. In a data processing system which includes a control vector based cryptographic facility, an apparatus for providing control vector checking code to be executed in the cryptographic facility, comprising:
a control vector checking code processor in said cryptographic facility, for executing control vector checking code to check control vectors;
a resident control vector checking code buffer in said cryptographic facility for storing resident control vector checking code to be executed by said control vector checking code processor;
a control vector checking code repository coupled to said cryptographic facility, for storing dynamic control vector checking code;
a dynamic control vector checking code buffer in said cryptographic facility, for receiving a portion of said dynamic control vector checking code transmitted from said repository;
said control vector checking code processor, executing said resident control vector checking code to perform a first checking operation on said control vector, and executing said dynamic control vector checking code to perform an augmented control vector checking operation on said control vector.

5,007,090
PROGRAMMING DEVICE FOR HEARING AIDS AND/OR HEARING AID COMPONENTS
Olaf Bransky; Guenter Wiede, both of Erlangen; Fritz-Dieter Stein, and Gerhard Helmreich, both of Effeltrich, all of Fed. Rep. of Germany, assignors to Siemens Aktiengesellschaft, Berlin and Munich, Fed. Rep. of Germany
Filed Oct. 6, 1989, Ser. No. 418,255
Claims priority, application Fed. Rep. of Germany, Oct. 13, 1988, 8812896[U]
Int. Cl.[4] H04R 29/00
U.S. Cl. 381—60 10 Claims

1. A programming device for hearing aids and hearing aid components, comprising:
a trough-shaped housing portion for containing said hearing aid components having a top open end having outer edges;
a cover plate arranged horizontally so as to cover said top open end, said cover plate having outer edges extending beyond said outer edges of said top open end of said trough-shaped housing portion;
a keyboard arrangement situated in a front portion of said cover plate;
a wedge-shaped display panel situated directly on a rear portion of said cover plate with an oblique top side inclined up and away from said front portion; and
at least two plug-in locations in a rear wall of said wedge-shaped display panel for receiving hearing aid program modules.

5,007,091
PROCEDURE AND DEVICE FOR FACILITATING AUDIOVISUAL OBSERVATION OF A DISTANT OBJECT
Esko Alasaarela, Jokirinne; Pekka Adolfsen, Kemi, and Timo Rahkonen, Jyväskylä, all of Finland, assignors to UTK Uuden Teknologian Keskus Oy, Finland
PCT No. PCT/FI88/00060, § 371 Date Oct. 20, 1989, § 102(e) Date Oct. 20, 1989, PCT Pub. No. WO88/08657, PCT Pub. Date Nov. 3, 1988
PCT Filed Apr. 22, 1988, Ser. No. 424,251
Claims priority, application Finland, Apr. 23, 1987, 871793
Int. Cl.[5] H04R 5/027
U.S. Cl. 381—26 8 Claims

1. Device for audiovisual observation of a distant object, said device comprising:
optical means for viewing the object, said optical means including focus control means for adjusting the focus of the optical means; and
listening means for listening to the object, said listening means including
at least two sound receiving means for receiving sounds, said sound receiving means producing output signals,
amplifying means connected to the sound receiving means for amplifying signals from the sound receiving means, and
headphone means connected to the amplifying means for reproducing amplified signals into sounds;
the output signals of the sound receiving means being acoustically or electronically connected so that one of the following applies:
(a) the signals from the sound receiving means are monophonic;
(b) the signals from the sound receiving means are stereophonic;
(c) a spatial stereophonic effect in the signals from the sound receiving means is produced by using an electronic means;
(d) the signals from the sound receiving means are processed in a frequency-dependent manner, so that the signals are monophonic at low frequencies to improve directivity and stereophonic at high frequencies to facilitate location of the object;
said amplifying means being provided with sound volume and tone control means for controlling the volume and tone of the amplified signals, the volume and tone control means being connected to the focus control means of the optical means so that the gain or the tone, i.e. dependency on frequency, of the amplifying means depends on the focusing adjustment of the optical means in such manner that the damping caused by a long listening distance in the sound or, in the case of tone controls, in the high-frequency sounds, is partially or totally compensated.

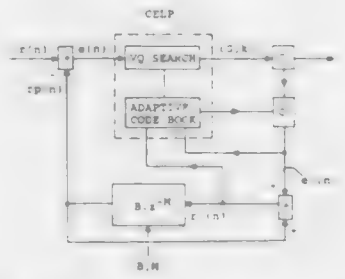
METHOD AND APPARATUS FOR DYNAMICALLY ADAPTING A VECTOR-QUANTIZING CODER CODEBOOK



Claude Galand; Jean Menez, both of Cagnes Sur Mer, and Michèle Rosso, Nice, all of France, assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Oct. 13, 1989, Ser. No. 420,966

Claims priority, application European Pat. Off., Oct. 19, 1988, 88480060.8

Int. Cl.[5] G10L *7/02*

U.S. Cl. 381—36 **7 Claims**

5. A Code Excited Linear Prediction/Long-Term Prediction (CELP/LTP) speech coding device including adaptive filtering means for filtering a speech signal s(n) and deriving therefrom a residual signal r(n); means for generating a predicted residual signal rp(n); means for subtracting said predicted residual signal from said residual signal and deriving therefrom an error residual signal e(n); vector quantizing means connected to said subtracting means, said vector quantizing means including a codebook initially loaded with predefined codewords, and search means for converting sequences of consecutive e(n) samples into a codeword address, said codeword being selected within said codebook for providing the lowest mean square error with respect to said sequence, and a gain factor; a codeword coder for encoding said selected codeword, a codeword decoder connected to said codeword coder for providing a decoded error signal e'(n); a long-term prediction (LTP) feedback loop connected to said codeword decoder for providing a decoded residual signal r'(n) and said rp(n) signal; said vector quantizing means being characterized in that it includes:

means for splitting said codebook codewords into a fixed content codebook portion and a fixed length adaptive contents codebook portion;

normalizing means connected to said codeword decoder and to said LTP feedback loop for generating normalized selected codewords CB(i) wherein:

$$CB(i) = \text{NORM}\ (a \cdot e'(i) + (1-a) \cdot r'(i))$$

wherein NORM stands for a normalization operation according to:

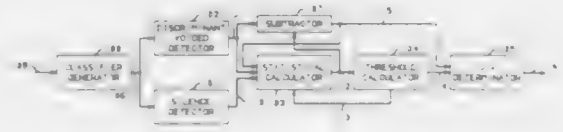
$$NORM\ (x(i)) = x(i)\ SQRT\left(\frac{j=L}{C/\ \text{SUM}\ x^2(j)}\right)$$
$$j=1$$

$$i = 1, 2, \ldots, L$$

wherein $a < 1$ represents a preselected weighting coefficient and SQRT represents the square root function, and C is a normalizing predefined fixed value.

loading means connected to said normalizing means for shifting said normalized selected codeword into said fixed length adaptive contents codebook portion, whereby a previously stored codeword therein is shifted out therefrom.

5,007,093



ADAPTIVE THRESHOLD VOICED DETECTOR

David L. Thomson, Warrenville, Ill., assignor to AT&T Bell Laboratories, Murray Hill, N.J.

Continuation of Ser. No. 34,298, Apr. 3, 1987, abandoned. This application Aug. 24, 1989, Ser. No. 399,357

Int. Cl.[5] G10L *9/18*

U.S. Cl. 381—46 **11 Claims**

1. An apparatus for detecting the presence of a fundamental frequency in frames of speech, comprising:

means responsive to a set of classifiers defining speech attributes of one of said frames of speech for generating a general value indicating said presence of said fundamental frequency;

means responsive to said general value for calculating a set of statistical parameters;

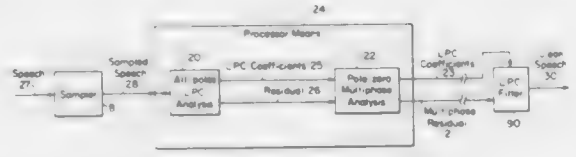
means for calculating a threshold value in response to said set of said parameters;

means for calculating a weight value in response to said set of said parameters;

means for communicating said weight value and said threshold value to said means for calculating said set of parameters to be used for calculating another set of parameters for another one of said frames of speech; and

means responsive to said weight value and said threshold value and the calculated set of statistical parameters for determining said presence of said fundamental frequency in said present one of said frames of speech.

5,007,094



MULTIPULSE EXCITED POLE-ZERO FILTERING APPROACH FOR NOISE REDUCTION

A-Chuan Hsueh, Laguna Niquel, Calif., and Chiu-Kuang Chuang, Lexington, Mass., assignors to GTE Products Corporation, Waltham, Mass.

Filed Apr. 7, 1989, Ser. No. 335,142

Int. Cl.[5] G10L *5/00*

U.S. Cl. 381—47 **31 Claims**

1. A method of encoding speech comprising;

estimating an excitation pulse train from an original speech signal;

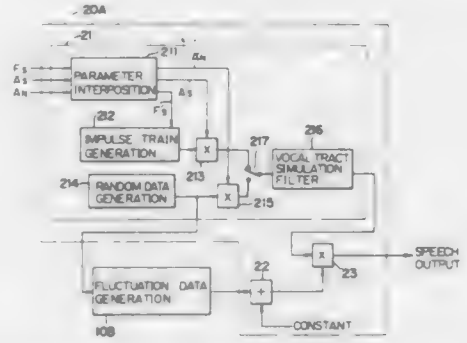
estimating a pole-zero filter;

applying the excitation pulse train to the estimated pole-zero filter to synthesize a speech signal; and

modifying coefficients of the pole-zone filter based on an error between the original speech signal and the synthesized speech signal.

5,007,095

SYSTEM FOR SYNTHESIZING SPEECH HAVING FLUCTUATION



Yasuhiro Nara, Chigasaki, and Tatsuro Matsumoto, Kawasaki, both of Japan, assignors to Fujitsu Limited, Kawasaki, Japan

Continuation of Ser. No. 170,255, Mar. 18, 1988, abandoned. This application Dec. 29, 1989, Ser. No. 462,295

Claims priority, application Japan, Mar. 18, 1987, 62-061149

Int. Cl.[5] G10L *5/00*

U.S. Cl. 381—51 **22 Claims**

1. A speech synthesizing system, comprising:

means for generating a vowel signal;

means for generating a consonant signal;

means for generating random data;

fluctuation data generating means, operatively connected to said random data generating means, for receiving random data from said means for generating random data, having a first-order delaying function for outputting fluctuation data, said fluctuation data generating means comprising:

first adding means having an input terminal and connected to said means for generating random data;

integral means, connected to said first adding means, for receiving an output from said first adding means and having an output terminal, said integral comprising:

multiplying means connected to said first adding means;

second adding means connected to said multiplying means and including an input terminal;

data holding means connected to said second adding means and having an input terminal; and

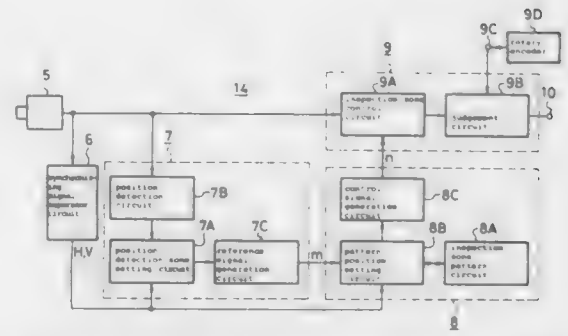
feedback line means provided between the output terminal of said data holding means and the input terminal of said second adding means, said multiplying means multiplying the output from said first adding means of said fluctuation data generating means and a factor of $1/\tau$, where τ is a time constant, and said second adding means in said integral means adding the output from said multiplying means and the output from said data holding means through said feedback line means;

negative feedback means, connected between the output terminal of said integral means and the input terminal of said first adding means, for multiplying the output from said integral means and a coefficient and inverting a signal of the multiplied value, said first adding means adding random data from said random data generating means and the inverted multiplied value from said negative feedback means;

selecting means, connected to receive a selection signal, for selecting one of the vowel signal or the consonant signal in response to the selection signal; and

means, operatively connected to said selecting means, for receiving an output signal from said selecting means and for filtering the received signal on the basis of a vocal tract simulation method, the fluctuation data from said fluctuation data generating means being substantially multiplied or added to one of the vowel signal or the consonant signal as determined by said selecting means.

5,007,096



OBJECT INSPECTION APPARATUS

Hajime Yoshida, Tokyo, Japan, assignor to Hajime Industries Ltd., Tokyo, Japan

Continuation of Ser. No. 239,017, Aug. 29, 1988, abandoned, which is a continuation of Ser. No. 15,942, Feb. 18, 1987, abandoned. This application Feb. 26, 1990, Ser. No. 484,483

Int. Cl.[5] G06K *9/00*

U.S. Cl. 382—8 **8 Claims**

1. An object inspection apparatus comprising:

(a) means for continuously transporting a plurality of objects to be inspected while simultaneously rotating the plurality of objects in such a manner that each one of said plurality of objects is transported through a predetermined visual field while rotated at least once in said predetermined visual field and that after one of said plurality of objects passes through said predetermined visual field, the next object enters said predetermined visual field;

(b) a light source for irradiating the object in said visual field;

(c) pick-up means for sensing said object within said visual field at different positions generating image signals of said object including a synchronizing signal;

(d) synchronizing signal separator means for separating the synchronizing signal from the image signal from said pick-up means;

(e) inspection means for receiving said image signals to inspect whether said object has a defect; said inspection means having:

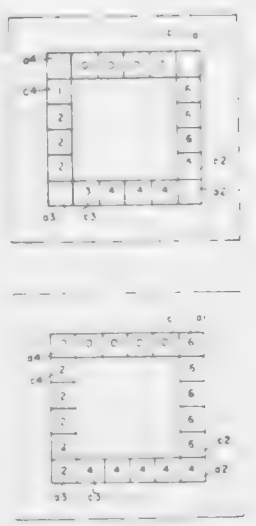
A. means for generating a reference position signal for said object at each of a plurality of different predetermined positions within said visual field, said reference position signal being derived from an image signal in a first field of said object at each of the different positions in combination with said synchronizing signal;

B. means for storing an inspection zone of predetermined shape common to said object at each of said different predetermined positions and for generating an inspection zone control signal derived from the reference position signal at each of said different predetermined positions in combination with the associated synchronizing signal;

said different predetermined positions and said inspection zones being so determined that the inspection zones do not overlap one another;

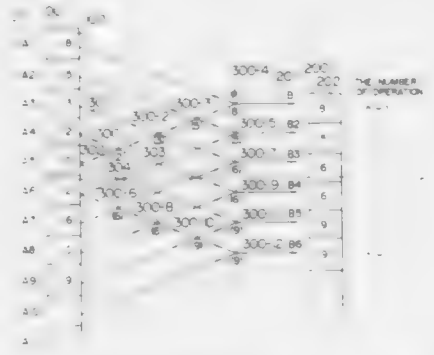
C. inspection zone control means for receiving the image signal from said pick-up means and the control signal and for delivering an image signal in a second field of each of said image signals at each of said different predetermined positions from said pick-up means within the inspection zone determined by said control signal;

D. means for receiving each of the image signals from each inspection zone control means and whether or not, said object has a defect at any of said different predetermined positions; and



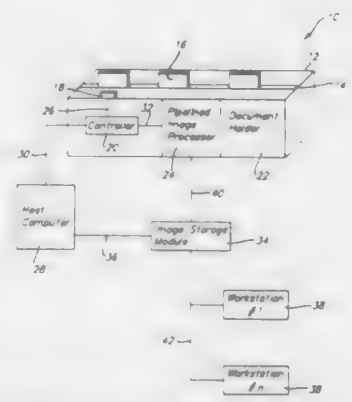
E. means for supplying an operation control signal to said judging means whereby said judging means is actuated.

5,007,097
LEAD'S POSITION RECOGNIZING DEVICE
Seiji Miznoka, Katano, and Kazumasa Okumura, Souraku, both of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Kadoma, Japan
Filed Jun. 29, 1990, Ser. No. 545,892
Int. Cl.[5] G06K 9/00
U.S. Cl. 382—8 2 Claims



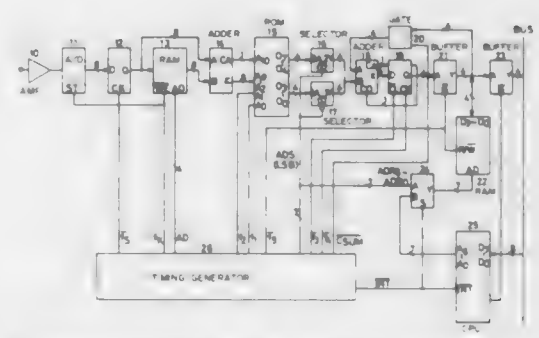
1. A lead's position recognizing device comprising:
a means for detecting outlines of regions surrounded by adjacent leads;
a means for detecting maximum points and minimum points of each outline; and
a means for detecting a position of said lead from intersecting point of a straight line connecting midpoints between maximum points and minimum points on each outline taken at a given proportion and said outline.

5,007,098
VECTORIZING METHOD
Ryohei Kumagai, Tokyo, Japan, assignor to Ezel, Inc., Tokyo, Japan
Filed Dec. 30, 1988, Ser. No. 292,309
Int. Cl.[5] G06K 9/48
U.S. Cl. 382—21 39 Claims



1. A vectorizing method comprising the steps of:
(a) generating an original train of codes, the values of said codes specifying boundary pixels of a configuration;
(b) identifying a pattern of code values in said original train, said pattern indicating a sequence of codes to be modified;
(c) generating a revised train of codes by modifying code values of said indicated sequence; and
(d) extracting vector points defining the borders of said configuration from said revised train of codes.

5,007,099
DATA FILTERING METHOD
Hitoshi Matsushima, Tachikawa, and Takafumi Miyatake, Hachioji, both of Japan, assignors to Hitachi, Ltd., Tokyo, Japan and Hitachi, Ltd., Tokyo, Japan
Filed Jun. 29, 1988, Ser. No. 213,133
Claims priority, application Japan, Jun. 29, 1987, 62-159594
Int. Cl.[5] G06K 9/00
U.S. Cl. 382—41 26 Claims



1. In a data processing system including sensing means for sensing an image and converting said image into input image data, preprocessing means connected to receive said input image data for filtering noise from said input image data, and data conversion means connected to receive said filtered input image data for converting said filtered input image data into output data, said preprocessing means including filter means for performing said noise filtering having n memory means for storing at least 2n pieces of data and operand interchangeable arithmetic means for performing a predetermined operation on said stored pieces of data, a data processing method of converting said input image data into said output data when said filter means is n-sized comprising the steps of:
sensing said image with said sensing means and converting said image into said input image data;
filtering noise from said input image data with said preprocessing means in order to produce first through (n+1)th filtered outputs of said preprocessing means;
converting said filtered input image data into said output data with said data conversion means;
said noise filtering step comprising the steps of:
(a) storing said input image data addresses of said memory means;
(b) inputting data stored in a first address of said memory means and data stored in a second address of said memory means to said arithmetic means and storing a result of an arithmetic operation performed on said data input from said first and second addresses in said first address;
(c) decrementing said first and second addresses by 1;
(d) repeating steps (b)–(c) n−2 times;
(e) inputting the first arithmetic operation result stored in said first memory and data stored in a third address of said memory means to said arithmetic means and outputting a result of an arithmetic operation performed on said first arithmetic operation result and said data input from said third address as said first filtered output of said preprocessing means;
(f) inputting the first arithmetic operation result stored in said first address and data stored in a fourth address of said memory means to said arithmetic means and outputting a result of an arithmetic operation performed on said first arithmetic operation result and said data input from said fourth address as said second filtered output of said preprocessing means;
(g) inputting said data stored in said fourth address and data stored in a fifth address of said memory means to said arithmetic means and storing a result of an arithmetic operation performed on said data input from said fourth and fifth addresses in said fourth address;
(h) inputting the arithmetic operation result stored in said fourth address and the last arithmetic operation result stored in said second address to said arithmetic means and outputting a result of an arithmetic operation performed on said arithmetic operation result input from said fourth address and the last arithmetic operation input from said second address as a filtered output of said preprocessing means;
(i) incrementing said second and fifth addresses by 1;
(j) repeating steps (g)–(i) n−2 times in order to provide the third through nth filtered outputs of said preprocessing means; and
(k) inputting the last arithmetic operation result stored in said fourth address and data stored in a sixth address of said memory means to said arithmetic means and outputting a result of an arithmetic operation performed on said last arithmetic operation result input from said fourth address and said data input from said sixth address as said (n+1)th filtered output of said preprocessing means.

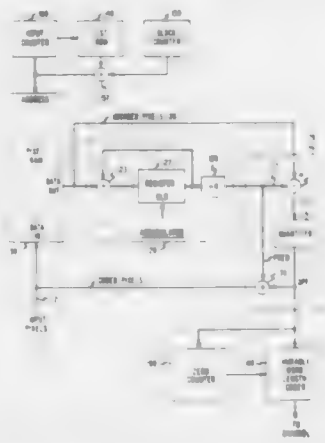
5,007,100
DIAGNOSTIC SYSTEM FOR A PARALLEL PIPELINED IMAGE PROCESSING SYSTEM
Robert D'Aoust, Detroit; Robert B. Cording, Livonia; Debora Y. Grosse, Ann Arbor; Kevin Jennings, Farmington Hills; Stephen R. Krebs, Ypsilanti Township, Washtenaw County; George E. Reasoner, Jr., Tecumseh; Gerald R. Smith, Farmington, and David C. Williams, Ann Arbor, all of Mich., assignors to Unisys Corporation, Bluebell, Pa.
Filed Oct. 10, 1989, Ser. No. 419,606
Int. Cl.[5] G06K 9/54
U.S. Cl. 382—49 14 Claims

1. In a pipelined image processor for generating and processing image data corresponding to the image of at least a first portion of a document, the pipelined image processor including at least one pipe comprising sequentially coupled image data resequencer, image data processor, and image data transposer/compressor assemblies, wherein said image data is processed by said image data resequencer, image data processor, and said image data transposer/compressor assemblies in a plurality of parallel channel, each channel corresponding to a segment of at least a first portion of the document, said pipelined image processor including diagnostic apparatus for determining correct operability of the pipelined image processor, said diagnostic apparatus comprising:
communication means, coupled to said image data resequencer, image data processor, and to said transporter/-compressor for transmitting data to said resequencer, image data processor, and to said transposer/compressor and for receiving data therefrom; and
controller means, coupled to said communication means, for receiving and storing said data received by said communication means and for monitoring such data.

5,007,101
AUTO-CORRELATION CIRCUIT FOR USE IN PATTERN RECOGNITION
Hiroyuki Iwahashi, Nara; Yoshiki Nishioka, Tenri, and Mitsuhiro Hakaridani, Nara, all of Japan, assignors to Sharp Kabushiki Kaisha, Japan
Filed Dec. 28, 1982, Ser. No. 454,022
Claims priority, application Japan, Dec. 29, 1981, 56-210296
Int. Cl.[5] G06K 9/36
U.S. Cl. 382—42 1 Claim

1. An auto-correlation unit for providing auto-correlation coefficients for use as feature parameters in pattern recognition for N pieces of sampled input values X_n (n=0 to N−1), said unit comprising:
means for extracting N pieces of sample input values X_n from a series of sample values in an input pattern expressed with an accuracy of optional multi-bits;
means for calculating the sum of the sample values X_n and $X_{n-\tau}$(τ=0–P, P≦N);
a read only memory associated with said means for calculating;
means for feeding to said read only memory the sum of the sampled input values as an address signal;
means for storing in said read only memory the squared value of each sum, $(X_n+X_{n-\tau})^2$;
means for fetching and outputting the squared values of each such sum of the sample input values from said read only memory when said memory is addressed by the sum of the sample input values; and
means responsive to the output $(X_n+X_{n-\tau})^2$ of said read only memory for providing an auto-correlation coefficient for use as a feature parameter according to the following formula:

$$\sum_{n=0}^{N-1}[X_n + X_{n-\tau}]^2/2 \cdot \sum_{n=0}^{N-1} X_n^2 \quad 1$$



5,007,102
DATA COMPRESSION USING BLOCK LIST TRANSFORM
Barry G. Haskell, Tinton Falls, N.J., assignor to AT&T Bell Laboratories, Murray Hill, N.J.
Continuation of Ser. No. 841,571, Mar. 20, 1986, abandoned.
This application May 3, 1989, Ser. No. 351,334
Int. Cl.[5] G06K 9/36
U.S. Cl. 382—56 25 Claims

1. A method for predictively encoding scanned data signals divided into two-dimensional blocks containing a plurality of data point signals, comprising the steps of:
selecting a data point signal to be encoded in a sequence predetermined by a given ordered list where some adja-

cent data points in said list are from different, non-adjacent, lines of a block;

obtaining a set of prediction data point signals for the selected data point from among encoded data point signals and forming a neighborhood that is substantially centered in the two dimensions about the corresponding data point signals to be encoded;

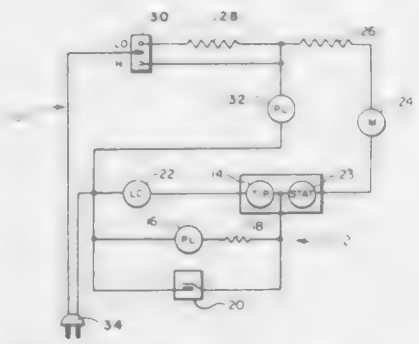
developing a predicted value for said selected data point

signal in accordance with said set of prediction data point signals;

developing a quantized prediction error signal from a quantized arithmetic difference between said data point signal to be encoded and said predicted value; and

developing an encoded data point signal based on said predicted value of said selected data point signal and on said quantized prediction error signal, to add thereby to said encoded data point signals.

5,007,103



AUTOMATIC SHUT-OFF AND ALARM FOR ELECTRIC HEATER

Paul C. Tyrrell, Kansas City; Johannes B. Backes, Raytown, both of Mo.; David D. McCormick, Shawnee Mission, Kans., and John F. Jesse, Buckner, Mo., assignors to Rival Manufacturing Company, Kansas City, Mo.

Filed Oct. 21, 1988, Ser. No. 260,881

Int. Cl.[5] H05B *1/02*

U.S. Cl. 219—363 **27 Claims**

1. An electric heater assembly comprising:

at least one electrical heating element;

an electrically actuated alarm for providing an alarm warning upon actuation;

a tip-over switch having a closed position in which a short circuit is provided therethrough when said heater is in a predetermined level position and having an open position in which an open circuit is provided therethrough when said heater is tilted beyond predetermined tilt angle; and

circuit means for electrically connecting said heating element, said tip-over switch and said alarm such that said tip-over switch disables said heating element and actuates said alarm when said tip-over switch is in one of said open and closed positions and such that said tip-over switch enables said heating element and disables said alarm when said tip-over switch is in the other of said open and closed positions.

5,007,104

SPEAKER SWITCHING DEVICE

Ernest A. Brochu, 288 Margaret Henry Rd., S. Killingly, Conn. 06106

Filed Apr. 24, 1989, Ser. No. 342,020

Int. Cl.[5] H04B *1/20*

U.S. Cl. 455—74 **1 Claim**

1. A speaker switching device for a radio having a radio power supply and producing a radio speaker output and a tape deck having a tape deck power supply and producing a tape deck speaker output when a tape cartridge is inserted therein, said speaker switching device comprising

a single pair of speakers;

relay contact means;

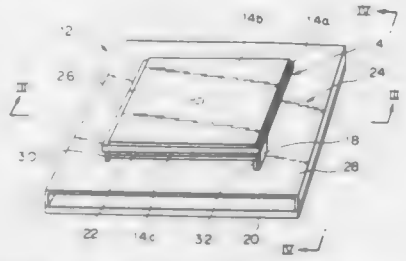
circuit means electrically connecting the speakers to the radio speaker output and to the tape deck speaker output through the relay contact means in a manner whereby in a first position of the contact means the radio speaker output is electrically connected to the speakers and the tape deck speaker output is disconnected from the speaker and in a second position of said contact means the tape deck speaker output is electrically connected to the speakers and the radio speaker output is disconnected from the speakers;

relay energizing winding means for controlling the positioning of the relay contact means; and

current-sensitive transistor switch means electrically connecting the relay energizing winding means to the tape deck power supply when the tape deck power supply is activated by inserting a cartridge, said radio power supply inherently drawing a lower current than said tape deck power supply during normal operation, and said current-sensitive transistor switch means being ineffective to so energize said relay winding means unless said tape deck power supply is producing sufficient current to operate said tape deck as a result of inserting a cartridge therein

5,007,105

WATCH TYPE PAGING RECEIVER



Kazuhiro Kudoh, Tokyo; Toshirou Nishiyama, and Sadayuki Anma, both of Shizuoka, all of Japan, assignors to NEC Corporation, Tokyo, Japan

Continuation of Ser. No. 232,196, Aug. 15, 1988, abandoned. This application Sep. 4, 1990, Ser. No. 577,847

Claims priority, application Japan, Aug. 14, 1987, 62-201746; Aug. 21, 1987, 62-206380; Sep. 16, 1987, 62-229602; Sep. 16, 1987, 62-229603

Int. Cl.[5] H04B *1/06, 1/18*

U.S. Cl. 455—344 **25 Claims**

1. A portable radio communication apparatus comprising:

a body accommodating a receiving circuit of said apparatus;

display means with an optical reflector provided on said body for displaying information received by said receiving circuit; and

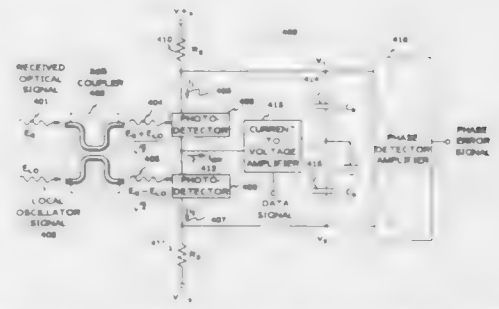
a main antenna including said optical reflector connected to said receiving circuit constituted by a part of structural members of said display means.

5,007,106

OPTICAL HOMODYNE RECEIVER

Joseph M. Kahn, Red Bank, N.J., and Bryon L. Kasper, Allentown, Pa., assignors to AT&T Bell Laboratories, Murray Hill, N.J.

Filed Nov. 8, 1989, Ser. No. 433,632



Int. Cl.[5] H04B *10/06*

U.S. Cl. 455—619 **16 Claims**

1. An optical homodyne receiver comprising:

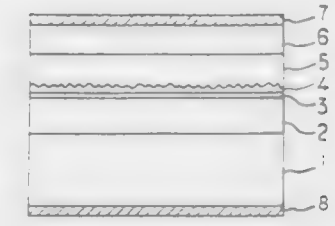
first and second photodetectors responsive to first and second optical signals, respectively, said first photodetector connected between first and second terminals, said second photodetector connected between a third terminal and said second terminal, said first optical signal comprising the electrical-field sum of a local oscillator signal and a received optical signal, and said second optical signal comprising the electrical-field difference between said local oscillator signal and said received optical signal;

means, for detecting a data component of said received optical signal, electrically connected to said second terminal; and

means, for detecting the relative phase difference between said received optical signal and said local oscillator signal, electrically connected across said first and third terminals.

5,007,107

SEMICONDUCTOR LASER DEVICE



Haruhisa Takiguchi, Nara; Hiroaki Kudo, Tenri; Chitose Sakane, and Satoshi Sugahara, both of Nara, all of Japan, assignors to Sharp Kabushiki Kaisha, Osaka, Japan

Filed Nov. 6, 1989, Ser. No. 432,063

Claims priority, application Japan, Nov. 8, 1988, 63-282999

Int. Cl.[5] H01S *3/19*

U.S. Cl. 372—96 **5 Claims**

1. In a semiconductor laser device comprising an active layer positioned between a first cladding layer and a second cladding layer, said active layer being made of, a compound semiconductor material selected from the group consisting of $(Al_xGa_{1-x})_{0.5}In_{0.5}P$ $(0 \leqq x \leqq 0.7)$, $Al_xGa_{1-x}As$ $(0 \leqq x \leqq 0.4)$, and $Ga_xIn_{1-x}P_{1-y}As_y$ $(0.5 \leqq x \leqq 1,\ 0 \leqq y \leqq 1,$ and $y = 2x - 1)$, wherein an optical guiding layer having a diffraction grating made of $(Al_xGa_{1-x})_{0.5}In_{0.5}P$ $(0 \leqq x \leqq 1)$ is positioned between said active layer and one of said cladding layers.

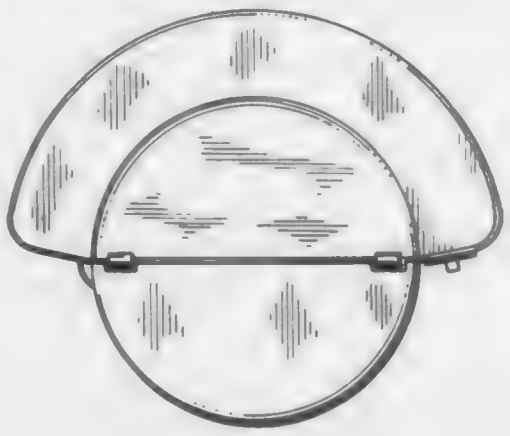
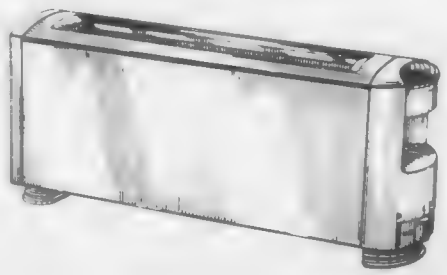
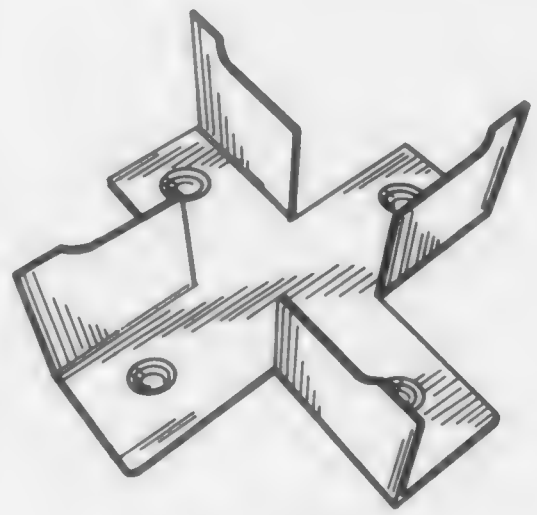
WATER COOLER CABINET
Dennis Clevenger, 5091 Harcum St., Irving, Calif. 92715
Filed Dec. 4, 1986, Ser. No. 938,135
Term of patent 14 years
U.S. Cl. D7—306



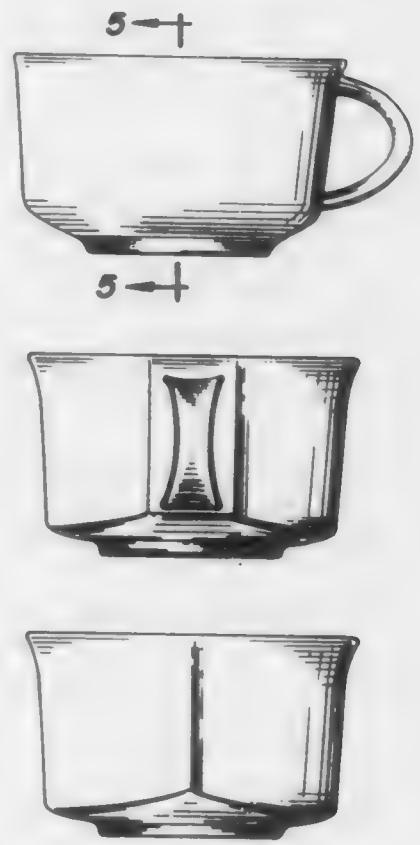
316,004
COFFEE MACHINE
Arthur Eugster, Romanshorn, Switzerland, assignor to Arthur Eugster AG, Romanshorn, Switzerland
Filed Aug. 6, 1987, Ser. No. 83,059
Claims priority, application Fed. Rep. of Germany, Feb. 6, 1987, URA150/87
Term of patent 14 years
U.S. Cl. D7—309



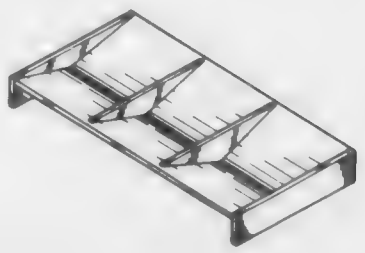
316,005
JUICE DISPENSER
George L. Thompson, Snellville; Kenneth G. Smazik; Jonathan Kirschner, both of Marietta; William S. Credle, Jr., Stone Mountain, and Rickey D. Burns, Atlanta, all of Ga., assignors to The Coca-Cola Company, Atlanta, Ga.
Continuation-in-part of Ser. No. 924,532, Oct. 29, 1986, Pat. No. Des. 309,395. This application Feb. 24, 1988, Ser. No. 160,567
Term of patent 14 years
U.S. Cl. D7—311



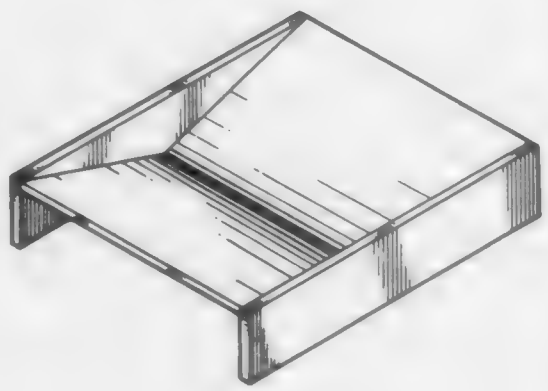
316,006
TOASTER
Lutz Gebhardt, Darmstadt, Fed. Rep. of Germany, assignor to Rowenta-Werke GmbH, Offenbach am Main, Fed. Rep. of Germany
Filed May 3, 1988, Ser. No. 189,741
Claims priority, application Fed. Rep. of Germany, Nov. 4, 1987, 5MR10799
Term of patent 14 years
U.S. Cl. D7—330



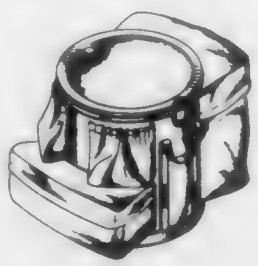
316,007
COOKING SUPPORT STAND FOR A FONDUE POT OR SIMILAR ARTICLE
Hans R. Wagner, 25 Woodale La., Santa Barbara, Calif. 93103
Filed Jan. 14, 1988, Ser. No. 143,700
Term of patent 14 years
U.S. Cl. D7—366



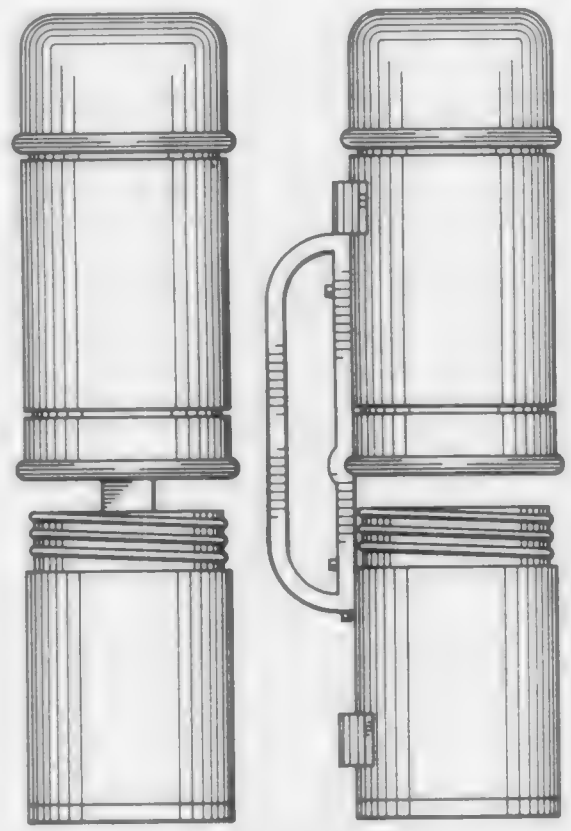
316,008
FIRE STARTER
Oak D. Norton, 1857 Park Forest Ave., State College, Pa. 16801
Filed Jun. 7, 1990, Ser. No. 534,439
Term of patent 14 years
U.S. Cl. D7—416



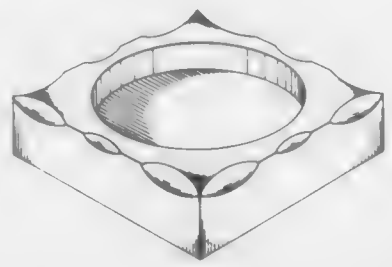
316,009
CUP OR SIMILAR ARTICLE
Ludwig Scherer, Luxembourg, Luxembourg, assignor to Villeroy & Boch S.A.R.L., Luxembourg, Luxembourg
Division of Ser. No. 146,804, Jan. 22, 1988. This application Apr. 19, 1990, Ser. No. 511,387
Term of patent 14 years
U.S. Cl. D7—536



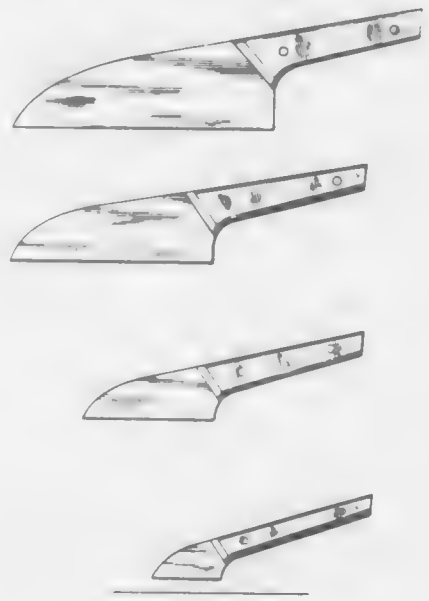
316,010
COMPARTMENTED SERVING TRAY
David W. Guy, 1008 S. First St., Pinckneyville, Ill. 62274
Filed Feb. 16, 1989, Ser. No. 311,582
Term of patent 14 years
U.S. Cl. D7—554



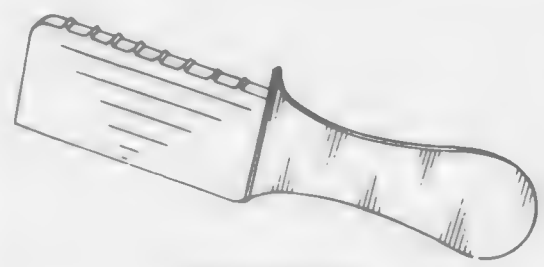
316,011
FOOD DISH
David W. Guy, 1008 S. First St., Pinckneyville, Ill. 62274
Filed Feb. 16, 1989, Ser. No. 311,581
Term of patent 14 years
U.S. Cl. D7—586



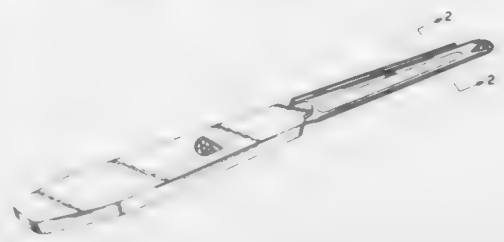
316,012
ICE CHEST
Gary Christopher, 5211 La Jolla Blvd., La Jolla, Calif. 92037
Filed Feb. 17, 1989, Ser. No. 311,894
Term of patent 14 years
U.S. Cl. D7—605



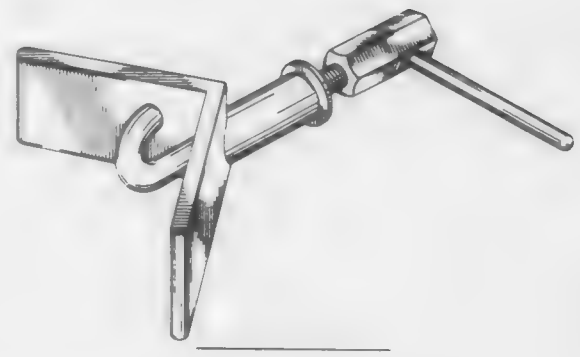
316,013
DUAL INSULATED BOTTLE
Wiley Jones, P.O. Box 1721 Brazoria, TX 77422
Filed Jun. 21, 1989, Ser. No. 369,669
Term of patent 14 years
U.S. Cl. D7—608



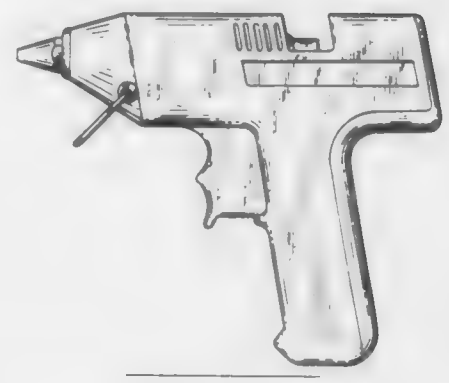
316,014
DECORATIVE DRINK COASTER
Norman R. Pinette, Jr., 159 Forest Ave., Seekonk, Mass. 02771
Filed Jul. 8, 1988, Ser. No. 216,451
Term of patent 14 years
U.S. Cl. D7—624



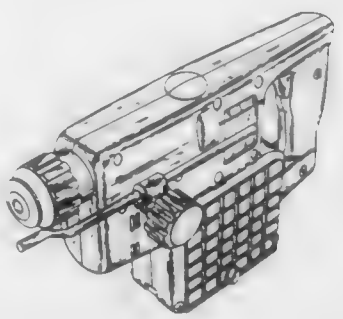
316,015
KNIFE
Joseph M. DiGangi, 5565 W. Walnut Cir., Espanola, N. Mex. 87532
Filed Aug. 20, 1987, Ser. No. 87,651
Term of patent 14 years
U.S. Cl. D7—649



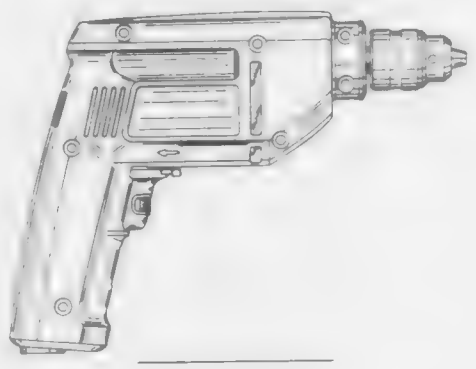
316,016
BUTTER KNIFE
A. George Nix, 8420 Fanita Dr. #36, Santee, Calif. 92071
Filed May 2, 1989, Ser. No. 346,757
Term of patent 14 years
U.S. Cl. D7—673



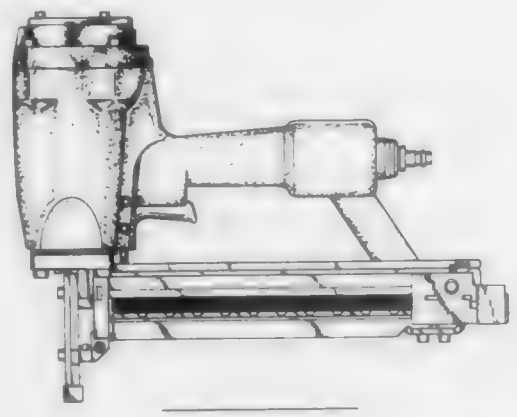
316,017
FRUIT PEELING UTENSIL
Chun T. Chung, 163-192, Youngchun-Dong, Seodaemoon-ku, Seoul, Rep. of Korea
Filed Oct. 19, 1988, Ser. No. 260,353
Claims priority, application Rep. of Korea, May 12, 1988, 6492/1988[U]
Term of patent 14 years
U.S. Cl. D7—695



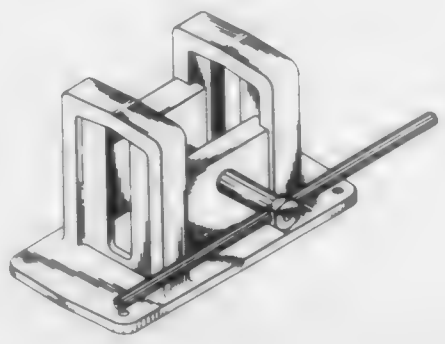
316,018
BENDING TOOL FOR SQUARING CORNERS OF WIRE FRAMES
John Penner, P.O. Box 25764, and Robert E. Nigh, P.O. Box 26202, both of Prescott Valley, Ariz. 86312
Filed Dec. 7, 1987, Ser. No. 129,672
Term of patent 14 years
U.S. Cl. D8—14



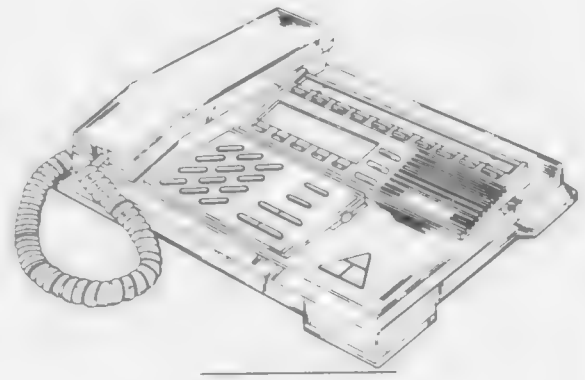
316,019
TRIGGER FEED GLUE GUN
Richard A. Belanger, Kensington, N.H., assignor to Adhesive Technologies, Inc., Hampton, N.H.
Filed Feb. 29, 1988, Ser. No. 162,364
Term of patent 14 years
U.S. Cl. D8—30



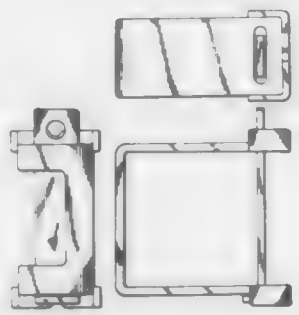
316,020
PORTABLE ELECTRIC HAMMER DRILL
Fusao Fushiya; Takashi Yamazaki, and Mikio Saito, all of Anjo, Japan, assignors to Makita Electric Works, Ltd., Japan
Filed May 12, 1988, Ser. No. 192,897
Claims priority, application Japan, Dec. 22, 1987, 62-52251
Term of patent 14 years
U.S. Cl. D8—61



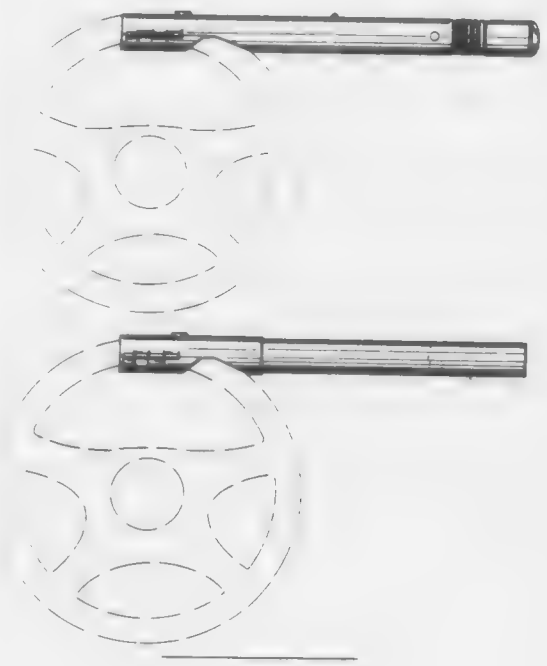
316,021
DRILL
Roderick F. Bunyea, Westminster, Md., assignor to Black & Decker Inc., Newark, Del.
Filed Mar. 11, 1988, Ser. No. 166,676
Term of patent 14 years
U.S. Cl. D8—68



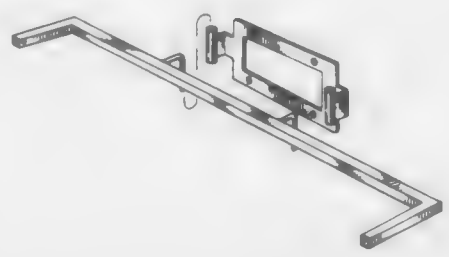
316,022
PNEUMATIC STAPLER
Roland Moraht, Krempenhege 15, 2000 Hamburg 65, Fed. Rep. of Germany
Filed Nov. 17, 1987, Ser. No. 121,740
Term of patent 14 years
U.S. Cl. D8—69



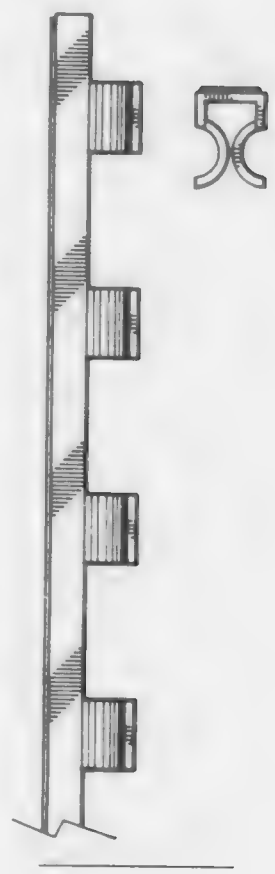
316,023
CHAIN SAW BAR STRAIGHTENER
Samuel A. Librande, 150 Vicki Ave., Hayden Lake, Id. 83835
Filed Jan. 15, 1988, Ser. No. 144,865
Term of patent 14 years
U.S. Cl. D8—71



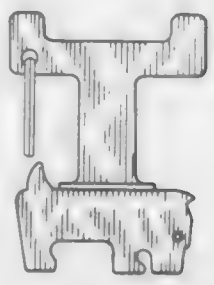
316,024
ALL DIGITAL TELEPHONE ANSWERING DEVICE
David A. Sharbaugh, Irvine, Calif., assignor to PhoneMate, Inc., Torrance, Calif.
Filed Dec. 26, 1989, Ser. No. 456,266
Term of patent 14 years
U.S. Cl. D14—141



316,025
STEERING COLUMN LOCK
Hugh J. Webster, 32565 Jefferson Dr., Solon, Ohio 44139
Filed Aug. 16, 1989, Ser. No. 394,857
Term of patent 14 years
U.S. Cl. D8—331



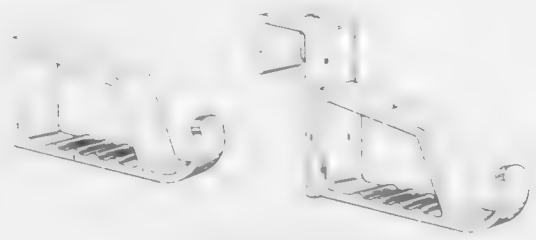
316,026
ANTI-THEFT VEHICLE STEERING WHEEL LOCK
Kip L. Fuller, Littleton, Colo., assignor to Innovision Technologies Group, Inc., Denver, Colo.
Filed Apr. 16, 1990, Ser. No. 509,495
Term of patent 14 years
U.S. Cl. D8—331



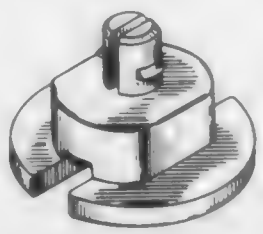
316,027
MOUNTING FOR A RETRACTABLE VEHICLE COVER
David L. Geeting, 1690 El Dorado Dr., Thousand Oaks, Calif. 91360, and Jeffrey P. Main, 3955 N. Ceanothus Pl., Unit J, Calabasas, Calif. 91302
Filed Dec. 20, 1988, Ser. No. 286,774
Term of patent 14 years
U.S. Cl. D8—349

316,028
SHOWER CURTAIN RETAINER
Ronald A. Wallace, 35 Clover St., Stratford, Conn. 06497
Filed Jul. 21, 1988, Ser. No. 222,234
Term of patent 14 years
U.S. Cl. D8—354

316,029
COMBINED FUEL PUMP DISPENSING HANDLE LEVER HOLDER AND KEY RING
Gary Taramaschi, 2501 Pico Blvd., Apt. 303, Santa Monica, Calif. 90405
Filed Dec. 26, 1989, Ser. No. 456,283
Term of patent 14 years
U.S. Cl. D8—354



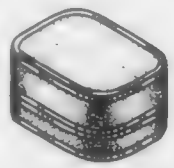
316,030
CORD WINDER FOR EAR PHONES
Michael Adielsson, Västerås, Sweden, assignor to Handeldesign V.B., Västerås, Sweden
Filed Nov. 2, 1988, Ser. No. 265,476
Claims priority, application Sweden, May 3, 1988, 88-1142
Term of patent 14 years
U.S. Cl. D8—358



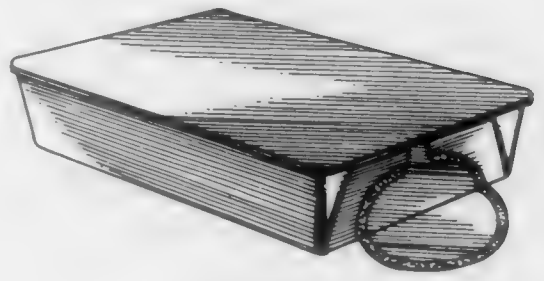
316,031
HANGER HOLDER
Sheldon H. Goodman, 4079 Princeton Blvd., South Euclid, Ohio 44121, and Steven E. Greenhut, 21545 Club Villa Ter., Boca Raton, Fla. 33433
Filed Dec. 2, 1988, Ser. No. 279,130
Term of patent 14 years
U.S. Cl. D8—363

316,032
GLIDE PAD FOR SLIDING WINDOWS, DOORS AND THE LIKE
Dennis Westphal, Galva, and Jonathan Piles, McPherson, both of Kans., assignors to CertainTeed Corporation, Valley Forge, Pa.
Filed Jul. 29, 1988, Ser. No. 226,397
Term of patent 14 years
U.S. Cl. D8—400

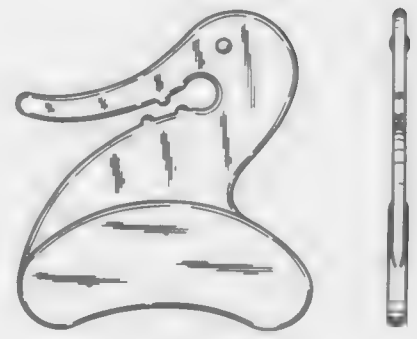
316,033
DISPENSER FOR PASTY PRODUCTS
Manuel Czech, Donaustauf, Fed. Rep. of Germany, assignor to Joachim Czech, Donaustauf, Fed. Rep. of Germany
Filed Jan. 27, 1989, Ser. No. 302,830
Claims priority, application Fed. Rep. of Germany, Aug. 1, 1988, M8800744.8
Term of patent 14 years
U.S. Cl. D9—300



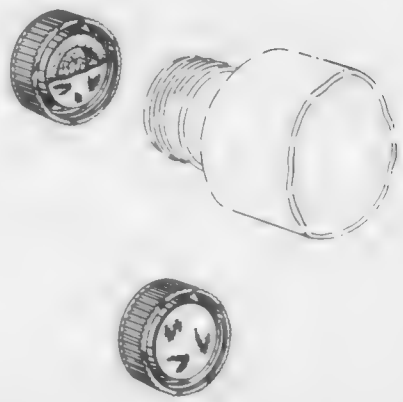
316,034
NAIL POLISH BOTTLE
Arthur DeGaetano, Stamford, Conn., assignor to Revlon, Inc., New York, N.Y.
Continuation of Ser. No. 882,808, Jul. 7, 1986, abandoned. This application Oct. 25, 1989, Ser. No. 427,929
Term of patent 14 years
U.S. Cl. D9—338



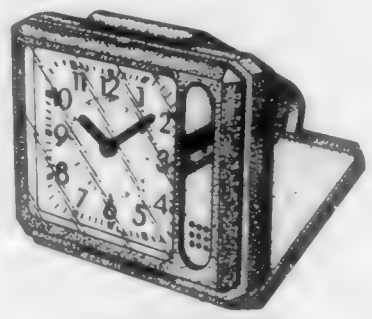
316,035
DOUBLE SECTIONED CONTAINER WITH DOUBLE POUR SPOUT
Natal Pepitone, 97-23 84th St., Ozone Park, N.Y. 11416
Filed Apr. 28, 1988, Ser. No. 187,394
Term of patent 14 years
U.S. Cl. D9—347



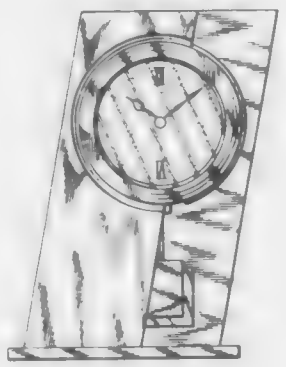
316,036
JEWELRY BOX
Myril Kaplan, 125 E. 144th St., Bronx, N.Y. 10451
Filed Apr. 3, 1986, Ser. No. 847,821
The portion of the term of this patent subsequent to Apr. 3, 2004, has been disclaimed.
Term of patent 14 years
U.S. Cl. D9—423



316,037
FOOD PACKAGE
John E. Kea, New Castle, Del., assignor to Westvaco Corporation, New York, N.Y.
Filed Jan. 10, 1989, Ser. No. 295,281
Term of patent 14 years
U.S. Cl. D9—425

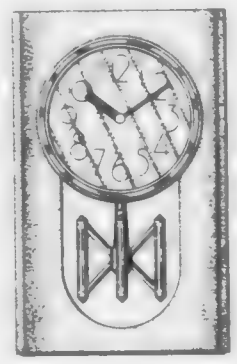


316,038
SLIP CLIP FOR CLOSING BAGS
Roland J. Gagnet, P.O. Box 6149, Toledo, Ohio 43614
Filed Sep. 6, 1988, Ser. No. 241,129
Term of patent 14 years
U.S. Cl. D9—434

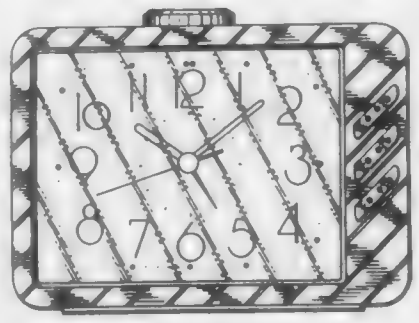


316,039
COMBINED CLOSURE AND CONTAINER FOR A DRYING AGENT
Donald J. Sykes, Upper Saddle River, N.J., and Gary E. Gendron, Boiceville, N.Y., assignors to Marpac Industries, Inc., Waldwick, N.J.
Continuation-in-part of Ser. No. 735,084, May 17, 1985, abandoned. This application Aug. 1, 1988, Ser. No. 226,984
Term of patent 14 years
U.S. Cl. D9—436

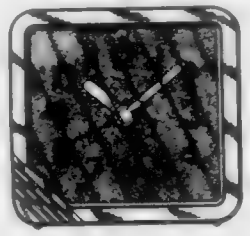
316,040
TRAVEL ALARM CLOCK
Keiko Mayuzumi, Tokyo, Japan, assignor to Seikosha Co., Ltd., Japan
Filed Feb. 9, 1988, Ser. No. 154,998
Claims priority, application Japan, Aug. 31, 1987, 62-35465
Term of patent 14 years
U.S. Cl. D10—18



316,041
CLOCK
Keiko Mayuzumi, and Masumi Mukoyama, both of Tokyo, Japan, assignors to Seikosha Co., Ltd., Japan
Filed Apr. 11, 1988, Ser. No. 180,011
Claims priority, application Japan, Nov. 2, 1987, 62-44883
Term of patent 14 years
U.S. Cl. D10—21



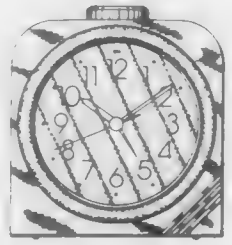
316,042
CLOCK
Asao Takashima, and Kunihiko Ito, both of Tokyo, Japan, assignors to Seikosha Co., Ltd., Japan
Filed Feb. 9, 1988, Ser. No. 154,994
Claims priority, application Japan, Aug. 13, 1987, 62-33135
Term of patent 14 years
U.S. Cl. D10—23



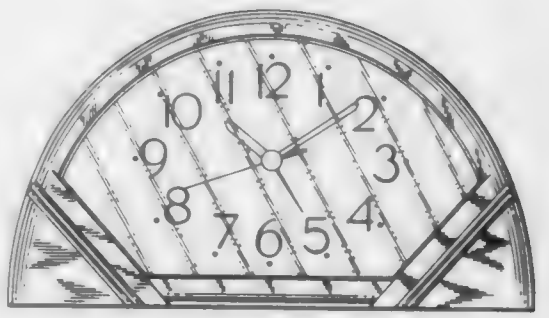
316,043
CLOCK
Asao Takashima, Tokyo, Japan, assignor to Seikosha Co., Ltd., Japan
Filed Jan. 25, 1988, Ser. No. 147,774
Claims priority, application Japan, Aug. 4, 1987, 62-31703
Term of patent 14 years
U.S. Cl. D10—25

316,044
CLOCK
Masahiro Aikawa, Tokyo, Japan, assignor to Seikosha Co., Ltd., Japan
Filed Feb. 12, 1988, Ser. No. 155,627
Claims priority, application Japan, Sep. 3, 1987, 62-36032
Term of patent 14 years
U.S. Cl. D10—25

316,045
CLOCK
Seiji Odaka, Tokyo, Japan, assignor to Seikosha Co., Ltd., Japan
Filed Feb. 12, 1988, Ser. No. 155,628
Claims priority, application Japan, Sep. 3, 1987, 62-36033
Term of patent 14 years
U.S. Cl. D10—25

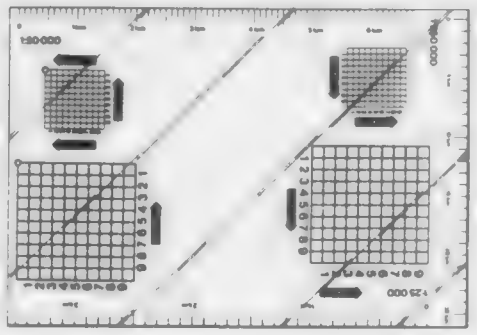


316,046
CLOCK
Kayoko Kato, Tokyo, Japan, assignor to Seikosha Co., Ltd., Japan
Filed Feb. 12, 1988, Ser. No. 155,630
Claims priority, application Japan, Sep. 3, 1987, 62-36035
Term of patent 14 years
U.S. Cl. D10—25



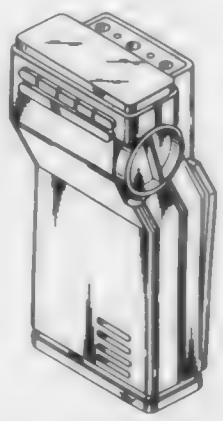
316,047
CLOCK
Tokiko Imai, Tokyo, Japan, assignor to Seikosha Co., Ltd., Japan
Filed Jan. 25, 1988, Ser. No. 147,772
Claims priority, application Japan, Aug. 13, 1987, 62-33139
Term of patent 14 years
U.S. Cl. D10—28

316,048
CLOCK
Masahiro Aikawa, Tokyo, Japan, assignor to Seikosha Co., Ltd., Japan
Filed Feb. 9, 1988, Ser. No. 154,997
Claims priority, application Japan, Aug. 31, 1987, 62-35463
Term of patent 14 years
U.S. Cl. D10—28

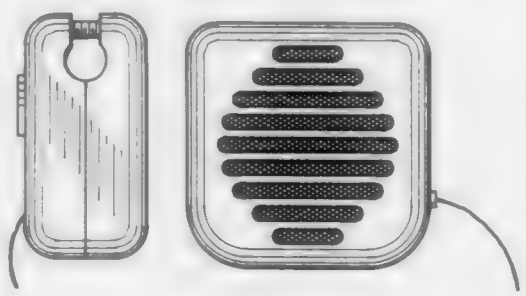


316,049
CLOCK
Kayoko Kato, Tokyo, Japan, assignor to Seikosha Co., Ltd., Japan
Filed Feb. 12, 1988, Ser. No. 155,629
Claims priority, application Japan, Sep. 3, 1987, 62-36029
Term of patent 14 years
U.S. Cl. D10—28

316,050
WRISTWATCH AND BRACELET
Raymond L. Weil, Cologny, Switzerland, assignor to Raymond Weil S.A., Genève, Switzerland
Filed Sep. 10, 1987, Ser. No. 95,511
Claims priority, application Hague, Mar. 13, 1987, DMA/000597
Term of patent 14 years
U.S. Cl. D10—32



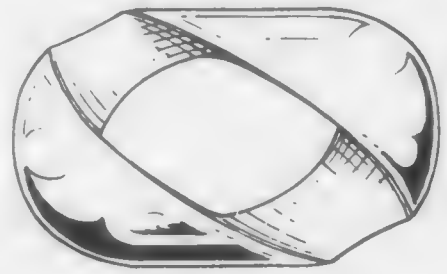
316,051
DRAFTING RULER
Svein E. Strande, Brugaten 4, Jevnaker, Norway (3520)
Filed Dec. 18, 1987, Ser. No. 135,402
Claims priority, application Norway, Jun. 18, 1987, 68376
Term of patent 14 years
U.S. Cl. D10—71



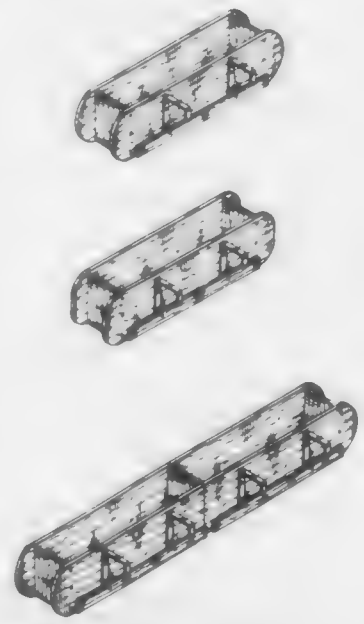
316,052
ELECTRICAL CURRENT INDICATING DEVICE
James E. Bubash, 252 Sunset Dr., Ballwin, Mo. 63011
Filed Oct. 26, 1987, Ser. No. 113,808
Term of patent 14 years
U.S. Cl. D10—78

316,053
MULTIMETER
Milton B. Hollander; William E. McKinley, and George R. Rounds, all of Stamford, Conn., assignors to Omega Engineering, Inc., Stamford, Conn.
Filed Oct. 20, 1988, Ser. No. 260,356
Term of patent 14 years
U.S. Cl. D10—78

316,054
SIGNAL MONITOR FOR AN AUTOMOTIVE TURN SIGNAL OPERATION
Leo F. Jammaron, 4915 State Hwy. 82, Glenwood Springs, Colo. 81601
Filed Oct. 31, 1988, Ser. No. 264,502
Term of patent 14 years
U.S. Cl. D10—104

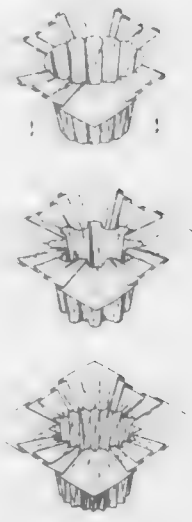


316,055
ELECTRONIC BICYCLE BELL
Edgar Rixen, Solingen, Fed. Rep. of Germany, assignor to Rixen & Karl GmbH, Solingen, Fed. Rep. of Germany
Filed Mar. 20, 1989, Ser. No. 325,478
Term of patent 14 years
U.S. Cl. D10—116



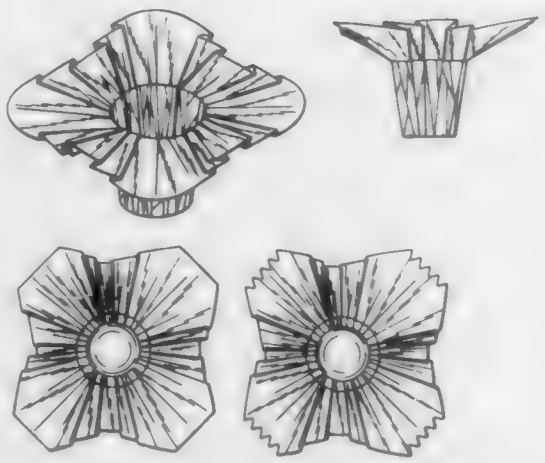
316,056
BRACELET
Daniel Lauper, Giviziez, Switzerland, assignor to Interdica S.A., Villar-sur-Glane, Switzerland
Filed Feb. 4, 1988, Ser. No. 152,053
Claims priority, application France, Aug. 7, 1987, 87 4706
The portion of the term of this patent subsequent to Feb. 19, 2005, has been disclaimed.
Term of patent 14 years
U.S. Cl. D11—12

316,057
LINK ELEMENT
Paolo Bulgari, Rome, Italy, assignor to Partecipazioni Bulgari S.p.A., Rome, Italy
Division of Ser. No. 132,118, Dec. 14, 1987, Pat. No. Des. 310,978. This application Jun. 1, 1990, Ser. No. 531,534
Claims priority, application Italy, Jun. 22, 1987, 35871/87[U]
Term of patent 14 years
U.S. Cl. D11—93

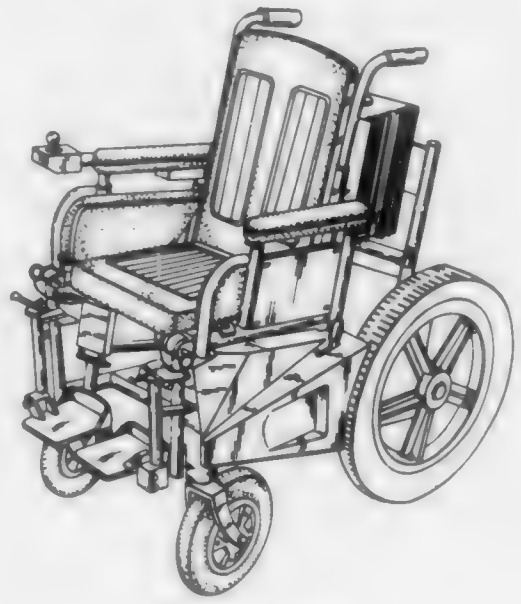


316,058
RAIL-MOUNTABLE PLANTER
Deryl K. Mitchell, and Jeannine C. Mitchell, both of 3857 25th Ave. W., Seattle, Wash. 98199
Filed Dec. 21, 1988, Ser. No. 288,536
Term of patent 14 years
U.S. Cl. D11—156

316,059
LAWN SCULPTURE
Martha L. Wieman, Livingston, Tex., and Mark Wieman, 272 Yaupon Cove, Livingston, Tex. 77351
Filed Jan. 4, 1989, Ser. No. 293,484
Term of patent 14 years
U.S. Cl. D11—158

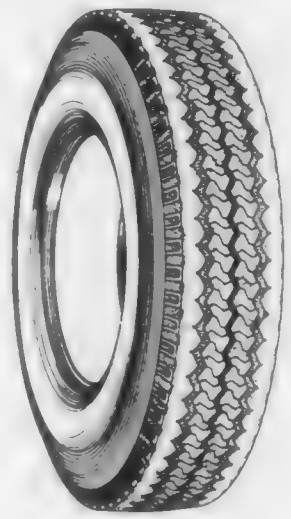


316,060
FLOWER POT COVER
Donald E. Weder; Erwin H. Weder; Wanda M. Weder, all of Highland, Calif.; Franklin J. Craig, Valley Park, Mo.; Wilma M. Donnelly, Highland, Ill.; Phyllis J. Bolk, Highland, Ill.; John W. Bergstrand, Highland, Ill., and Robert C. Abrams, Edwardsville, Ill., assignors to Highland Supply Corporation, Highland, Ill.
Continuation-in-part of Ser. No. 613,053, May 22, 1984, Pat. No. D. 293,224. This application Oct. 13, 1987, Ser. No. 108,307
Term of patent 14 years
U.S. Cl. D11—164

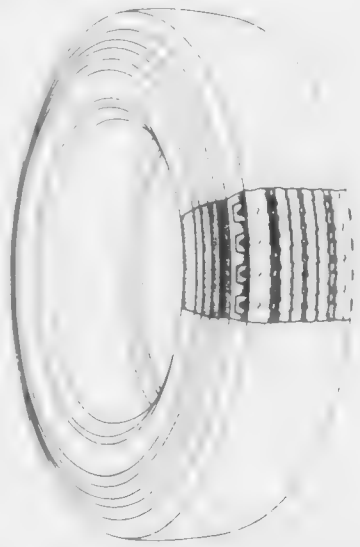


316,061
FLOWER POT COVER
Donald E. Weder, Highland, Ill., assignor to Highland Supply Corporation, Highland, Ill.
Filed Mar. 9, 1989, Ser. No. 321,464
The portion of the term of this patent subsequent to Apr. 2, 2005, has been disclaimed.
Term of patent 14 years
U.S. Cl. D11—164

316,062
FLOWER POT COVER
Donald E. Weder, Highland, Ill.; Wanda M. Weder, Highland, and Janet M. Weder, Redlands, both of Calif., assignors to Highland Supply Corporation, Highland, Ill.
Filed Jun. 2, 1989, Ser. No. 360,733
The portion of the term of this patent subsequent to Apr. 2, 2005, has been disclaimed.
Term of patent 14 years
U.S. Cl. D11—164

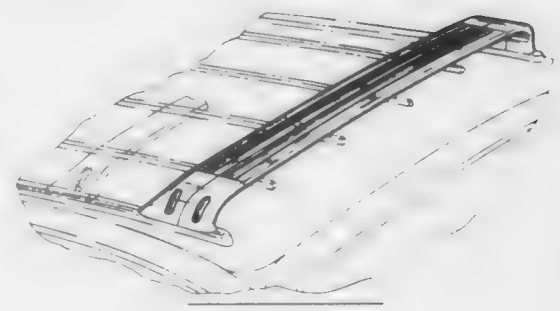


316,063
POWER DRIVE WHEELCHAIR
James J. Michel, Agoura, Calif., assignor to Everest & Jennings, Inc., Camarillo, Calif.
Filed Oct. 7, 1988, Ser. No. 254,796
Term of patent 14 years
U.S. Cl. D12—131

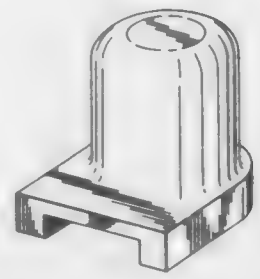


316,064
TIRE TREAD
Georges Adam, Bissen, and Claude Lardo, Luxembourg, both of Luxembourg, assignors to The Goodyear Tire & Rubber Company, Akron, Ohio
Filed Jul. 11, 1988, Ser. No. 217,573
Term of patent 14 years
U.S. Cl. D12—142

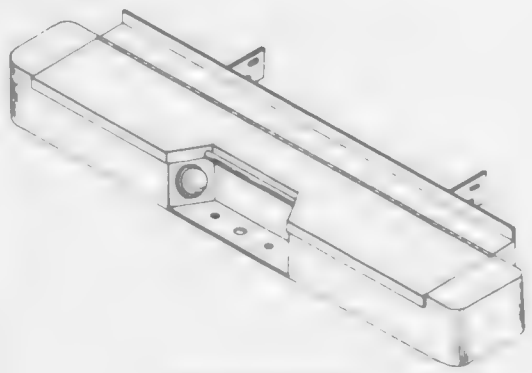
316,065
AUTOMOBILE TIRE
Toru Tsuda, Tokyo; Yasutaka Enoki, Saitama, and Tetsuhito Tsukagoshi, Tokyo, all of Japan, assignors to Bridgestone Corp., Tokyo, Japan
Filed Feb. 28, 1989, Ser. No. 317,307
Claims priority, application Japan, Aug. 31, 1988, 63-34114
Term of patent 14 years
U.S. Cl. D12—142



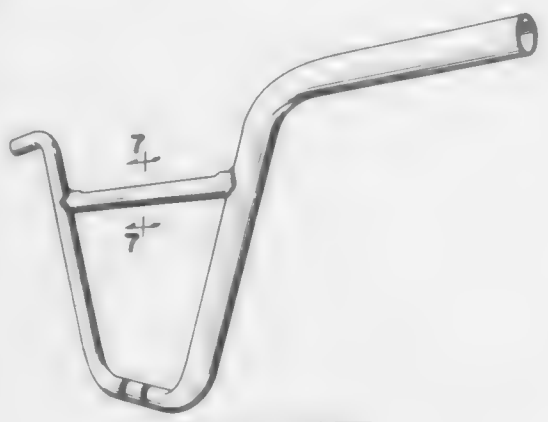
316,066
TIRE
Michael I. Wischhusen, Greenville, S.C., assignor to Michelin Recherche et Technique, Basel, Switzerland
Filed Jan. 12, 1989, Ser. No. 296,795
Term of patent 14 years
U.S. Cl. D12—143



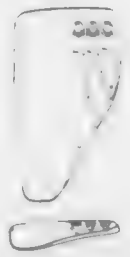
316,067
TIRE
Philip S. Hammond, Uniontown, and Paul B. Maxwell, Akron, both of Ohio, assignors to The Goodyear Tire & Rubber Company, Akron, Ohio
Filed Jan. 12, 1989, Ser. No. 296,154
Term of patent 14 years
U.S. Cl. D12—146



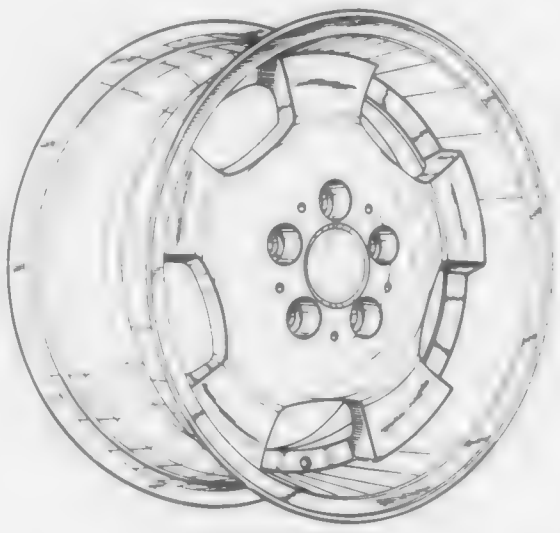
316,068
ADJUSTABLE LUGGAGE CARRIER CROSS RAIL WITH LOCKING LEVER
William A. Rasor, Goodells, and Craig Stapleton, Port Huron, both of Mich., assignors to Huron/St. Clair Incorporated, Port Huron, Mich.
Filed May 3, 1988, Ser. No. 192,403
Term of patent 14 years
U.S. Cl. D12—157



316,069
TRAILER HITCH COVER
Roderick E. Yocum, 11615 Detwiler, Columbiana, Ohio 44408
Filed Sep. 14, 1988, Ser. No. 244,254
Term of patent 14 years
U.S. Cl. D12—162

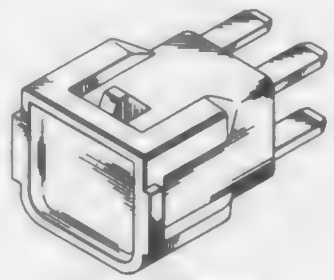


316,070
VEHICLE BUMPER
Andrew A. Riss, c/o Breezewood, Inc., P.O. Box 266, Reynoldsville, Pa. 15851
Filed Feb. 18, 1988, Ser. No. 157,336
Term of patent 14 years
U.S. Cl. D12—169

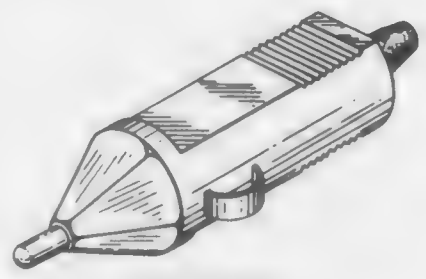


316,071
BICYCLE HANDLEBAR
David K. McMurtrey, Maysville, Ky., assignor to Leggett & Platt, Incorporated, Carthage, Mo.
Filed Jul. 14, 1986, Ser. No. 885,432
Term of patent 14 years
U.S. Cl. D12—178

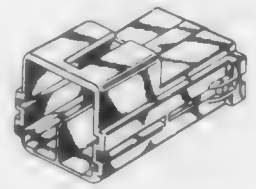
316,072
AUTOMOTIVE HOOD SCOOP
Mark Wayne, 29436 Briarbank Ct., Southfield, Mich. 48034
Filed Nov. 17, 1989, Ser. No. 437,922
Term of patent 14 years
U.S. Cl. D12—190



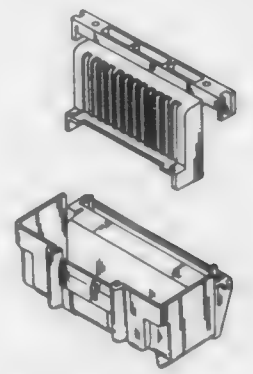
316,073
WHEEL
Adolf Koch, Waiblingen-Neustadt, Fed. Rep. of Germany, assignor to Sport-Service-Lorinser Sportliche Autoausrüstung GmbH, Waiblingen, Fed. Rep. of Germany
Filed Dec. 12, 1985, Ser. No. 808,430
Claims priority, application Fed. Rep. of Germany, Jul. 11, 1985, 1036
Term of patent 14 years
U.S. Cl. D12—211



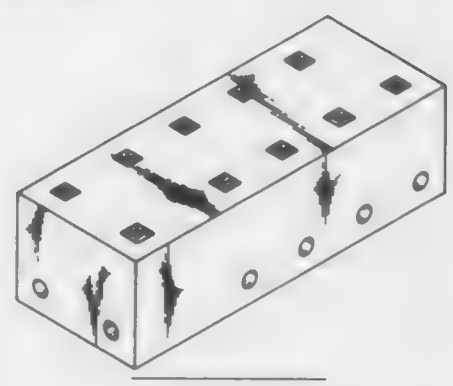
316,074
SAILING CRAFT
Toshiharu Yamada, Cypress, Calif., and Kunihiko Kobayashi, Iwata, Japan, assignors to Yamaha Hatsudoki Kabushika Kaisha, Iwata, Japan
Filed Feb. 24, 1989, Ser. No. 315,691
Term of patent 14 years
U.S. Cl. D12—303



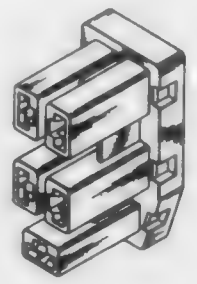
316,075
NOISE ELIMINATOR
Shizuo Tsubokura; Kunio Hoshino, and Itsuo Takayanagi, all of Shizuoka, Japan, assignors to Yazaki Corporation, Japan
Filed Sep. 8, 1988, Ser. No. 242,051
Claims priority, application Japan, Mar. 10, 1988, 63-9524
Term of patent 14 years
U.S. Cl. D13—123



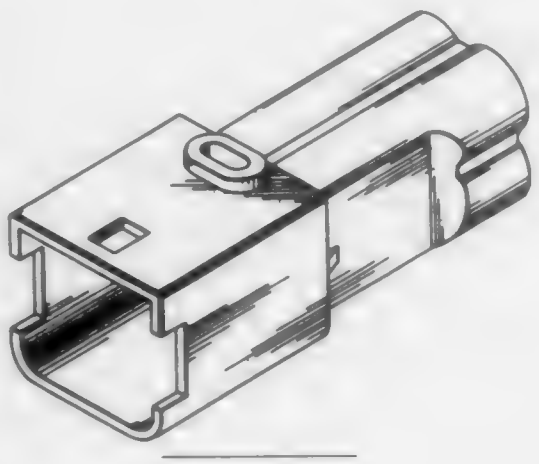
316,076
D.C. POWER CORD PLUG
Carolyn Keating, Weston, Canada, assignor to Brukar Industries Canada Limited, Etobicoke, Canada
Filed Jul. 12, 1988, Ser. No. 218,597
Claims priority, application Canada, Jun. 22, 1988, 22-06-88-20
Term of patent 14 years
U.S. Cl. D13—133



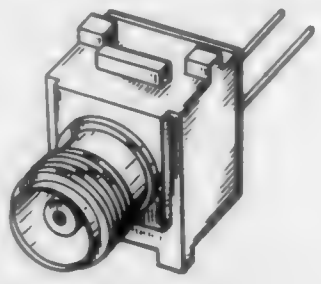
316,077
ELECTRICAL CONNECTOR HOUSING
Kenji Takenouchi; Toshihiko Makita, and Teruhisa Norizuki, all of Shizuoka, Japan, assignors to Yazaki Corporation, Tokyo, Japan
Filed Oct. 26, 1988, Ser. No. 263,125
Claims priority, application Japan, Apr. 28, 1988, 63-17050
Term of patent 14 years
U.S. Cl. D13—133



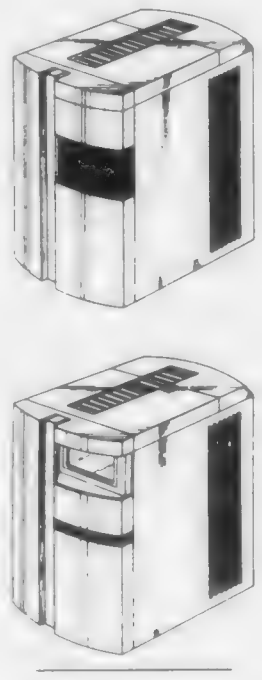
316,078
ELECTRICAL CONNECTOR ASSEMBLY
Yasuharu Moriai, and Osamu Ito, both of Suzuka, Japan, assignors to Sumitomo Wiring Systems, Ltd., Yokkaichi, Japan
Filed Dec. 21, 1988, Ser. No. 288,004
Claims priority, application Japan, Jun. 21, 1988, 63-24590
Term of patent 14 years
U.S. Cl. D13—133



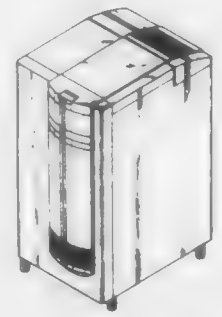
316,079
WIRE CONNECTOR
W. Bohdan Sulikowski, 5807 South 41 St., Greenfield, Wis. 53221
Filed Sep. 9, 1987, Ser. No. 94,525
Term of patent 14 years
U.S. Cl. D13—147



316,080
HOUSING FOR AN ELECTRICAL CONNECTOR
Shigemitsu Inabe, Shizuoka, Japan, assignor to Yazaki Corporation, Japan
Filed Oct. 7, 1988, Ser. No. 255,718
Claims priority, application Japan, Apr. 7, 1988, 63-13735
Term of patent 14 years
U.S. Cl. D13—146

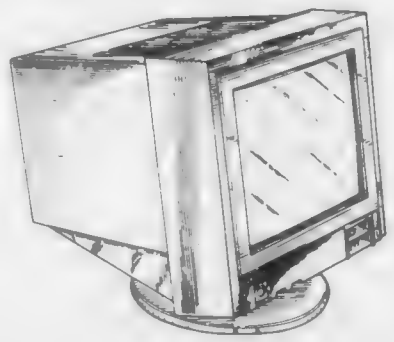


316,081
CONNECTOR HOUSING FOR A NOISE ELIMINATOR
Shizuo Tsubokura; Kunio Hoshino, and Itsuo Takayanagi, all of Shizuoka, Japan, assignors to Yazaki Corporation, Japan
Filed Sep. 8, 1988, Ser. No. 242,053
Claims priority, application Japan, Mar. 10, 1988, 63-9523
Term of patent 14 years
U.S. Cl. D13—147

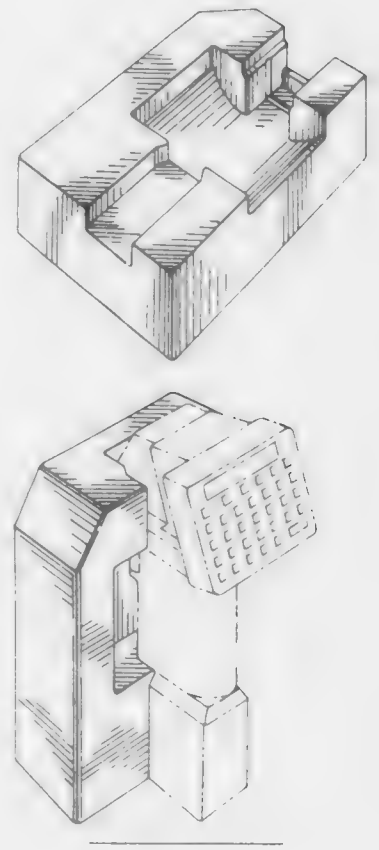


316,082
TELECOMMUNICATIONS CONNECTOR
Jay Gartwhaite, Coupeville, Wash., assignor to Leviton Manufacturing Co., Inc., Little Neck, N.Y.
Filed Dec. 7, 1988, Ser. No. 281,317
Term of patent 14 years
U.S. Cl. D13—151

316,083
ARITHMETIC PROCESSOR FOR USE IN ELECTRONIC COMPUTERS
Tetsuji Abe, Hyogo, and Hunito Mishiro, Osaka, both of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Japan and Solutions Are Everything, Inc., Colo.
Filed Apr. 8, 1988, Ser. No. 179,118
Claims priority, application Japan, Dec. 15, 1987, 62-51130
Term of patent 14 years
U.S. Cl. D14—102

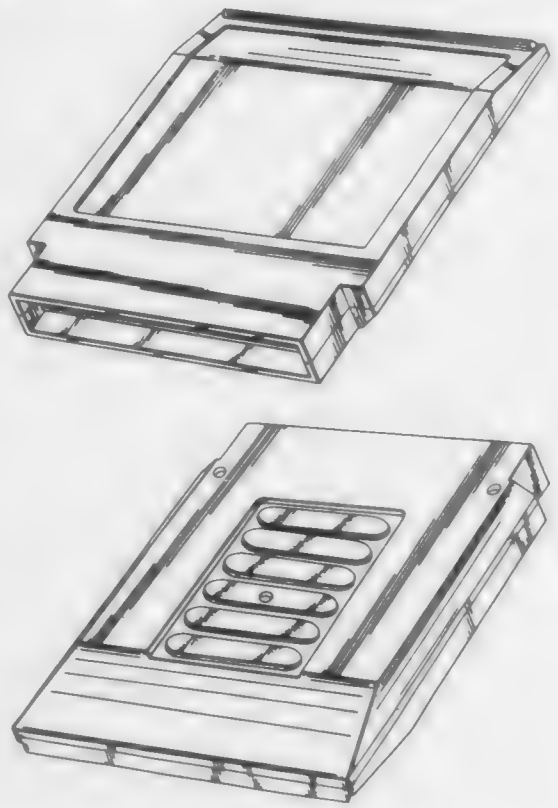


316,084
ARITHMETIC PROCESSOR FOR USE IN ELECTRONIC COMPUTERS
Tetsuya Imamura; Benito Mishiro, both of Osaka, and Yoshihiko Sugiyama, Nara, all of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Japan and Solutions Are Everything, Inc., Colo.
Filed Apr. 8, 1988, Ser. No. 179,127
Claims priority, application Japan, Dec. 15, 1987, 62-51131
Term of patent 14 years
U.S. Cl. D14—102

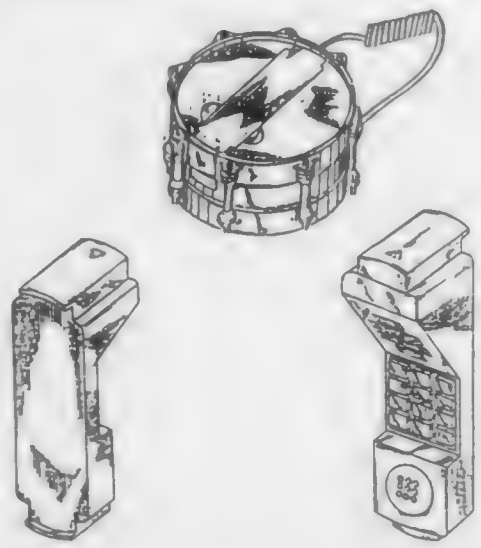


316,085
PORTABLE ELECTRONIC COMPUTER
Iino Masaaki, Yokohama, Japan, assignor to Kabushiki Kaisha Toshiba, Kanagawa, Japan
Filed Nov. 22, 1988, Ser. No. 274,945
Claims priority, application Japan, May 23, 1988, 63-19969
Term of patent 14 years
U.S. Cl. D14—106

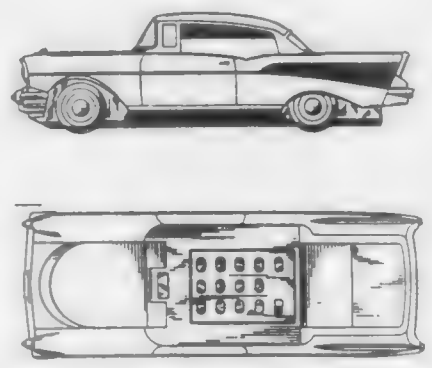
316,086
VIDEO DISPLAY TERMINAL
Stig Gauffin, Stockholm, Sweden, assignor to Facit AB, Sundbyberg, Sweden
Filed Aug. 14, 1987, Ser. No. 85,614
Claims priority, application Sweden, Feb. 25, 1987, 87-0436
Term of patent 14 years
U.S. Cl. D14—113



316,087
RECEPTACLE FOR ELECTRONIC BAR CODE READER
James R. Meckstroth; Donna E. Goodner, and Keving J. Ahearn, all of Charlotte, N.C., assignors to Hand Held Products, Inc., Charlotte, N.C.
Filed Sep. 30, 1988, Ser. No. 251,892
Term of patent 14 years
U.S. Cl. D14—114

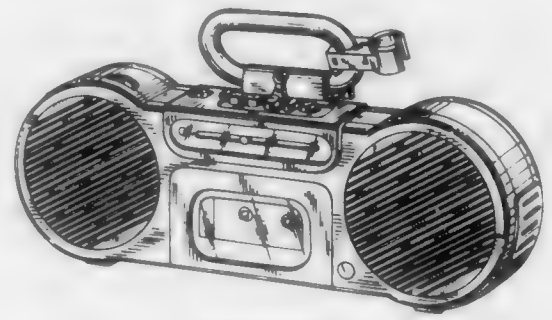


316,088
ADAPTOR FOR AN 8 CM COMPACT DISK
Eiji Yamamori, Tokyo, Japan, assignor to Sony Corporation, Tokyo, Japan
Filed May 17, 1988, Ser. No. 195,012
Claims priority, application Japan, Jan. 11, 1987, 63-640
Term of patent 14 years
U.S. Cl. D14—126



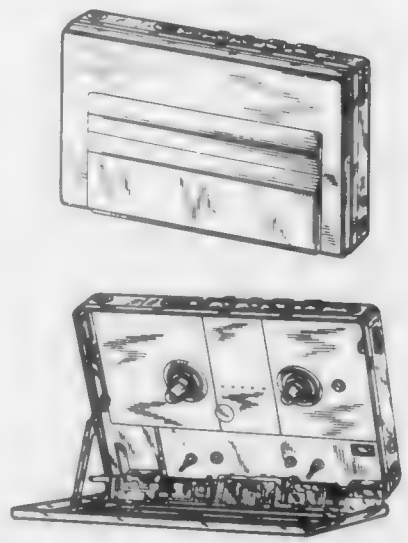
316,089
GAME CARTRIDGE
Yoshiaki Nakauma, Chigasaki, Japan, assignor to Namco Ltd., Japan
Filed Dec. 15, 1988, Ser. No. 284,479
Term of patent 14 years
U.S. Cl. D14—121

316,090
COMBINED TELEPHONE STAND AND INTEGRAL HANDSET TELEPHONE
Gregory C. Holloway, and Lynnette M. Holloway, both of General Delivery, PSC-1 Box 3000, Elmendorf AFB, Ak. 99506, assignors to Gregory Holloway and Lynnette Holloway
Filed Dec. 27, 1988, Ser. No. 290,564
Term of patent 14 years
U.S. Cl. D14—143

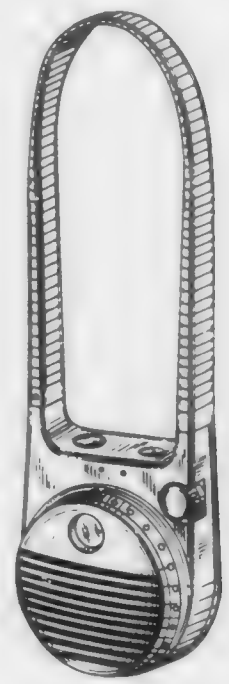


316,091
TELEPHONE SET
Kash Gobindram, Ronkonkoma, N.Y., assignor to [illegible] 'N' Gold, Ltd., Ronkonkoma, N.Y.
Filed Mar. 12, 1990, Ser. No. 493,671
Term of patent 14 years
U.S. Cl. D14—143

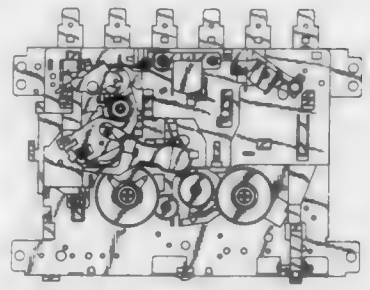
316,092
COMBINED AUTOMOBILE TAPE PLAYER AND RADIO RECEIVER
Young H. Ham, Seoul, Rep. of Korea, assignor to Goldstar Co., Ltd., Seoul, Rep. of Korea
Filed Dec. 14, 1988, Ser. No. 284,444
Claims priority, application Rep. of Korea, Jun. 23, 1988, 8605/1988
Term of patent 14 years
U.S. Cl. D14—157



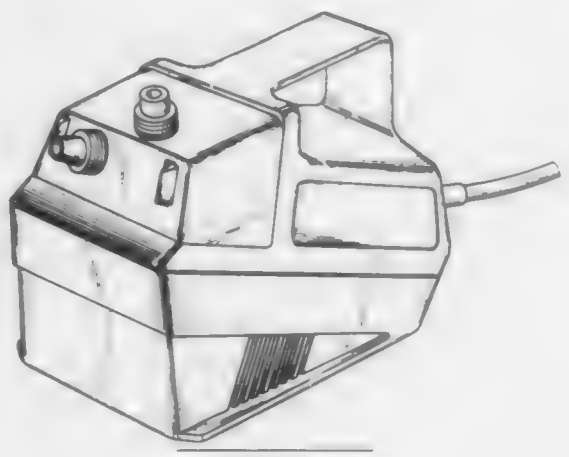
316,093
COMBINED TAPE RECORDER AND RADIO RECEIVER
Akiyoshi Okada, Tokyo, and Ichiro Hino, Kanagawa, both of Japan, assignors to Sony Corporation, Tokyo, Japan
Filed Mar. 8, 1989, Ser. No. 320,932
Claims priority, application Japan, Sep. 8, 1988, 63-35573
Term of patent 14 years
U.S. Cl. D14—163



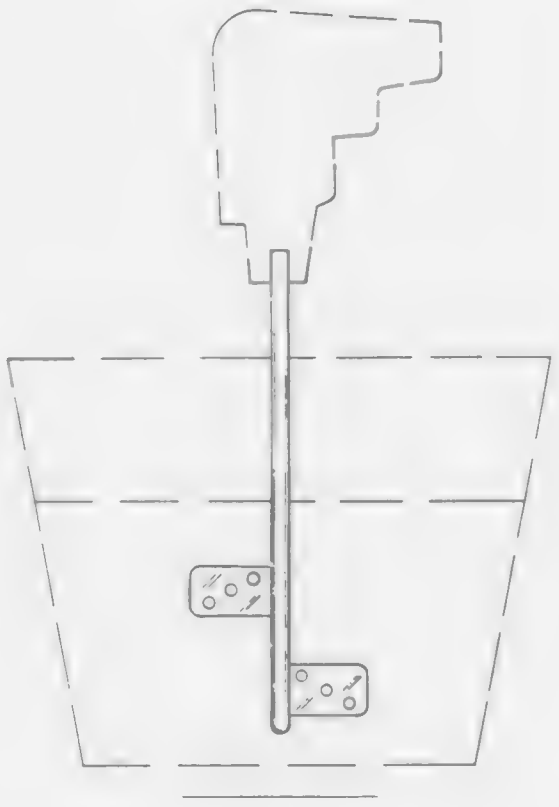
316,094
TAPE PLAYER
Masayoshi Tsuchiya, Tokyo, Japan, assignor to Sony Corporation, Tokyo, Japan
Filed Dec. 6, 1988, Ser. No. 280,528
Claims priority, application Japan, Jun. 6, 1988, 63-22302
Term of patent 14 years
U.S. Cl. D14—165



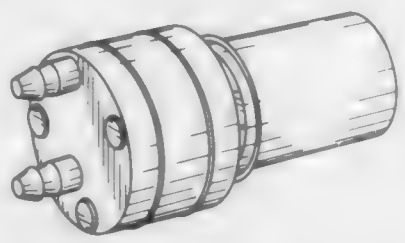
316,095
TAPE PLAYER
Masayoshi Tsuchiya, Tokyo, Japan, assignor to Sony Corporation, Tokyo, Japan
Filed Dec. 6, 1988, Ser. No. 280,530
Claims priority, application Japan, Jun. 6, 1988, 63-22303
Term of patent 14 years
U.S. Cl. D14—165



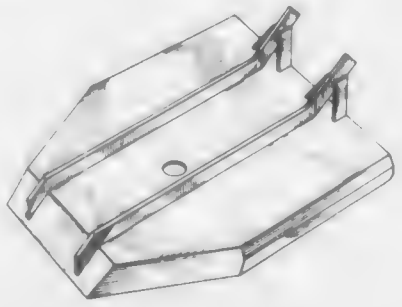
316,096
RADIO RECEIVER OR THE LIKE
Atsuo Nagai; Fumitaka Kikutani, and Takahiko Suzuki, all of Tokyo, Japan, assignors to Sony Corporation, Tokyo, Japan
Filed May 17, 1988, Ser. No. 195,017
Claims priority, application Japan, Nov. 17, 1987, 62-47047
Term of patent 14 years
U.S. Cl. D14—196



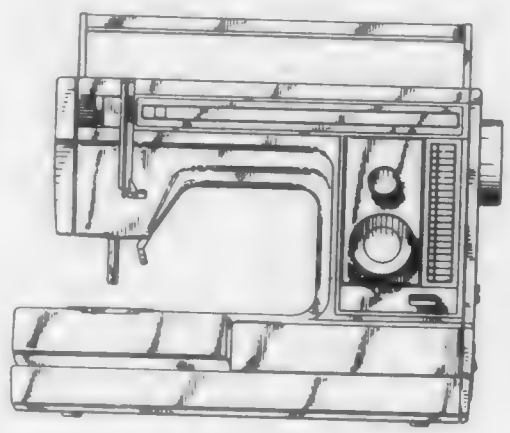
316,097
TAPE DRIVE UNIT FOR A TAPE RECORDER
Shinsaku Tanaka, Tokyo, and Tadao Arata, Inagi, both of Japan, assignors to Tanashin Denki Co., Ltd., Tokyo, Japan
Filed Mar. 18, 1987, Ser. No. 27,510
Term of patent 14 years
U.S. Cl. D14—260



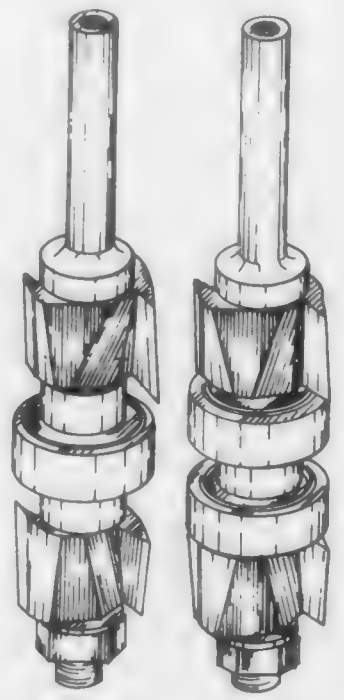
316,098
FEED PUMP FOR A PAINTING APPARATUS
Ewald Kille, Friedrichshafen, Fed. Rep. of Germany, assignor to J. Wagner GmbH, Fed. Rep. of Germany
Filed Apr. 10, 1989, Ser. No. 335,512
Claims priority, application Fed. Rep. of Germany, Oct. 12, 1988, 88024725
Term of patent 14 years
U.S. Cl. D15—7



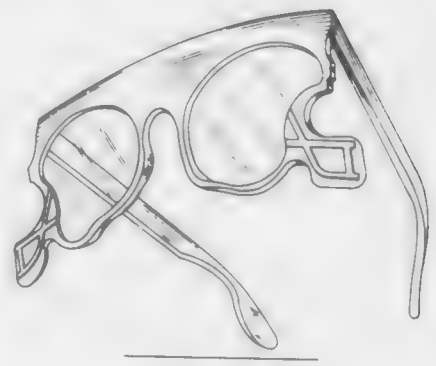
316,100
POWER-DRIVEN STIRRER FOR DRYWALL COMPOUND, PAINT, OR THE LIKE
Francis J. Kief, 1954 Church Rd., Baltimore, Md. 21222
Filed Sep. 2, 1988, Ser. No. 240,228
Term of patent 14 years
U.S. Cl. D15—19



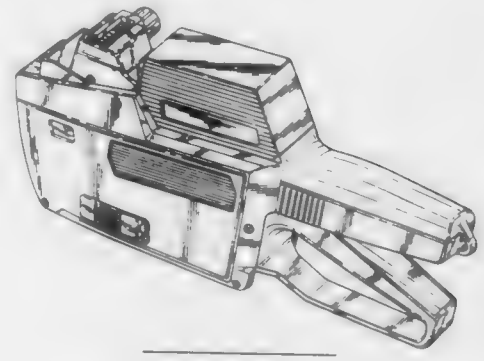
316,099
SUBMERSIBLE PUMP
Niels H. Hartz, Huskvarna, Sweden, assignor to Aktiebolaget Electrolux, Stockholm, Sweden
Filed Jun. 1, 1989, Ser. No. 360,209
Claims priority, application Sweden, Dec. 15, 1988, 88-2900
Term of patent 14 years
U.S. Cl. D15—7



316,101
ROTARY CUTTER HOUSING FOR MOWERS OR THE LIKE
James E. McCanse, Oregon, Ill., and Richard E. TenEyck, Wichita, Kans., assignors to M&W Gear Company, Gibson City, Ill.
Filed Sep. 19, 1988, Ser. No. 246,527
Term of patent 14 years
U.S. Cl. D15—27

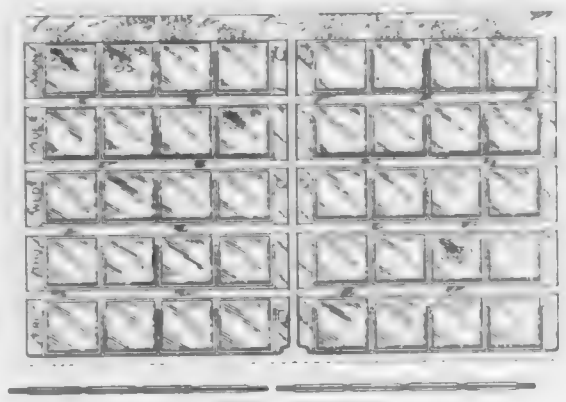


316,102
SEWING MACHINE
Koji Uchida, Hachioji, Japan, assignor to Janome Sewing Machine Co., Ltd., Tokyo, Japan
Filed Sep. 2, 1986, Ser. No. 903,116
Term of patent 14 years
U.S. Cl. D15—70



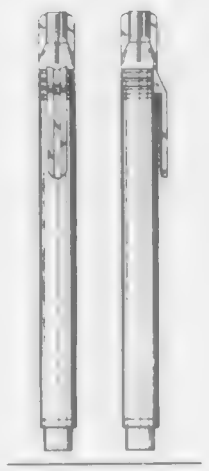
316,103
ROUTER BIT
Will M. Lassiter, 1703 Deep River Rd., High Point, N.C. 27260
Filed Jun. 16, 1989, Ser. No. 367,224
Term of patent 14 years
U.S. Cl. D15—139

316,104
SUNGLASSES
Robby L. Reynolds; Debbie Reynolds, and Justin Reynolds, all of 1417 Raquel La., Modesto, Calif. 95355
Filed May 9, 1988, Ser. No. 192,115
Term of patent 14 years
U.S. Cl. D16—102



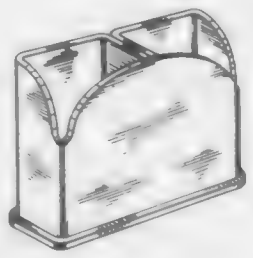
316,105
HAND-HELD LABELLING GUN
Klaus-Dieter Hermann, Ritterweg 17, D-6932 Hirschhorn, Fed. Rep. of Germany
Filed May 12, 1988, Ser. No. 193,490
Claims priority, application Fed. Rep. of Germany, Nov. 17, 1987, 439
Term of patent 14 years
U.S. Cl. D18—19

316,106
HAND HELD COPYING MACHINE
Katsumi Yamatogi, Tokyo, Japan, assignor to Sony Corporation, Tokyo, Japan
Filed Jul. 27, 1988, Ser. No. 224,784
Claims priority, application Japan, Jan. 29, 1988, 63-3335
Term of patent 14 years
U.S. Cl. D18—36

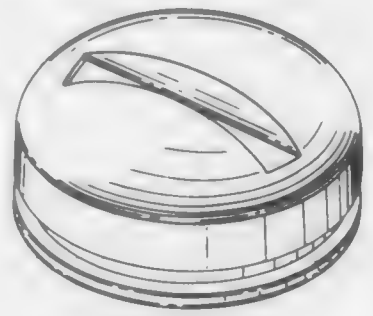


316,107
DATED HOLDER FOR MAINTAINING AND DISPLAYING LESSON PLANNING CARDS
Vivian S. Lockner, Rte. 2, Box 2345, Bluff City, Tenn. 37618
Filed Apr. 17, 1989, Ser. No. 339,584
Term of patent 14 years
U.S. Cl. D19—20

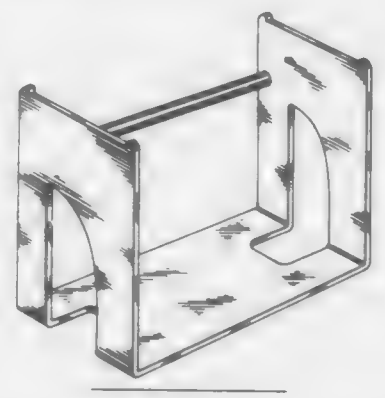
316,108
FILE FOLDER
Jacques Gerriet, Fleury sur Andelle, France, assignor to Arianex Systemes, Bernay, France
Filed Nov. 16, 1987, Ser. No. 121,146
Claims priority, application France, May 14, 1987, 87 2854
Term of patent 14 years
U.S. Cl. D19—26



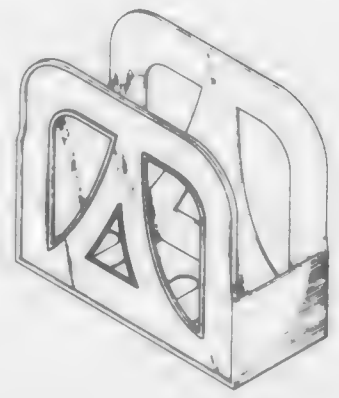
316,109
MARKER PEN
George Pappageorge, Englewood Cliffs, N.J., assignor to Mark-Tex Corporation, Englewood, N.J.
Filed Jan. 11, 1988, Ser. No. 421,401
Term of patent 14 years
U.S. Cl. D19—48



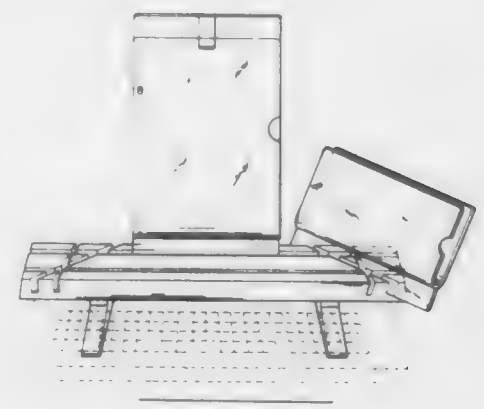
316,110
CLIP
Kurt Lorber, Aichwald, Fed. Rep. of Germany, assignor to Laurel-Plastic Kurt Lorber, Fed. Rep. of Germany
Filed Jul. 21, 1988, Ser. No. 222,574
Claims priority, application World Int. Prop. O., Jun. 20, 1988, DM/011 187
Term of patent 14 years
U.S. Cl. D19—65



316,111
HOLDER FOR WRITING INSTRUMENTS
Robert E. Hawes, Jr., Huntington Bay, and Eric Aaldenberg, Bayside, both of N.Y., assignors to Esselte Pendaflex Corporation, Garden City, N.Y.
Filed Mar. 22, 1988, Ser. No. 171,533
Term of patent 14 years
U.S. Cl. D19—85

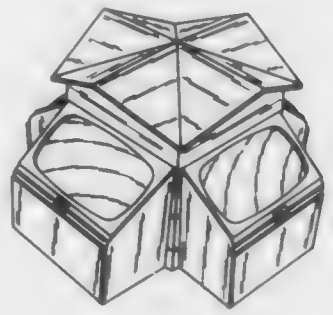


316,112
NOTEPAPER DISPENSER
David C. Windorski, St. Paul, Minn., assignor to Minnesota Mining and Manufacturing Company, St. Paul, Minn.
Filed Jan. 8, 1988, Ser. No. 204,218
Term of patent 14 years
U.S. Cl. D19—86

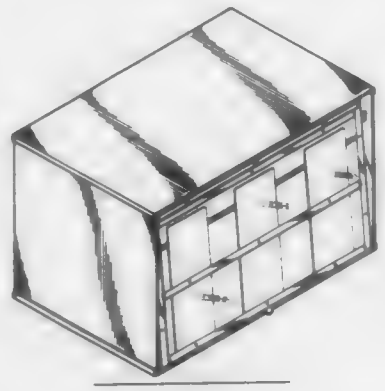


316,113
RACK FOR HANGING FILE FOLDERS
Robert E. Hawes, Jr., Huntington Bay, and Eric Aaldenberg, Bayside, both of N.Y., assignors to Esselte Pendaflex Corporation, Garden City, N.Y.
Filed Mar. 22, 1988, Ser. No. 171,538
Term of patent 14 years
U.S. Cl. D19—90

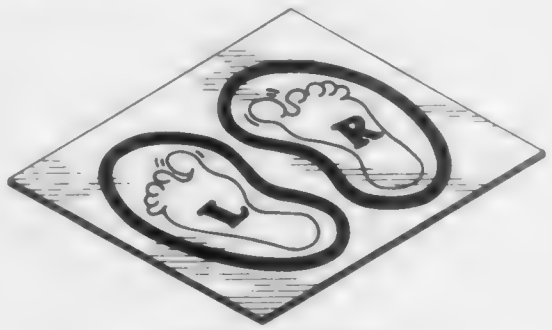
316,114
VERTICAL FILE RACK
Shih-Ming Hwang, No. 11, Alley 12, Lane 7, Ching-Tyan Street, Taipei, Taiwan
Filed Mar. 28, 1988, Ser. No. 179,894
Term of patent 14 years
U.S. Cl. D19—90



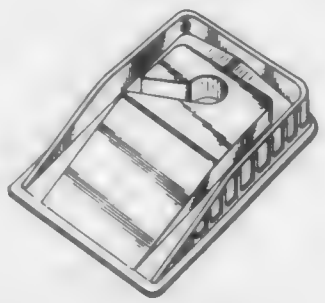
316,115
DOCUMENT HOLDER FOR A COMPUTER TERMINAL
Dale G. Davis, Warren, Mich., and Shane E. Davis, 8228 Paige, Warren, Mich. 48089, assignors to Shane E. Davis, Warren, Mich.
Filed Mar. 18, 1988, Ser. No. 169,774
Term of patent 14 years
U.S. Cl. D19—91



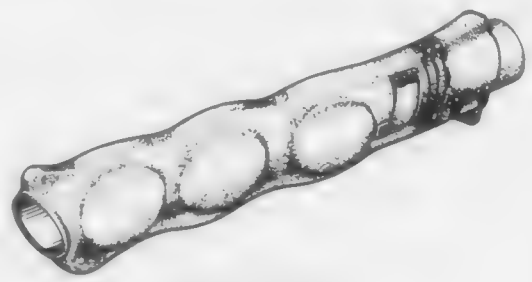
316,116
NOTE TRAY
Robert E. Hawes, Jr., Huntington Bay, and Eric Aaldenberg, Bayside, both of N.Y., assignors to Esselte Pendaflex Corporation, Garden City, N.Y.
Filed Mar. 22, 1988, Ser. No. 171,532
Term of patent 14 years
U.S. Cl. D19—92



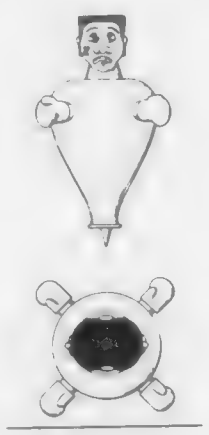
316,117
MULTIPLE UNIT VENDING MACHINE
Eldin H. Irwin, 225 Rue de Paresse, Tavares, Fla. 32778
Filed Feb. 2, 1987, Ser. No. 9,930
The portion of the term of this patent subsequent to Apr. 2, 2005, has been disclaimed.
Term of patent 14 years
U.S. Cl. D20—4



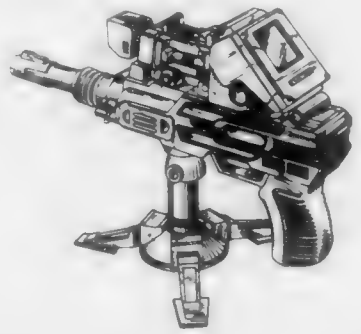
316,118
NEWSPAPER RACK
Lawrence Cole, 400 Valencia St., San Francisco, Calif. 94103
Filed Jan. 16, 1990, Ser. No. 445,349
Term of patent 14 years
U.S. Cl. D20—6



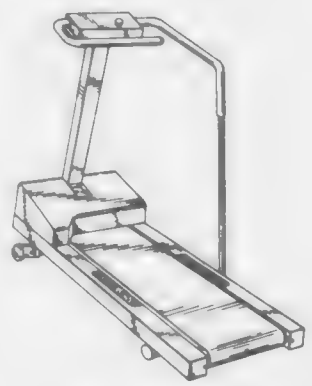
316,119
DECAL SET FOR INSTRUCTING CHILDREN IN THE PROPER USE OF FOOTWEAR
Bruce B. McDermott; Karen A. McDermott, and Christopher B. Ammond, all of Cherry Hill, N.J., assignors to Karbyco International, Cherry Hill, N.J.
Filed Feb. 2, 1988, Ser. No. 152,593
Term of patent 14 years
U.S. Cl. D20—11



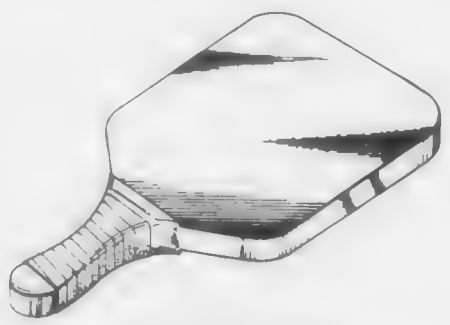
316,120
GOLF PUTTING DEVICE
Saul Morris; David J. Morris, both of Chattanooga, Tenn., and Michael R. Baya, Marietta, Ga., assignors to Habitat International, Inc., Roosville, Ga.
Filed Oct. 7, 1987, Ser. No. 105,321
Term of patent 14 years
U.S. Cl. D21—8



316,121
BLOWING TOY
Jeffrey A. Alward, Chicago, Ill., assignor to Strombecker Corporation, Chicago, Ill.
Filed Sep. 6, 1988, Ser. No. 240,577
Term of patent 14 years
U.S. Cl. D21—48

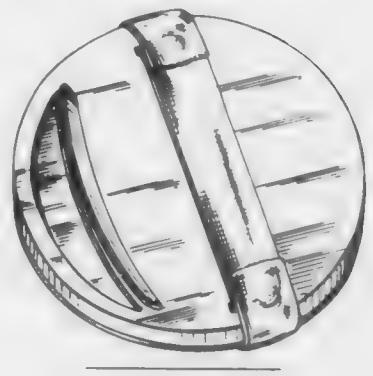


316,122
BOXING TOP
Roger L. Watford, 2126 Wilderness Point, Kingwood, Tex. 77339
Filed Jun. 20, 1988, Ser. No. 209,044
Term of patent 14 years
U.S. Cl. D21—95

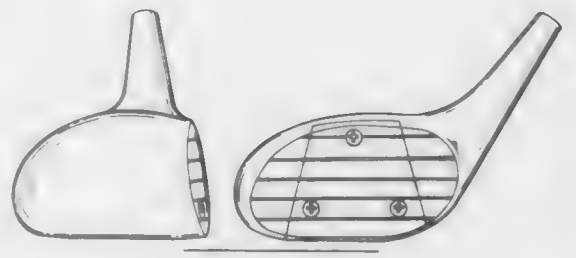


316,123
TOY GUN
Joseph J. C. Shiung-Fei, Kowloon, Hong Kong, assignor to Tiger Electronics, Inc., Vernon Hills, Ill.
Filed Sep. 9, 1988, Ser. No. 243,050
Term of patent 14 years
U.S. Cl. D21—146

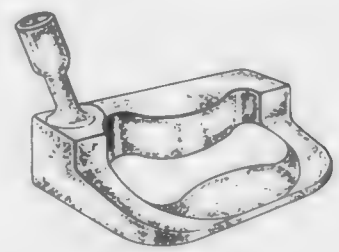
316,124
TREADMILL WITH SIDERAIL
William T. Dalebout, and Ty Measom, both of Logan, Utah, assignors to Weslo, Inc., Logan, Utah
Filed Jan. 19, 1989, Ser. No. 299,746
Term of patent 14 years
U.S. Cl. D21—192



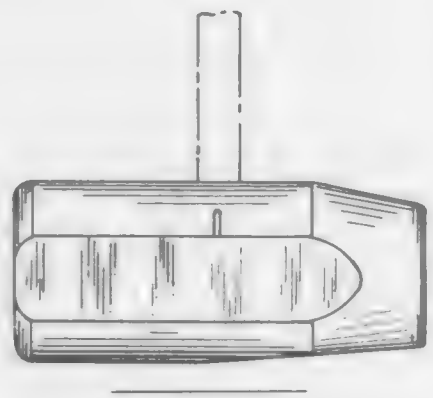
316,125
SPORTS PADDLE
John E. Poulakis, 2180 Tillingham Ct., Dunwoody, Ga. 30338
Filed May 6, 1988, Ser. No. 190,953
The portion of the term of this patent subsequent to Apr. 9, 2005, has been disclaimed.
Term of patent 14 years
U.S. Cl. D21—213



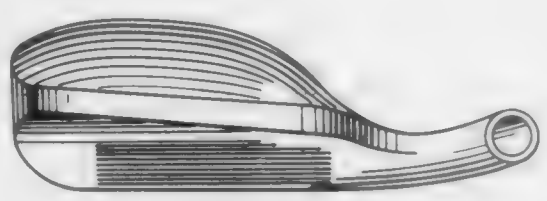
316,126
SPORTS PADDLE
John E. Poulakis, 2180 Tillingham Ct., Dunwoody, Ga. 30338
Filed May 6, 1988, Ser. No. 190,954
The portion of the term of this patent subsequent to Apr. 9, 2005, has been disclaimed.
Term of patent 14 years
U.S. Cl. D21—213



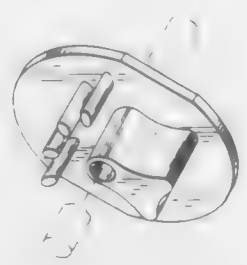
316,127
GAME PADDLE
Wildon Dumaine, 11 Bay 47th St., Brooklyn, N.Y. 11214
Filed Oct. 28, 1988, Ser. No. 264,184
Term of patent 14 years
U.S. Cl. D21—213



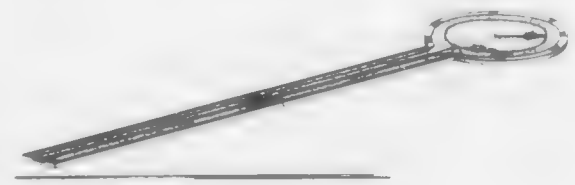
316,128
GOLF CLUB HEAD
Robert D. Kinney, III, 30 Ravensworth, Conroe, Tex. 77302
Filed Jul. 28, 1988, Ser. No. 225,704
Term of patent 14 years
U.S. Cl. D21—214



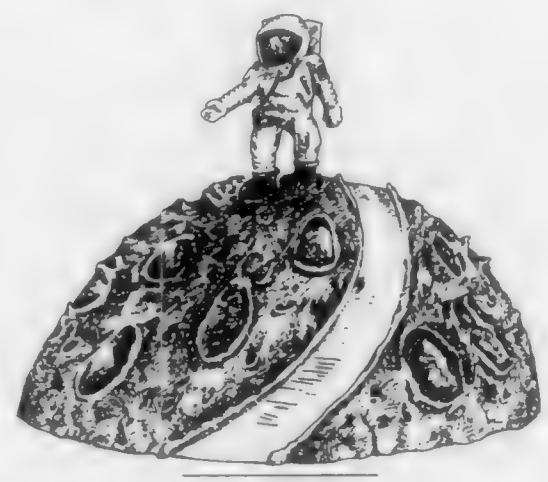
316,129
GOLF PUTTER HEAD
Thomas W. Bryson, P.O. Box 100, Canmore, Alberta, Canada T0L 0M0
Filed Jun. 22, 1988, Ser. No. 211,299
Claims priority, application Canada, Dec. 23, 1987, 22-12-87-3
Term of patent 14 years
U.S. Cl. D21—217



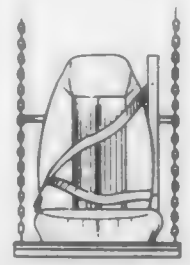
316,130
PUTTER HEAD
Leonard Urban, 39 Birch Dr., Swoyersville, Pa. 18704
Filed Aug. 15, 1988, Ser. No. 233,112
Term of patent 14 years
U.S. Cl. D21—218



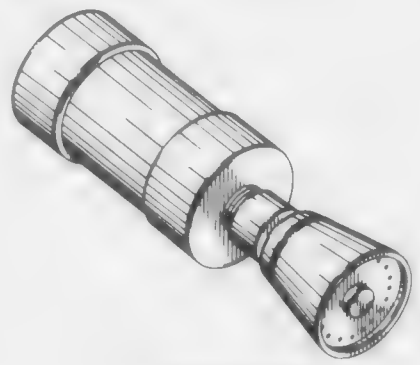
316,131
IRON GOLF CLUB HEAD
Anthony J. Antonious, 205 E. Joppa Rd., Towson, Md. 21204
Filed Jun. 16, 1988, Ser. No. 207,451
Term of patent 14 years
U.S. Cl. D21—220



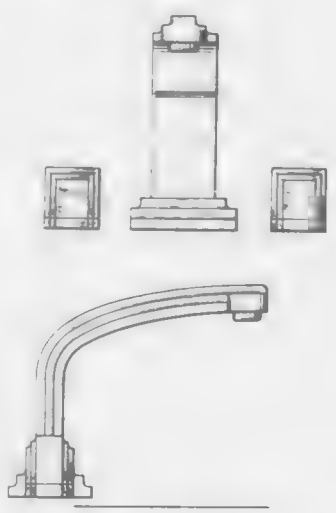
316,132
SKI POLE BASKET
John H. Ehlert, 6606 Rock Ledge Dr., Brecksville, Ohio 44141
Filed Jun. 27, 1988, Ser. No. 211,849
Term of patent 14 years
U.S. Cl. D21—230



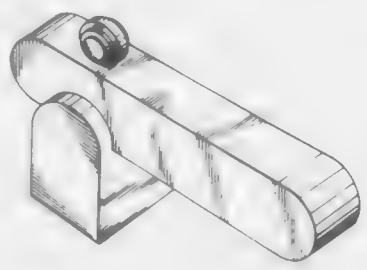
316,133
BILLIARD TRAINING AID
William F. Weiss, Jr., P.O. Box 5512, Auburn, Calif. 95604
Filed Jun. 24, 1988, Ser. No. 211,323
Term of patent 14 years
U.S. Cl. D21—232



316,134
PLAYGROUND SLIDE
Constantine P. Gianacakos, 17652 Robbins Rd., Grand Haven, Mich. 49417
Filed Apr. 10, 1989, Ser. No. 335,5[illegible]
Term of patent 14 years
U.S. Cl. D21—244

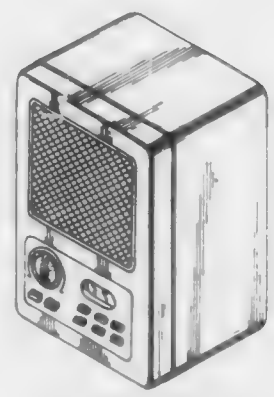


316,135
RESTRAINING SAFETY SWING SEAT
John A. Barber, Jr., 39 Pitken St., Burlington, Vt. 05401
Filed Apr. 22, 1988, Ser. No. 184,713
Term of patent 14 years
U.S. Cl. D21—246

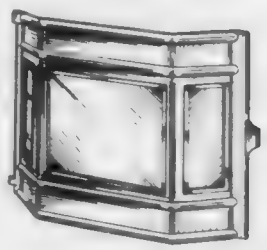


316,136
COMBINED SHOWER HEAD AND FILTER
David Underwood, 7713 Sagebrush Ct. South, N. Richland Hills, Tex. 76180
Filed Sep. 5, 1989, Ser. No. 402,247
Term of patent 14 years
U.S. Cl. D23—228

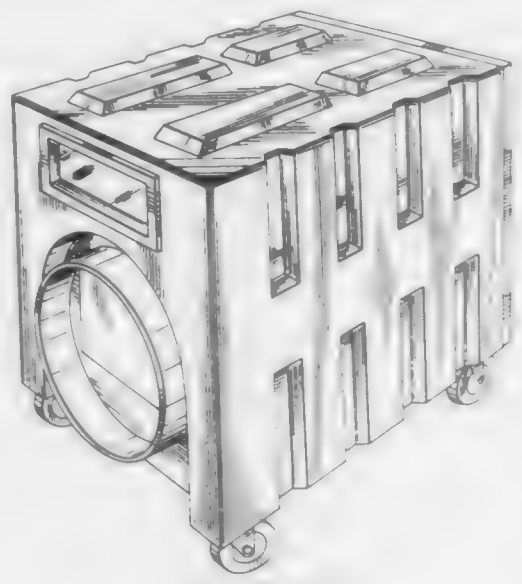
316,137
FAUCET SET
Regina Razumov, San Diego, Calif., assignor to Harden Industries, Inc., Los Angeles, Calif.
Filed Jan. 22, 1988, Ser. No. 146,821
Term of patent 14 years
U.S. Cl. D23—242



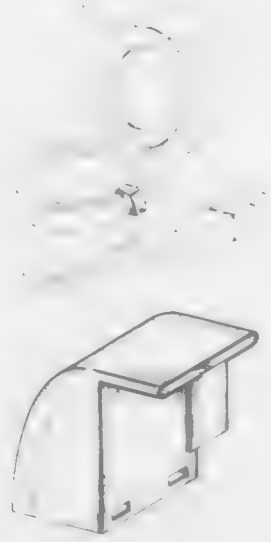
316,138
LAVATORY SPOUT
Stanley M. Paul, Rye, N.Y., assignor to Paul Associates, Inc., Long Island City, N.Y.
Filed May 6, 1988, Ser. No. 1[illegible],937
Term of patent 14 years
U.S. Cl. D23—257



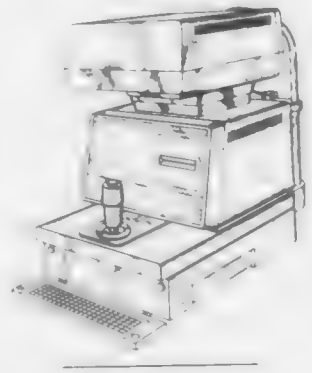
316,139
BATHTUB HAND RAIL
Fred DiVito, Asharoken; Christopher Beal, Lindenhurst, and Joseph Zanetti, East Islip, all of N.Y., assignors to Lumex, Inc., Bay Shore, N.Y.
Filed Nov. 19, 1987, Ser. No. 122,419
Term of patent 14 years
U.S. Cl. D23—303



316,140
ELECTRIC HEATER
Wen T. Lee, Tainan, Taiwan, assignor to Chao-Yang Electric Mfg., Co., Ltd., Tainan, Taiwan
Filed Apr. 14, 1989, Ser. No. 338,130
Term of patent 14 years
U.S. Cl. D23—335

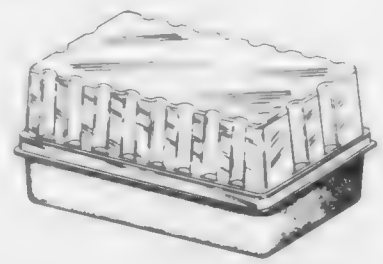


316,141
WOOD STOVE DOOR
Oliver J. Whitfield, 4208 242nd St. SW., Mountlake Ter., Wash. 98043
Filed Mar. 8, 1989, Ser. No. 321,[illegible]
Term of patent 14 years
U.S. Cl. D23—347



316,142
AIR PURIFICATION UNIT
Rickey S. Lutterbach, and Jeffrey A. Granacki, both of Michigan City, Ind., assignors to Control Resource Systems, Inc., Michigan City, Ind.
Filed Feb. 15, 1989, Ser. No. 310,712
Term of patent 14 years
U.S. Cl. D23—364

316,143
NOZZLE FOR COMMODE DEODERIZER
Jan D. Lipps, P.O. Box 94, Stinnett, Tex. 79083
Filed Apr. 26, 1988, Ser. No. 186,221
Term of patent 14 years
U.S. Cl. D23—371



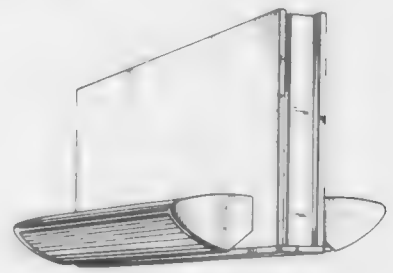
316,144
REFRACTOMETER
Hiroshi Nishimura, Tokyo, Japan, assignor to Canon Kabushiki Kaisha, Tokyo, Japan
Filed Aug. 9, 1988, Ser. No. 230,114
Claims priority, application Japan, Feb. 12, 1988, 63-5419
Term of patent 14 years
U.S. Cl. D24—17

316,145
COMBINED AUTOMATIC IMPLANTABLE CARDIOVERTER AND DEFIBRILLATOR
Lyle A. Ware, Bloomington, Minn., assignor to Mieczyslaw Mirowski, Owings Mills, Md.
Filed Jun. 23, 1987, Ser. No. 65,498
Term of patent 14 years
U.S. Cl. D24—17

316,146
COMBINED SHIPPING AND STORAGE CONTAINER FOR SYRINGES
John B. Payne, West Des Moines, Iowa, and David R. Jones, West Palm Beach, Fla., assignors to Diamond Scientific Company, Des Moines, Iowa
Filed May 12, 1988, Ser. No. 193,491
Term of patent 14 years
U.S. Cl. D24—31

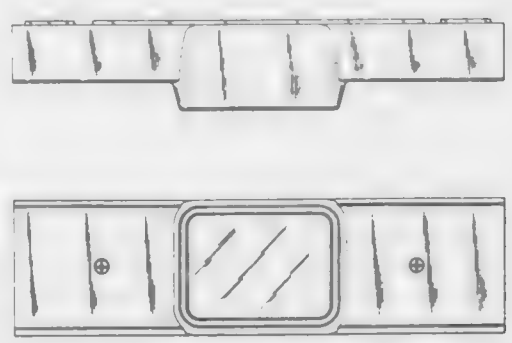
316,147
SANITARY NAPKIN
Serge Cadieux, Pierrefonds, Canada, assignor to Johnson & Johnson Inc., Montreal, Canada
Continuation of Ser. No. 242,267, Sep. 12, 1988, abandoned. This application Jul. 25, 1990, Ser. No. 560,459
Term of patent 14 years
U.S. Cl. D24—51

316,148
SANITARY NAPKIN
Serge Cadieux, Pierrefonds, Canada, assignor to Johnson & Johnson Inc., Montreal, Canada
Continuation of Ser. No. 242,268, Sep. 12, 1988, abandoned. This application Jul. 25, 1990, Ser. No. 560,457
Term of patent 14 years
U.S. Cl. D24—51

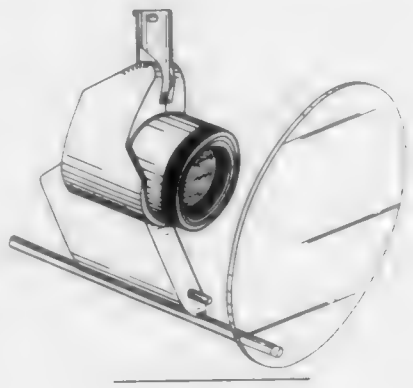


316,149
MALE GARMENT FOR ATTACHING A DISPOSABLE URINE COLLECTING RECEPTACLE
Anna M. Johnson, 37331 Park Ave., Willoughby, Ohio 44094
Filed Mar. 2, 1988, Ser. No. 162,862
Term of patent 14 years
U.S. Cl. D24—54

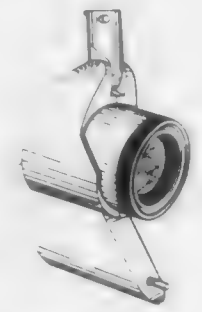
316,150
ORTHOTIC ANKLE FLEXURE
Bruce M. Day, Scandia, and Gene R. Berglund, Mahtomedi, both of Minn., assignors to Gillette Children's Hospital Association, St. Paul, Minn.
Filed Jan. 22, 1988, Ser. No. 147,154
Term of patent 14 years
U.S. Cl. D24—64



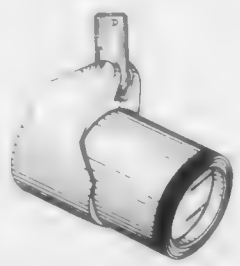
316,151
EXTENSION PANEL
Charles Heidmann, Strasbourg, France, assignor to Steelcase Strafor, Strasbourg, France
Filed Feb. 22, 1989, Ser. No. 314,421
Claims priority, application France, Aug. 30, 1988, 885 495
Term of patent 14 years
U.S. Cl. D25—138



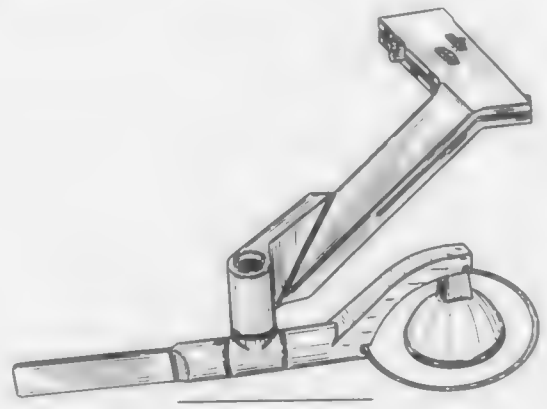
316,152
OIL LAMP
David Barbuto, Rte. 3, P.O. Box 1143, Tilton, N.H. 03726
Filed Nov. 17, 1986, Ser. No. 931,420
Term of patent 14 years
U.S. Cl. D26—11



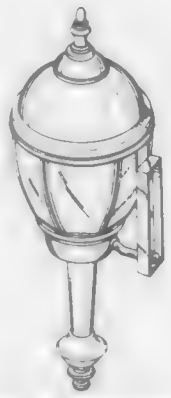
316,153
VEHICLE MOUNTED STROBE LIGHT FOR EMITTING LIGHT SIGNALS FOR THE CONTROL OF TRAFFIC LIGHTS
Harold W. Lyons, Killingworth, Conn., assignor to Minnesota Mining & Manufacturing Co., St. Paul, Minn.
Filed Oct. 13, 1988, Ser. No. 257,294
Term of patent 14 years
U.S. Cl. D26—28



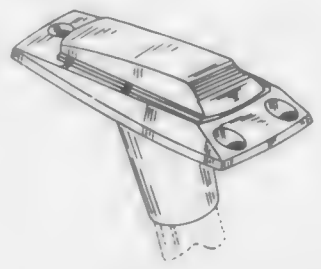
316,154
SPOTLIGHT
Bruno Gecchelin, Milan, Italy, assignor to Iguzzini Illuminazione S.p.A., Recanati, Italy
Filed Mar. 7, 1988, Ser. No. 164,628
Claims priority, application Italy, Sep. 15, 1987, 22337/87[U]
Term of patent 14 years
U.S. Cl. D26—63



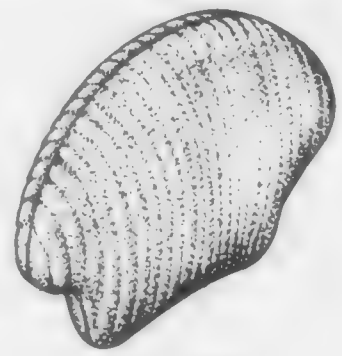
316,155
SPOTLIGHT
Bruno Gecchelin, Milan, Italy, assignor to Iguzzini Illuminazione S.p.A., Recanati, Italy
Filed Mar. 7, 1988, Ser. No. 164,632
Claims priority, application Italy, Sep. 15, 1987, 22337/87[U]
Term of patent 14 years
U.S. Cl. D26—63



316,156
SPOTLIGHT
Bruno Gecchelin, Milan, Italy, assignor to Iguzzini Illuminazione S.p.A., Recanati, Italy
Filed Mar. 7, 1988, Ser. No. 164,981
Claims priority, application Italy, Sep. 15, 1987, 22337/87[U]
Term of patent 14 years
U.S. Cl. D26—63

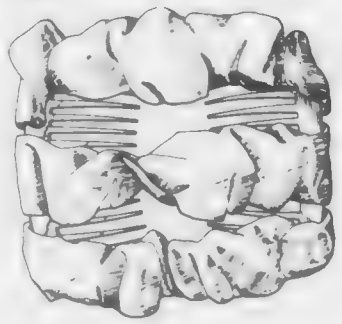


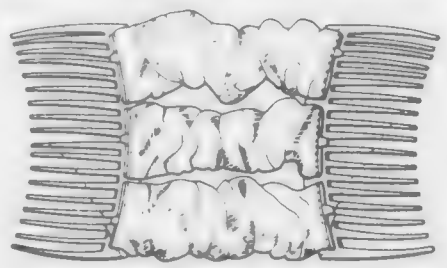
316,157
ADJUSTABLE INTERIOR LIGHTING FIXTURE
Richard Sapper, Montagnola, Switzerland, assignor to Artemide Litech S.p.A., Pregnana Milanese, Italy
Filed Apr. 29, 1988, Ser. No. 188,511
Claims priority, application Italy, Oct. 30, 1987, 53779/87[U]
Term of patent 14 years
U.S. Cl. D26—63



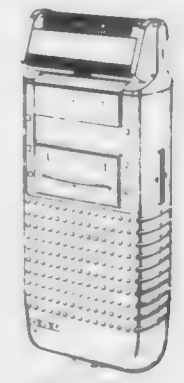
316,158
WALL MOUNTABLE LANTERN
Young J. Choi, Jugong Apt. 403-701, Dunchon-dong, Kangdong-ku, Seoul, Rep. of Korea
Filed Dec. 14, 1988, Ser. No. 284,112
Claims priority, application Rep. of Korea, Nov. 17, 1988, 15452
Term of patent 14 years
U.S. Cl. D26—87

316,159
SUPPORT BASE FOR BOAT LIGHT POLE
Warwick M. Whitley, II, Panama City, Fla., assignor to Attwood Corporation, Lowell, Mich.
Filed Nov. 23, 1988, Ser. No. 275,542
Term of patent 14 years
U.S. Cl. D26—142

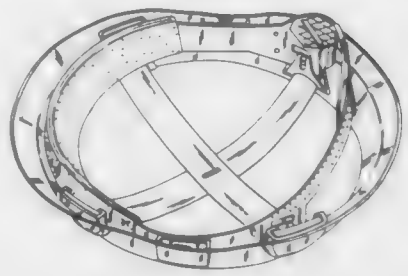




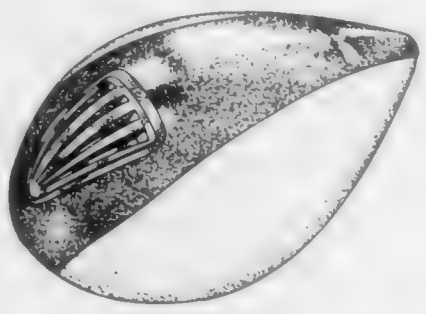
316,160
GELATIN CAPSULE
Gregory A. Schurig, Clearwater, Fla., and Joseph M. Bortolotti, Windsor, Canada, assignors to R. P. Scherer Corporation, Clearwater, Fla.
Filed Sep. 22, 1989, Ser. No. 410,968
Term of patent 14 years
U.S. Cl. D28—1



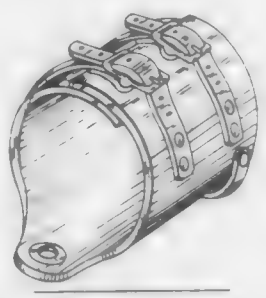
316,161
COMBINATION HAIR ORNAMENT AND RETAINING COMBS
Francesca B. Kuglen, 3744-14th Ave., Oakland, Calif. 94602
Filed Jul. 28, 1988, Ser. No. 225,727
Term of patent 14 years
U.S. Cl. D28—41



316,162
ELECTRIC DRY SHAVER
Roland Ullmann, Offenbach-Rumpenheim, Fed. Rep. of Germany, assignor to Braun Aktiengesellschaft, Kronberg, Fed. Rep. of Germany
Filed Nov. 16, 1987, Ser. No. 121,773
Claims priority, application Fed. Rep. of Germany, May 27, 1987, 73 MR 9586
The portion of the term of this patent subsequent to Dec. 18, 2004, has been disclaimed.
Term of patent 14 years
U.S. Cl. D28—49

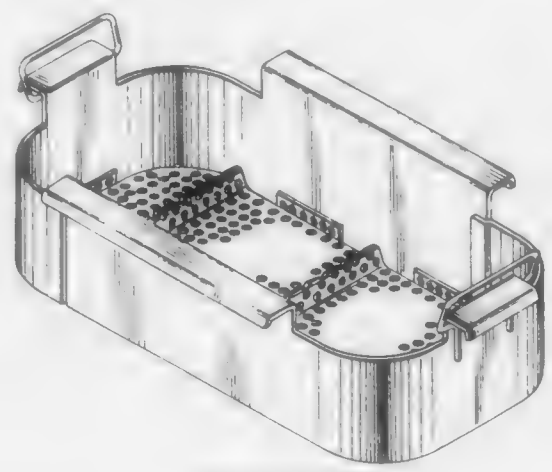


316,163
DENTAL FLOSSER
Charles A. Brewer, 105 Via Waznier, Newport Beach, Calif. 92660
Filed Aug. 24, 1988, Ser. No. 236,045
Term of patent 14 years
U.S. Cl. D28—64

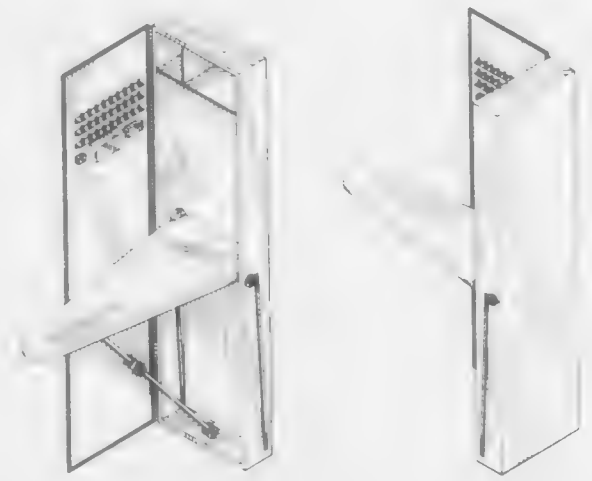


316,164
HOLDER FOR FACE VISOR, HEARING PROTECTOR AND SIMILAR EQUIPMENT
Rupert Fürthbauer, Lichtensteig, Switzerland, and Leif Palmaer, Kristinagatan 14, S-331 00 Värnamo, Sweden, assignors to Optrel AG, Switzerland and Leif Palmaer, Sweden
Filed Apr. 14, 1988, Ser. No. 182,074
Claims priority, application Sweden, Oct. 14, 1987, 872287
Term of patent 14 years
U.S. Cl. D29—12

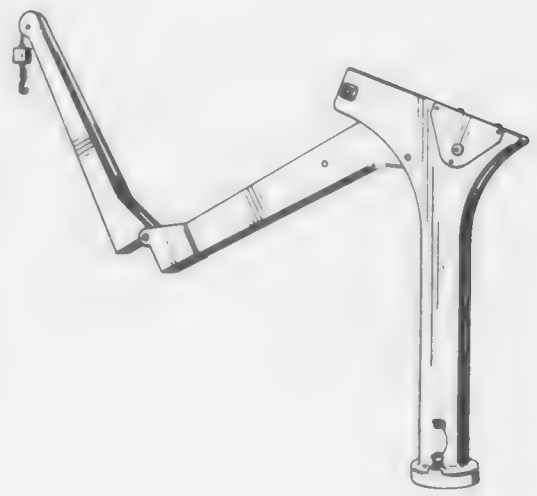
316,165
BICYCLE RACING HELMET
James J. Gentes, Soquel, and Steven K. Sasaki, Santa Cruz, both of Calif., assignors to Giro Sport Design, Inc., Soquel, Calif.
Filed Jun. 28, 1988, Ser. No. 212,857
Term of patent 14 years
U.S. Cl. D29—12



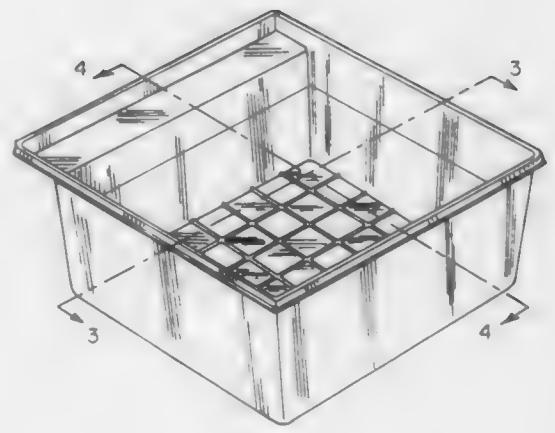
316,166
WRIST STRAP FOR ARROW RELEASE
Steven W. Fullmer, 502 Wagner Creek Rd., Talent, Oreg. 97540
Filed Mar. 2, 1987, Ser. No. 20,654
Term of patent 14 years
U.S. Cl. D29—20



316,167
VACUUM CLEANER
Salvatore Petralia, Sayreville, and H. Gerald Young, South Plainfield, both of N.J., assignors to TRC Acquisition Corporation, Atlanta, Ga.
Continuation-in-part of Ser. No. 836,468, Feb. 19, 1986, Pat. No. D 301,784. This application Oct. 31, 1988, Ser. No. 265,429
Term of patent 14 years
U.S. Cl. D32—22



316,168
TRAY UNIT FOR AN ULTRASONIC CLEANING MACHINE
Alan Miller, New York, N.Y., assignor to Ipco Corp., White Plains, N.Y.
Filed Dec. 20, 1988, Ser. No. 287,993
Term of patent 14 years
U.S. Cl. D32—25



316,169
COMBINED IRONING BOARD AND CABINET THEREFOR
Glen Bryan, and Elenora Bryan, both of 4603 W. Main St., Rapid City, S. Dak. 57702
Filed Feb. 25, 1988, Ser. No. 160,108
Term of patent 14 years
U.S. Cl. D32—66

316,170
FOLDING DAVIT
James G. Lomax, P.O. Box 317 Waters Runaway Bay, Queensland, Australia 4216
Filed Jan. 24, 1989, Ser. No. 301,259
Term of patent 14 years
U.S. Cl. D34—33

316,171
PAINT RECEPTACLE
Richard W. Chatham, Greensboro, and Charles W. Walker, Stoneville, both of N.C., assignors to Tru-Blu Products, Greensboro, N.C.
Filed Feb. 15, 1989, Ser. No. 311,578
Term of patent 14 years
U.S. Cl. D34—40

LIST OF PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 9TH DAY OF APRIL, 1991

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

See—
Rippingale, John B., Upton, Charles R.; Schonstedt, Erick O.; Osman, Bradley L. and . 5,006,806, Cl. 324-326.000.
Shaw, Ronald D.; Shaw, Leory E., Shaw, Lee A.; and . 5,005,331, Cl. 52-396.000.
Tucek, Miroslav; and . 5,005,377, Cl. 62-374.000.

A. O. Smith Corporation. *See*—
King, James L., and Lykes, Robert E., 5,006,743, Cl. 310-89.000.

A/S Niro Atomizer. *See*—
Jensen, Jens P., 5,006,204, Cl. 159-3.000.

AB Asea-Atom. *See*—
Jonsson, Erik, and Tornblom, Lars, 5,006,300, Cl. 376-203.000.

Abandaco, Inc.. *See*—
Blackburn, William A.; and Sosnowich, Michael P., 5,005,216, Cl. 2-79.000.

Abbott Laboratories. *See*—
Bouma, Stanley R., Blecka, Lawrence J., and Miller, Philip, 5,006,473, Cl. 436-516.000.
Gattaz, Wagner F., 5,006,462, Cl. 435-7.400.
Jordan, Willie W., 5,005,721, Cl. 220-23.400.
Khalil, Omar S., Hanna, Charles F., Zurek, Thomas F.; and Grigalauski, Denise A., 5,006,309, Cl. 422-56.000.

Abe, Mitsutaka. *See*—
Nishizawa, Kazunori, Abe, Mitsutaka; Matsumoto, Hiroshi; and Imamura, Shinji, 5,005,249, Cl. 15-250.270.

Abe, Takao. *See*—
Nakano, Masami, and Abe, Takao, 5,007,071, Cl. 378-74.000.

Ace Company, Inc. *See*—
Jensen, Raliegh J., 5,005,619, Cl. 144-230.000.

Achille, Felix, Stevens, Brad, and Clingerman, George, to Dow Chemical Company, The. Polymeric blend and laminated structures prepared therefrom. 5,006,383, Cl. 428-35.900.

Acker, Loren C.; and Harmony, Daniel C., to Engineering & Research Associates, Inc. Hollow core coaxial catheter. 5,006,119, Cl. 606-27.000.

Ackeret, Walter, to Rieter Machine Works, Ltd. Comber with electric motor driven intermittent feed roller. 5,005,262, Cl. 19-234.000.

Ackerman, Michael. *See*—
Ryan, Kyle A., Ackerman, Michael; Hale, Bruce; and Payne, Ward, 5,005,839, Cl. 273-240.000.

A'Costa, Anthony. Flash suppressor for firearms. 5,005,463, Cl. 89-14.200.

Acton, Elizabeth; Cargill, Alexander M., Ross, Colin F., and Eatwell, Graham P., to Rolls-Royce plc. Active control of unsteady motion phenomena in turbomachinery. 5,005,353, Cl. 60-39.281.

Acuna, Eduardo M. Apparatuses and methods for liquid-undissolved-solids separation. 5,006,264, Cl. 210-741.000.

Acushnet Company. *See*—
Brown, Robert A., and Wu, Shenshen, 5,006,297, Cl. 264-234.000.

Adachi, Takeshi; Mizuno, Kotaro; Yamada, Shigeru; Suzuki, Hideo; and Kimpara, Mamoru, to Yamaha Corporation. Musical tone visualizing apparatus which displays an image of an animated object in accordance with a musical performance. 5,005,459, Cl. 84-453.000.

Adamic, Raymond J., to Hewlett-Packard Company. Fixation of reactive dyes to paper by ink-jet printing. 5,006,862, Cl. 346-1.100.

Adams, Linda J., and O'Neill, George J., to Eastman Kodak Company. Water-dispersible polyesters imparting improved water resistance properties to inks. 5,006,598, Cl. 524-601.000.

Adamski, Joseph R.. *See*—
Clawson, Lawrence G., and Adamski, Joseph R., 5,005,383, Cl. 68-133.000.

Adapt Engineering Pty. Limited. *See*—
Gerardis, Patrick, and Tester, John, 5,005,502, Cl. 112-141.000.

Addax, Inc. *See*—
Wayne, Kenneth P.; and Werb, Jay P., 5,006,983, Cl. 364-401.000.

Adelman, John P., Bond, Chris T., Nilaver, Gajanan, and Zimmerman, Earl A., to Oregon Health Sciences University. Vectors and host cells expressing prepromotilin and motilin-associated peptide (MAP). 5,006,469, Cl. 435-240.100.

Adelson, Alexander, to Intec Corp. Flaw annunciator with a controllable display means for an automatic inspection system. 5,006,722, Cl. 250-563.000.

ADEV Gesellschaft fur Entwicklung und Vertrieb von medizintechnishen Artikeln mbH. *See*—
Grundei, Jaana, and Timmermann, Andreas, 5,005,564, Cl. 128-75.000.

Adolfsen, Pekka. *See*—
Alasaarela, Esko, Adolfsen, Pekka, and Rahkonen, Timo, 5,007,091, Cl. 381-26.000.

Adria Limited. *See*—
Moss, Stanley H., 5,005,381, Cl. 66-149.00S.

Advanced Composite Materials Corporation. *See*—
Jackson, Michael B.; and Roth, Peter A., 5,006,417, Cl. 428-614.000.

Advanced Micro Devices, Inc.. *See*—
Disko, David, 5,006,919, Cl. 357-72.000.
Dujari, Vineet, 5,007,012, Cl. 364-900.000.

Advanced Sleep Products. *See*—
Luchonok, Jeffrey J., 5,005,237, Cl. 5-451.000.

Advanced Technology Materials, Inc.. *See*—
Beetz, Charles P., Jr., 5,006,914, Cl. 357-61.000.

AEC, Inc.. *See*—
Dziedzic, Joseph H., Jr.; Rubino, Daniel A.; and Schaeffer, Raymond J., 5,006,019, Cl. 406-152.000.

AEG Aktiengesellschaft. *See*—
Bohm, Harald; Jutting, Wolfgang; and Bretting, Jork, 5,006,427, Cl. 429-101.000.

AEG Olympia Office GmbH. *See*—
Bruns, Ewald, and Bruns, Rolf, 5,005,995, Cl. 400-144.200.

AEG Westinghouse Transportation Systems, Inc.. *See*—
Rush, Donald L.; and May, Norman W., 5,006,847, Cl. 340-994.000.

Aehnelt, Hans-Peter; and Wirth, Michael, to Carl-Zeiss-Stiftung, Heidenheim/Brenz. Probe head of the switching type. 5,005,297, Cl. 33-559.000.

Aerospatiale Societe Nationale Industrielle. *See*—
Sibilo, Gerard, and Louis, Michel, 5,005,947, Cl. 350-252.000.

Agfa-Gevaert Aktiengesellschaft. *See*—
Berthold, Werner; and Ohlschlager, Hans, 5,006,440, Cl. 430-429.000.
Patzold, Walter; and Kampfer, Helmut, 5,006,455, Cl. 430-571.000.
Wermicke, Ubbo; and Mitzinger, Herbert, 5,006,439, Cl. 430-379.000.

Agrawal, Rakesh; and Woodward, Donald W., to Air Products and Chemicals, Inc. Nitrogen generator with dual reboiler/condensers in the low pressure distillation column. 5,006,137, Cl. 62-11.000.

Agrawal, Rakesh, and Woodward, Donald W., to Air Products and Chemicals, Inc. Cryogenic air separation process for the production of nitrogen. 5,006,139, Cl. 62-24.000.

Aida, Kazuo; Nishi, Shigendo, and Nakagawa, Kiyoshi, to Nippon Telegraph and Telephone Corporation. Optical branching equipment and optical network using the same. 5,005,937, Cl. 350-96.160.

Aiello, Robert P., Riley, Michael J., and Millay, Herbert D., to Shell Oil Company. Gasoline composition for reducing intake valve deposits in port fuel injected engines. 5,006,130, Cl. 44-432.000.

Aime, Michel; and Sager, Edmund, to Inventio AG. Apparatus for damping oscillations in elevator cars. 5,005,671, Cl. 187-1.00R.

Air Products and Chemical, Inc.. *See*—
Parks, David L., Jr., and Martin, Carl J., 5,006,325, Cl. 423-390.000.

Air Products and Chemicals, Inc.. *See*—
Agrawal, Rakesh, and Woodward, Donald W., 5,006,137, Cl. 62-11.000.
Agrawal, Rakesh; and Woodward, Donald W., 5,006,139, Cl. 62-24.000.
Chen, Michael S. K.; Painter, Corning F., Pastore, Steven P.; Roth, Gary; and Winchester, David C., 5,006,141, Cl. 65-27.000.
DiMartino, Stephen P., Sr.; and Sorensen, James C., 5,006,132, Cl. 55-16.000.
Garg, Diwakar; Wrecsics, Ernest L., Schaffer, Leslie E.; Mueller, Carl F., Dyer, Paul N., and Fabregas, Keith R., 5,006,371, Cl. 427-249.000.
Maroulis, Peter J.; Clark, Patrick J., Morris, Victoria J.; Byerley, Robert A., and Booker, John, 5,006,315, Cl. 422-89.000.

Aisin AW Co., Ltd. *See*—
Kimura, Hiromichi, Iwatsuki, Kunihiro, Taniguchi, Hiroji, Taniguchi, Takuji, and Ishikawa, Kazunori, 5,005,444, Cl. 74-868.000.
Sakakibara, Shiro, Imai, Norio, Kondo, Hidehiro, and Kamiya, Kazuo, 5,005,442, Cl. 74-866.000.
Takase, Isao; Takemoto, Haruki, Tatsuta, Mitsugu, Maseki, Shinobu; Kano, Takenori, Yokoyama, Fumitomo, and Niimi, Mamoru, 5,006,102, Cl. 475-282.000.

Aisin Seiki Kabushiki Kaisha. *See*—
Fukumoto, Ryoichi, Hayakawa, Shigeru, and Torii, Nozomu, 5,005,882, Cl. 292-216.000.
Kazaoka, Kenichi; and Okazaki, Hiroshi, 5,006,052, Cl. 418-61.100.
Momose, Yutaka, Watanabe, Tetsumi, and Yamaguro, Akira, 5,005,349, Cl. 60-517.000.

Akagi, Toshimichi. *See*—
Tashima, Seiji; Okimoto, Haruo, Akagi, Toshimichi, and Niwa, Yasushi, 5,005,359, Cl. 60-600.000.

Akahide, Kohzo. *See*—
Fujita, Tsutomu, Imura, Hidetoshi; and Akahide, Kohzo, 5,006,687, Cl. 219-121.590.

Akamine, Hiroshi, and Sato, Yoshinori. Halogen-containing resin composition. 5,006,579, Cl. 524-238.000.

Akasaki, Yutaka, Aonuma, Hidekazu, Hongo, Kazuya, Sato, Katsuhiro, Nukada, Katsumi, and Marumo, Teruumi, to Fuji Xerox Co., Ltd. Electrophotographic photosensitive member with additive in charge generating layer 5,006,435, Cl. 430-58.000

Akkumulatorenfabrik Dr. Leopold Jungfer *See*—
Frey, Helmut, 5,006,040, Cl. 414-789.900

Alasaarela, Esko, Adolfsen, Pekka, and Rahkonen, Timo, to UTK Uuden Teknologian Keskus Oy. Procedure and device for facilitating audiovisual observation of a distant object 5,007,091, Cl. 381-26.000

Albany International Corporation *See*—
Davenport, Francis L., 5,005,610, Cl. 139-383.0AA

Albert-Frankenthal AG *See*—
Kobler, Norbert, and Puschnerat, Helmut, 5,005,476, Cl. 101-363.000

Albert, Guy D., and Beaty, Robert C., to Alcatel NA Network Systems Corp. Lock handle for printed wiring board assemblies and the like 5,006,951, Cl. 361-220.000

Albest Metal Stamping Corporation *See*—
Hirsch, Nathan A., 5,005,269, Cl. 24-668.000

Albrecht, Ernst, and Dinges, Harald, to G. M. Pfaff Aktiengesellschaft Thread cutting device having a translatably slidable knife and catcher, being driven for forming uniformly short stitch thread ends in a zig zag sewing machine 5,005,504, Cl. 112-292.000

Alcatel NA Network Systems Corp. *See*—
Albert, Guy D., and Beaty, Robert C., 5,006,951, Cl. 361-220.000

Alcatel N.V. *See*—
Chesnoy, Jose, 5,007,062, Cl. 372-26.000

Alexandru, Lupu *See*—
Schwarz, William M., Marchessault, Robert H., Alexandru, Lupu, and Henrissat, Bernard, 5,006,170, Cl. 106-20.000

Alfred Teves GmbH *See*—
Boehm, Peter, Jakobi, Ralf, and Bauer, Jurgen, 5,005,465, Cl. 91-369.100
Reinartz, Hans-Dieter, Steffes, Helmut, Von Hayn, Holger, and Meier, Thomas, 5,005,350, Cl. 60-562.000
Schiel, Lothar, and Rueffer, Manfred, 5,005,918, Cl. 303-114.000

Ali, Syed *See*—
Kazerounian, Reza, Ali, Syed, and Eitan, Boaz, 5,006,974, Cl. 363-60.000

Alikhan, Mir I., Colrud, Sandra M., and Sneyd, James C., to Kimberly-Clark Corporation Tampon with single layer powder bonded wrap 5,006,116, Cl. 604-365.000

Allebach, Gene E. *See*—
Hite, William H., and Allebach, Gene E., 5,005,397, Cl. 72-405.000

Allen, Richard C. *See*—
Hamer, R. Richard L., Freed, Brian, and Allen, Richard C., 5,006,563, Cl. 514-646.000

Allergan, Inc. *See*—
Chandraratna, Roshantha A. S., 5,006,550, Cl. 514-456.000

Allied-Signal *See*—
Elsenbaumer, Ronald L., 5,006,278, Cl. 427-385.500
Kavesh, Sheldon, Kim, Kwang, Kwon, Young D., and Prevorsek, Dusan C., 5,006,390, Cl. 428-105.000

Allied-Signal Inc. *See*—
Andersen, Blaine W., and Tervo, John N., 5,005,804, Cl. 251-215.000
Draskovich, Barry S., 5,006,423, Cl. 428-698.000
Green, George D., Munk, Stephen A., and Barnes, Darryl K., 5,006,408, Cl. 428-395.000

Allina, Edward F. Electrical transient surge protection with parallel means. 5,006,950, Cl. 361-117.000

Alloy Engineering Company *See*—
Freund, William P., 5,006,064, Cl. 432-205.000

Alpcan SA *See*—
Fister, Christian, and Grasset, Yves, 5,005,266, Cl. 24-601.500

Alpine Electronics Inc. *See*—
Otsuki, Akira, 5,006,941, Cl. 360-96.200

Altech Co., Ltd. *See*—
Yokoyama, Naoomi, 5,006,186, Cl. 156-211.000

Alza Corporation *See*—
Edgren, David E., and Theeuwes, Felix, 5,006,346, Cl. 424-473.000

Amada Company, Limited *See*—
Sartorio, Franco, Grassi, Fabrizio, Prunotto, Gianpaolo, and Sgandurra, Francesco, 5,005,394, Cl. 72-310.000

Amano, Yoshikazu *See*—
Kato, Keiko, Kageyama, Shigeki, Amano, Yoshikazu, Arai, Fuminori, and Katsuyama, Harumi, 5,006,458, Cl. 435-4.000

American Combustion, Inc. *See*—
Gitman, Gregory M., 5,005,493, Cl. 110-246.000

American Communications & Engineering, Inc. *See*—
Masson, Ronald K., and Edelson, Michael W., 5,007,078, Cl. 379-75.000

American Cyanamid Company *See*—
Forgione, Peter S., and Singh, Balwant, 5,006,653, Cl. 544-196.000

American Institute of Taxidermy, Inc. *See*—
Rinehart, John R., 5,005,310, Cl. 43-17.000

American National Can *See*—
Genske, Roger P., 5,006,384, Cl. 428-36.700.

American Standard Inc. *See*—
Basile, Peter A., Madan, Ashvani K., Snyder, Fred E., and Stillman, Harold M., 5,005,226, Cl. 4-354.000
Hart, James E., and McKay, Albert A., 5,005,915, Cl. 303-22.200

Amis, Lynn F., and Gee, Daniel R., to Convoy Security Company. Sequential seal 5,006,697, Cl. 235-91.00R

Ammermann, Eberhard *See*—
Seele, Rainer, Kober, Reiner, Karbach, Stefan, Sauter, Hubert, Ammermann, Eberhard, Lorenz, Gisela, Rademacher, Wilhelm, and Jung, Johann, 5,006,152, Cl. 71-92.000

Ammonia Casale S.A. *See*—
Zardi, Umberto, and Pagani, Giorgio, 5,006,316, Cl. 422-148.000

Amoco Corporation *See*—
Fielding, Ivor R., 5,006,587, Cl. 524-405.000

AMP Incorporated *See*—
Counsel, Eugene F., and Werner, Walter M., 5,006,081, Cl. 439-783.000
Dery, Ronald A., Deak, Frederick R., and Zimmerman, Richard H., 5,006,286, Cl. 264-40.200
Loose, Winfield W., Robertson, James W., and Shay, Francis J., 5,006,077, Cl. 439-409.000

Amundson, Eric K., and Manners, Herbert C. Retrofittable sewer trap 5,005,603, Cl. 137-192.000

Andersen, Blaine W., and Tervo, John N., to Allied-Signal Inc. Balanced-torque butterfly valve 5,005,804, Cl. 251-215.000

Anderson, Alfred J. *See*—
Koehler, Harold W., Anderson, Alfred J., and Finelli, Alfred A., 5,005,731, Cl. 222-54.000

Anderson, Charles C., Kestner, Diane E., Lewis, Mark A., and Opitz, Gary R., to Eastman Kodak Company. Photographic support material comprising an antistatic layer and a barrier layer 5,006,451, Cl. 430-527.000

Anderson, Dirk M., Baker, Paul E., Cantrell, Michael A., Cerretti, Douglas P., Cosman, David J., Gimpel, Steven D., Grabstein, Kenneth H., Larsen, Alf D., and McKereghan, Kate N. Process for preparing bovine interleukin-2 5,006,465, Cl. 435-69.520

Anderson, Donn R., to Minnesota Mining & Manufacturing Company. Form used for ordering custom printed products 5,005,871, Cl. 283-61.000

Anderson, Eddy. Extensible and retractable step assembly 5,005,667, Cl. 182-15.000

Anderson, Forrest L. Three dimensional imaging device using ellipsoidal backprojection 5,005,418, Cl. 73-625.000

Anderson, Janet Y. *See*—
Bern, Barbara J., and Anderson, Janet Y., 5,005,217, Cl. 2-104.000

Anderson, John M. to General Electric Company. Luminaire for an electrodeless high intensity discharge lamp with electromagnetic interference shielding 5,006,763, Cl. 315-248.000

Anderson, Larry D., to Asten Group, Inc. Split heddle with superimposed blades with aligned apertures 5,005,608, Cl. 139-93.000

Anderson, Marc A., and Xu, Qunyin, to Wisconsin Alumni Research Foundation. Metal oxide porous ceramic membranes with small pore sizes 5,006,248, Cl. 210-500.250

Anderson, Richard J. *See*—
Lee, Shy-Fuh, Anderson, Richard J., Luehr, Gary W., and Scott, Carole R., 5,006,150, Cl. 71-88.000

Anderson, Thomas A., Kalar, Richard G., Markfelt, Reinhold S., and Wagner, Walter R., to Johnson Filtration Systems Inc. Mounting system for increasing the wear life of a vibrating screen panel 5,006,228, Cl. 209-365.300

Anderson, Vernon B. *See*—
Ong, Helen H., Anderson, Vernon B., and Profitt, James A., 5,006,664, Cl. 549-12.000

Andersson, Kjell, and Eriksson, Lennart, to ASE Europe AB. Method for determining the specific fuel consumption of an internal combustion engine and apparatus therefor 5,006,994, Cl. 364-442.000

Anderzen, Gert A. *See*—
Sandvik, Lars V., and Anderzen, Gert A., 5,005,867, Cl. 280-804.000

Andoh, Kazuto *See*—
Morigaki, Masakazu, Ishikawa, Takatoshi, Andoh, Kazuto, Seto, Nobuo, Koshimizu, Toshio, and Ueda, Shinji, 5,006,456, Cl. 430-372.000

Andreas, David W. *See*—
Watkins, James D., Andreas, David W., and Cox, David H., 5,006,405, Cl. 428-323.000

Andress, Harry J., Horodysky, Andrew G., and Kaminski, Joan M., to Mobil Oil Corporation. Friction reducing additives and compositions thereof 5,006,272, Cl. 252-49.600

Andryszak, Kenneth R. *See*—
Benn, Raymond C., Davidson, Jeffrey M., and Andryszak, Kenneth R., 5,006,163, Cl. 75-229.000

Angelchik, Jean P. Apparatus and method for laparoscopic implantation of anti-reflux prosthesis 5,006,106, Cl. 600-37.000

Angerbauer, Rolf, Fey, Peter, Hubsch, Walter, Philipps, Thomas, Bischoff, Hilmar, Petzinna, Dieter, Schmidt, Delf, and Thomas, Gunter, to Bayer Aktiengesellschaft. Certain 7-[2,6-diisopropyl-4-phenyl-5-lower alkoxymethyl-pyrid-3-yl]-3,5-dihydroxy-6-enoates and derivatives useful for treating circulatory diseases. 5,006,530, Cl. 514-277.000

Anma, Sadayuki *See*—
Kudoh, Kazuhiro, Nishiyama, Toshirou, and Anma, Sadayuki, 5,007,105, Cl. 455-344.000

Annan, Robert K. *See*—
Woo, Kenneth J., and Annan, Robert K., 5,005,485, Cl. 102-531.000.

Anstey, Henry D., to Deere & Company. Mounting for the spiral flights at the opposite ends of a bale wrapping material spreader roll 5,005,747, Cl. 226-190.000.

Anthony, Donald R., and Williamson, George C., III, to Atlantic Richfield Company. Pipe insulation and corrosion protection system 5,006,185, Cl. 156-193.000

Antibioticos S.A. of Bravo Murillo 38 *See*—
Sanchez, Florentina S., Susan, Victor R., Carramolino-Fitera, Laura, and Ortega, Agustin P.A., 5,006,471, Cl. 435-254.000

Aoike, Tatsuyuki *See*—
Kanai, Masahiro, Aoike, Tatsuyuki, Matsuda, Koichi, and Kawakami, Soichiro, 5,006,180, Cl. 136-258.000.

Aoki Corporation *See*—
Tono, Show, Miki, Toshiyuki, Dairokuno, Yoshihide, and Kataoka, Jyun, 5,006,639, Cl. 210-727.000.

Aoki, Hiroshi *See*—
Sasamori, Kenzi, Yamamoto, Hiroshi, and Aoki, Hiroshi, 5,006,958, Cl. 361-335.000

Aoki, Masaki *See*—
Fujii, Eiji, Torii, Hideo, and Aoki, Masaki, 5,006,363, Cl. 427-39.000

Aomori, Kohkichi, to Kabushiki Kaisha Toshiba Endoscope 5,005,558, Cl. 128-4.000

Aonuma, Hidekazu *See*—
Akasaki, Yutaka, Aonuma, Hidekazu, Hongo, Kazuya, Sato, Katsuhiro, Nukada, Katsumi, and Marumo, Teruumi, 5,006,435, Cl. 430-58.000

Aoyama, Tomoo *See*—
Hatakeyama, Yasuhiko, and Aoyama, Tomoo, 5,007,005, Cl. 364-521.000

Aoyama, Yasutada *See*—
Imaizumi, Mamoru, and Aoyama, Yasutada, 5,007,002, Cl. 364-519.000

Apex Engineering Inc. *See*—
Draffen, Dale; Dunning, William E.; McGregor, Larry D.; Walker, Donald L., and Sisk, Harold R., 5,005,983, Cl. 366-340.000

Appalachian Technologies Corporation *See*—
Beverly, William C., II, Dalton, Michael B., and Gaddis, David Q., 5,006,790, Cl. 324-104.000

Atochem North America, Inc. *See*—
Hung, Paul L. K.; and Tseng, Kenneth K. S., 5,006,436, Cl. 430-284.000.

Atsuta, Mitsuru; Sakashita, Takeshi; Miyamoto, Ryoichi; Tanimura, Yukinori, and Fuji, Saburo, to Mitsui Petrochemical Industries, Ltd. Curable compositions for dental drugs having sustained release property. 5,006,340, Cl. 424-405.000

Attix, Frank H., to Radiation Measurements, Inc. Scintillator dosimetry probe. 5,006,714, Cl. 250-368.000

Atwal, Karnail, to E. R. Squibb & Sons, Inc. Antiarrhythmic agents. aryl cyanoguanidine potassium channel blockers. 5,006,523, Cl. 514-227.500.

Augat, Inc. *See*—
Thomas, Joseph, 5,006,680, Cl. 200-293.000.

Auksi, Gunnar, to R. R. Donnelley & Sons Company. Apparatus and method for individually printing signatures during delivery to a binding line conveyor. 5,005,815, Cl. 270-1.001.

Auld, Gregg D.: *See*—
Franklin, Richard D.; Auld, Gregg D., Murray, David E., Lescisin, John J., Vaia, Albert R.; and Dunn, Thomas E., 5,006,304, Cl. 376-316.000.

Aurelle, Yves: *See*—
Roques, Henri, Aurelle, Yves; and Lopez, Louis, 5,006,260, Cl. 210-708.000.

Austad, Eric D. Self-inflating tissue expander. 5,005,591, Cl 128-899.000.

Avery, Noyes L.; Benjamin, Linda A.; Horodysky, Andrew G.; and Law, Derek A., to Mobil Oil Corporation. Organosulfur adducts as multifunctional additives for lubricating oils and fuels and as multifunctional lubricants. 5,006,271, Cl. 252-45.000.

Avibank Mfg., Inc.: *See*—
Duran, John A., 5,006,025, Cl. 411-183.000.

Ayanoglu, Ender; Gitlin, Richard D., I, Chih-Lin; and Mazo, James E., to AT&T Bell Laboratories. Diversity coding for transparent self-healing communications networks. 5,007,067, Cl. 375-40.000.

Ayata, Naoki, Shirato, Yoshiaki; Takaton, Yasushi, and Seki, Mitsuaki, to Canon Kabushiki Kaisha. Information read-out and recording apparatus. 5,006,864, Cl. 346-33.00R.

Aylott, David H., to Eylure Limited. Fingernail repair. 5,005,595, Cl. 132-73.000.

Azetsu, Akihiro, to Indata Systems Kabushiki Kaisha. Non-recovery parallel divider circuit. 5,007,009, Cl. 364-764.000.

Aziz, Sultan: *See*—
Kreutner, William; Bolser, Donald; Chapman, Richard; and Aziz, Sultan, 5,006,560, Cl. 514-114.000.

Azuma, Yoshihiko *See*—
Katoh, Takehiro; Azuma, Yoshihiko; Hirano, Masayasu; Kageyama, Naohiro; Ishimura, Toshihiko; Tsuji, Kenji, and Ootsuka, Hiroshi, 5,006,877, Cl. 354-412.000.

B. F. Goodrich Company, The: *See*—
Sharaby, Zaev; and Vielhaber, Robert G., 5,006,607, Cl. 525-356.000.

B & G Plastics, Inc.: *See*—
Kolton, Chester; and Spater, Stuart S., 5,005,741, Cl. 223-85.000

B-Line Systems, Inc.: *See*—
Rinderer, Eric R., 5,005,792, Cl. 248-205.100.

Baarman, David W.; and Richards, David M., to Astro, Inc. Apparatus and method for effecting data compression. 5,006,849, Cl. 341-95.000.

Babanezhad, Joseph N., to Sierra Semiconductor. Rail-to-rail CMOS operational amplifier. 5,006,817, Cl. 330-253.000.

Bacehowski, David V.; Cullis, Herbert M.; and Van Baelen, Armand R., to Baxter International Inc. Disposable container for a centrifuge. 5,006,103, Cl. 494-45.000.

Bachel, Ernst; and Licker, Anton-Guenther, to Siemens Aktiengesellschaft. End member for a longitudinally divided cable sleeve. 5,006,669, Cl. 174-93.000.

Bachli, Emil. Heat-insulating building and/or light element. 5,005,557, Cl. 126-441.000.

Back, Peter B., Utlaut, Mark W.; and Clark, William M., Jr., to Hughes Aircraft Company. Ion evaporation source for tin. 5,006,715, Cl. 250-423.00R.

Backes, Johannes B.: *See*—
Tyrrell, Paul C.; Backes, Johannes B.; McCormick, David D., and Jesse, John F., 5,007,103, Cl. 219-363.000

Bagrodia, Shriram; and Phillips, Bobby M., to Eastman Kodak Company. Modified grooved polyester fibers and spinneret for production thereof. 5,006,057, Cl. 425-464.000.

Bahr, Craig B.: *See*—
Schutte, Marlin D.; Bahr, Craig B.; Weetman, Ronald J., and Howk, Richard A., 5,006,283, Cl. 261-93.000

Bailey, Kevin L.; and D'Hooge, Richard E., to Rixson-Firemark Inc. Door locking mechanism. 5,005,881, Cl. 297-45.000.

Bailey, Ronald F., to Rare Research. Meat hook. 5,005,257, Cl. 452-185.000.

Baiocchi, Paolo; and Iori, Giuseppe. Optical element used to reduce the image perception time. 5,006,409, Cl. 428-411.100

Baird, James C., to Procter & Gamble Company, The. Multilayer polymeric film. 5,006,394, Cl. 428-138.000.

Baker Hughes Incorporated: *See*—
Durham, Daniel K.; Conkle, Urban C.; and Downs, Hartley H., 5,006,274, Cl. 252-180.000.

Baker, Joffre B.: *See*—
Scott, Randy W.; and Baker, Joffre B., 5,006,252, Cl. 210-635.000.

Baker, Paul E.: *See*—
Anderson, Dirk M.; Baker, Paul E.; Cantrell, Michael A., Cerretti, Douglas P.; Cosman, David J.; Gimpel, Steven D., Grabstein, Kenneth H.; Larsen, Alf D.; and McKereghan, Kate N., 5,006,465, Cl. 435-69.520.

Baker, Robert K.; Pessolano, Arsenio A.; Rupprecht, Kathleen M.; and Durette, Philippe L., to Merck & Co. Inc., Inc. Derivatives of 3-hydroxyazabenzo(beta)thiophene useful as 5-lipoxygenase inhibitors. 5,006,532, Cl. 514-301.000.

Balasubramanian, Mannarsamy; Gluckstein, Martin E., and Hornbaker, Edwin D., to Ethyl Corporation. Process for preparing organosilazanes. 5,006,625, Cl. 528-14.000.

Baldi, Charles A., to International Telesystems Corp. Classification of audio signals on a telephone line. 5,007,000, Cl. 364-513.500.

Ballard, Donald E., Frischmann, Peter G., and Taub, Alan I., to General Electric Company. Hot shear cutting of amorphous alloy ribbon. 5,005,456, Cl. 83-170.000.

Ballu, Patrick J., to Tecnoma. Portable liquid sprayer, particularly for the treatment of plants. 5,005,440, Cl. 74-579.00R.

Ballweg, Achim: *See*—
Jennewein, Manfred A.; and Ballweg, Achim, 5,005,691, Cl 198-465.400.

Cooper, Graham P., and Jones, Reginald T., to Vickers PLC Method of forming a discontinuous covering layer on radiation sensitive devices 5,006,442, Cl. 430-168.000

Cooper Industries, Inc *See—*
McWhorter, David J., Williams, Bolie C., III, Childs, Eric G., and Schaeper, Gary R., 5,005,802, Cl. 251-1.300

Cooper, James L., to Waug Laboratories, Inc Squeezable computer control device 5,006,836, Cl. 340-710.000

Cooper, Paul F *See—*
Lidgitt, Peter J., Freeman, Derek J., and Cooper, Paul F., 5,006,232, Cl. 210-96.100

Cooper, Roydon B., to Pall Corporation Barrier flange filter assembly including cover 5,006,235, Cl. 210-136.000

Copytele, Inc *See—*
DiSanto, Frank J., Krusos, Denis A., and Schubert, Frederic E., 5,006,212, Cl. 204-192.140

Corcoran, Mark W *See—*
Katsumata, Shin, and Corcoran, Mark W., 5,006,043, Cl. 415-113.000

Cordera, Robert J., to Nabisco Brands, Inc Flowable material distribution sampling method and device 5,005,431, Cl. 73-863.530

Cording, Robert B *See—*
D'Aoust, Robert, Cording, Robert B., Grosse, Debora Y., Jennings, Kevin, Krebs, Stephen R., Reasoner, George E., Jr., Smith, Gerald R., and Williams, David C., 5,007,100, Cl. 382-49.000

Corel, Dale C., Tamosaitis, Anthony, and Narechania, Pradeep, to General Signal Corporation Three phase voltage regulator system using tertiary winding transformer 5,006,783, Cl. 323-263.000

Corley, Richard E., Jr *See—*
Arvanitakis, Nicolaos C., BLack, Vincent J., Corley, Richard E., Jr., Nolan, Richard G., and Olson, Leonard T., Jr., 5,005,939, Cl. 350-96.200

Cornell, Paul Modular cabinet support 5,005,848, Cl. 280-79.110.

Corso, Angela N., Corso, Angelo, Corso, Carlo, and Corso, Antonio, to Lubrimetal S p A Continuous process for preparing powder lubricants to use in dry wiredrawing and/or in cold metal rolling 5,006,269, Cl. 252-39.000

Corso, Angelo *See—*
Corso, Angela N., Corso, Angelo; Corso, Carlo, and Corso, Antonio, 5,006,269, Cl. 252-39.000

Corso, Antonio *See—*
Corso, Angela N., Corso, Angelo, Corso, Carlo, and Corso, Antonio, 5,006,269, Cl. 252-39.000

Corso, Carlo *See—*
Corso, Angela N., Corso, Angelo, Corso, Carlo; and Corso, Antonio, 5,006,269, Cl. 252-39.000

Cosman, David J. *See—*
Anderson, Dirk M., Baker, Paul E., Cantrell, Michael A., Cerretti, Douglas P., Cosman, David J., Gimpel, Steven D., Grabstein, Kenneth H., Larsen, Alf D., and McKereghan, Kate N., 5,006,465, Cl. 435-69.520

Costa, Larry J *See—*
Swanson, Dail L. and Costa, Larry J., 5,006,764, Cl. 315-276.000

Costa, Robert E *See—*
Granville, J. Michael, Costa, Robert E., and Chu, Sam Y., 5,006,846, Cl. 340-870.280

Cotrel, Yves, to Societe de Fabrication de Material Orthopedique Implant for spinal osteosynthesis device, in particular in traumatology 5,005,562, Cl. 128-69.000

Cottrell, Ian W *See—*
Smith, Terry E., Cho, James R., and Cottrell, Ian W., 5,006,595, Cl. 524-548.000

Counsel, Eugene F., and Werner, Walter M., to AMP Incorporated Electrical wire connector 5,006,081, Cl. 439-783.000

Cox, David H *See—*
Watkins, James D., Andreas, David W., and Cox, David H., 5,006,405, Cl. 428-323.000

Cox, James P Lipid pelletization methods, apparatus and products 5,006,361, Cl. 426-601.000

Craftmation, Inc *See—*
Evans, Owen C., 5,005,398, Cl. 72-450.000

Craig, James R., to Gendex Corporation Method and apparatus for obtaining a selectable contrast image in an X-ray film 5,007,073, Cl. 378-112.000

Crandall, Jerry A., Witta, James A., and Bower, Stuart S., to Navistar International Transportation Corp Jump start stud assembly 5,006,078, Cl. 439-521.000

Crawford, Carl R *See—*
O'Donnell, Matthew, Welles, Kenneth B., II, Crawford, Carl R., Pelc, Norbert J., and Karr, Steven G., 5,005,419, Cl. 73-626.000

Crawley, Clifton J. Jr *See—*
Schwarz, Fred M., Crawley, Clifton J., Jr., Rausco, Anthony, and Lagueux, Ken R., 5,005,352, Cl. 60-39.020

Creed, David M., Wilkinson, James H., and Lawlor, Robert J. D., to Sony Corporation Apparatus and method for separating a component of a composite digital video signal 5,006,927, Cl. 358-31.000

Croket, Frank M., to Halleo Fabricators, Inc Contaminant entrained flow separating apparatus 5,006,236, Cl. 210-162.000

Crombeen, Jacobus E *See—*
Hasker, Jan, Crombeen, Jacobus E., Niessen, Anton K., and Stoffelen, Henricus J. H., 5,006,753, Cl. 313-346.00R

Damiani, Vincenzo: *See*—
Ricco, Mario; Damiani, Vincenzo, and Picciallo, Michele, 5,005,404, Cl. 73-119.00A.
Danby, Clive M., to Sundstrand Corporation. Position monitor for a stepper motor. 5,006,772, Cl. 318-696.000.
Danick, Charles; and Panandiker, K. P., to Cargill, Incorporated. Polyesters for powder coating resins using an intermediate having low process viscosity. 5,006,612, Cl. 525-438.000.
Daniel Industries, Inc.: *See*—
Morris, Gene A.; Patel, Deepak C.; and Sternenberg, James E., 5,005,805, Cl. 251-229.000.
Danish Container Supply ApS: *See*—
Fossing, Michael; and Jensen, Bent T., 5,006,031, Cl. 414-458.000.
D'Annunzio, Joseph C., to Teledyne Industries, Inc. Erasable xerographic vellum. 5,006,389, Cl. 428-76.000.
D'Aoust, Robert; Cording, Robert B.; Grosse, Debora Y.; Jennings, Kevin; Krebs, Stephen R.; Reasoner, George E., Jr.; Smith, Gerald R.; and Williams, David C., to Unisys Corporation. Diagnostic system for a parallel pipelined image processing system. 5,007,100, Cl. 382-49.000.
Darnell, W. Ronald: *See*—
Jackson, Winston J., Jr.; Darnell, W. Ronald; Bell, Bruce C.; and Strand, Marc A., 5,006,628, Cl. 528-182.000.
Dausseing, Jean-Paul: *See*—
Fish, Aaron M.; Branover, Alexander; Dausseing, Jean-Paul; and Miresmaili, Masoud, 5,005,884, Cl. 292-336.300.
Davenport, Francis L., to Albany International Corporation. Papermaking fabric pin seam with braided yarns in joining loops. 5,005,610, Cl. 139-383.0AA.
Davidson, Bradley W: *See*—
Lewis, Thomas E.; Davidson, Bradley W.; Williams, Richard A.; Nowak, Michael T.; and Kline, John F., 5,005,479, Cl. 101-467.000.
Davidson, Jeffrey M.: *See*—
Benn, Raymond C.; Davidson, Jeffrey M.; and Andryszak, Kenneth R., 5,006,163, Cl. 75-229.000.
Davidson Textron Inc: *See*—
Kelman, Josh, 5,005,887, Cl. 293-120.000.
Rhodes, Richard D., Jr.; and Fredericks, W. David, 5,006,288, Cl. 264-46.600.
Davies, Robert B., to Motorola, Inc. Control circuit for rapid gate discharge. 5,006,736, Cl. 307-570.000.
Davis, Billy F.; Hancock, Michael P.; and Hayes, Scott L., to Goex, Inc. System for packaging detonating cord for transport. 5,005,694, Cl. 206-3.000.
Davis, Bruce W., to Chevron Research and Technology Company. Polydialkylsilalkylene polymer useful in enhanced oil recovery using carbon dioxide flooding. 5,006,584, Cl. 524-284.000.
Davis, Charles E. Method and apparatus for simplifying and improving consistency of color grading of gemstones. 5,005,971, Cl. 356-30.000.
Davis, Darrell E., to Motorola, Inc. BIMOS logic gates. 5,006,730, Cl. 307-446.000.
Davis, James C., to Standard Oil Company, The. Affinity membranes having pendant hydroxy groups and processes for the preparation and use thereof. 5,006,256, Cl. 210-645.000.
Davis, James C., to Standard Oil Company, The. Affinity membranes having pendant hydroxy groups and processes for the preparation and use thereof. 5,006,287, Cl. 264-41.000.
Davis, Mark S.; and Davis, Patricia S. Portable food/writing tray. 5,005,702, Cl. 206-562.000.
Davis, Patricia S.: *See*—
Davis, Mark S.; and Davis, Patricia S., 5,005,702, Cl. 206-562.000.
Davis, Paul J.; Quarmby, Simon C.; and Schoenmakers, Albert W., to Unilever Patent Holdings B.V. Protection. 5,006,341, Cl. 424-442.000.
Davis, Robert A.: *See*—
Lai, Hoi K.; Davis, Robert A.; and Blem, Allen R., 5,006,153, Cl. 71-92.000.
Davis, Steven S., to Envirotech Corporation. Apparatus for shifting filter plates in a filter press. 5,006,241, Cl. 210-225.000.
Dawson, Gary D: *See*—
Bugin, Marion, Jr.; Dawson, Gary D.; Franks, Kerry D.; Geiss, Richard O.; and Kerska, Donald H., 5,005,550, Cl. 123-520.000.
Dawson, Jack W., and Perrault, Norbert M. Self-coloring fishing lures. 5,005,311, Cl. 43-42.320.
Day, Carol A., and Holton, Brian W., to Microbial Developments Ltd. Process for retarding bacterial growth in cheese. 5,006,347, Cl. 426-36.000.
Day International: *See*—
Pinkston, Melvin D., Gaworowski, Andrew J., and Edwards, Stephen B., 5,006,400, Cl. 428-229.000.
Day, Richard A., and Wallace, John, to University of Cincinnati. Selective stereospecific biologically active beta-lactams. 5,006,661, Cl. 548-227.000.
Dayco Products, Inc: *See*—
Lewis, Charles M.; and Pourahmady, Nasser, 5,006,627, Cl. 528-170.000.
DDI Pharmaceuticals, Inc.: *See*—
Saifer, Mark, Somack, Ralph; and Williams, L. David, 5,006,333, Cl. 424-78.000.
de la Vega, Alberto: *See*—
Ribio, Manuel J., de la Vega, Alberto, and Mueller-Lobeck, Eberhard, 5,006,358, Cl. 426-496.000.

Katircioglu, Haluk; De Beule, John A.; and Mukherjee, Debaditya, 5,006,787, Cl. 324-73.100.
Dederer, Guenter, to Siemens Aktiengesellschaft. Method and apparatus for manufacturing preform panels with preforms for repairing interconnects. 5,005,455, Cl. 83-50.000.
Deere & Company: *See*—
Anstey, Henry D., 5,005,747, Cl. 226-190.000.
Kittle, Carl E.; Paxton, Dennis L.; and Camacho, Abraham, 5,005,913, Cl. 301-128.000.
Popelier, Maurice A.; McCunn, Myron L.; Winter, David C.; Marcinkiel, Dennis L.; Hall, James W.; and Rohren, Ronald E., 5,005,547, Cl. 134-25.100.
Deffayet, Jean, to Thomson-Brandt Armements. Method for the ejection of sub-munitions and projectile applying said method. 5,005,483, Cl. 102-489.000.
Defort, Daniel: *See*—
Sauvinet, Vincent; Fosset, Jean; Valere, Michel; Defort, Daniel; and Boutrouille, Maurice, 5,005,769, Cl. 239-429.000.
DeGroot, Jacob G: *See*—
De Jong, Jan L.; and DeGroot, Jacob G., 5,006,476, Cl. 437-31.000.
Deguchi, Mikio, to Mitsubishi Denki Kabushiki Kaisha. Apparatus for producing semiconductor devices. 5,006,192, Cl. 156-345.000.
Degussa Aktiengesellschaft: *See*—
Kuhn, Werner; and Zilske, Wolfgang, 5,006,208, Cl. 204-44.000.
Ludwig, Karl; van Raemdonck, Edwin; Stutzel, Klaus; and Vingerhoets, Marcel, 5,006,654, Cl. 544-219.000.
DeHart, Mark J., to Boeing Company, The. Asymmetrical triangular patch antenna element. 5,006,857, Cl. 343-700.0MS.
DeHoff, Edward J: *See*—
Shuey, Lyle W.; DeHoff, Edward J.; and Schenk, Donald E., 5,005,919, Cl. 303-119.000.
De Jong, Jan L., and DeGroot, Jacob G., to North American Philips Corp., Signetics Division. Transistor manufacturing process using three-step base doping. 5,006,476, Cl. 437-31.000.
De Jonge, Adriaan: *See*—
Engel, Wolfhard, Eberlein, Wolfgang; Mihm, Gerhard, Trummlitz, Gunther, Mayer, Norbert; and De Jonge, Adriaan, 5,006,522, Cl. 514-221.000.
Delaite, Richard: *See*—
Besson, Raymond, Delaite, Richard; Renard, Georges, Valentin, Jean-Pascal, and Vaterkowski, Jean-Louis, 5,006,750, Cl. 310-348.000.
Delaware Capital Formation, Inc.: *See*—
Ulle, Detlef, 5,005,468, Cl. 92-33.000.
Delcorps, Michel; and Tanghe, Hans, to Plavina & Cie (Societe en Nom Collectif). Impermeable membrane resistant to chemical agents and impermeable enclosure produced using such membranes. 5,006,377, Cl. 428-34.700.
Dellinger, Jack A., to BASF Corporation. Molecular weight controller composition for aqueous polymerization of lactam to polyamide. 5,006,635, Cl. 528-315.000.
Delphax Systems: *See*—
Buchan, W. R.; and McCallum, Robert S., 5,006,869, Cl. 346-159.000.

DeMarinis, Robert M.: *See*—
Lafferty, John J.; DeMarinis, Robert M.; and Shah, Dinubhai H., 5,006,521, Cl. 514-215.000.
De Martino, Ronald N.: *See*—
Thackara, John I.; Lipscomb, George F.; Yoon, Hyun-Nam; and De Martino, Ronald N., 5,006,285, Cl. 264-1.300.
Demazeau, Gerard, Martel, Olivier; Devalette, Michel; and Verdon, Eric, to Rhone-Poulenc Chimie. Particulate compositions of rare earth oxide and method of making same. 5,006,318, Cl. 423-21.100.
Den Besten, Leroy E.: *See*—
Beach, Wayner H., Den Besten, Leroy E.; and Rowlett, Don C., 5,005,622, Cl. 144-241.000.
Denda, Akira, to NEC Corporation. Three state emitter coupled logic circuit with a small amount of current consumption. 5,006,731, Cl. 307-455.000.
Den Hartog, Herman C.; Konsza, Eileen E.; Matthews, James F.; and Werner, Ervin R., Jr., to Du Pont de Nemours, E. I., and Company. Waterbased methylol (meth)acrylamide acrylic polymer and polyurethane containing coating composition. 5,006,413, Cl. 428-463.000.
Denizou, Jean-Pierre, to Framatome & CIE. Device for guiding the control clusters of nuclear reactors. 5,006,305, Cl. 376-353.000.
Denker, James G. Portable work station. 5,005,470, Cl. 98-115.300.
Dennison, Kathleen A., Kolcinski, Bruce E.; Krishnan, Subramanian; and Russell, Patrise M., to Minnesota Mining and Manufacturing Company. Asymmetric porous polyamide membranes. 5,006,247, Cl. 210-500.380.
DeNora Permelec S.p.A.: *See*—
Bornone, Pierluigi A., Caizzi, Vittorio; Marzupio, Maurizio; and Morris, Jean E., 5,006,215, Cl. 204-253.000.
Depew, Llewellyn E., to Filter Queen Ltd. Feed and separation device. 5,006,018, Cl. 406-18.000.
Dern, Robert J., to Bell Communications Research, Inc. Integrated semiconductor waveguide/photodetector. 5,006,906, Cl. 357-16.000.
Dery, Ronald A.; Deak, Frederick R., and Zimmerman, Richard H., to AMP Incorporated. Polymeric electrical interconnection apparatus and method of use. 5,006,286, Cl. 264-40.200.
DeSmet, Gabriel, to Sollac. Method and device for forming a sheet-metal blank in particular for making a cathode tube mask, and cathode tube mask obtained according to this method. 5,005,396, Cl. 72-309.000.
Desmouliere, Georges, to 501 Sirc Societe Industrielle de Reliure et de Cartonnage. Process and apparatus for industrial bookbinding and binding thereby obtained. 5,005,870, Cl. 281-21.100.
de Solminihac, Francois, to Thomson-CSF. Device providing for the safety of a man overboard. 5,006,831, Cl. 340-573.000.
Detector Electronics Corporation: *See*—
Powell, Brian D., 5,006,710, Cl. 250-340.000.
Detroit Stoker Company: *See*—
Johnson, Neil H., 5,006,323, Cl. 423-244.000.
Deutsch, Alina, and Rubin, Barry J., to International Business Machines Corporation. Floating orthogonal line structure for X-Y wiring planes. 5,006,918, Cl. 357-71.000.
Devalette, Michel: *See*—
Demazeau, Gerard; Martel, Olivier, Devalette, Michel; and Verdon, Eric, 5,006,318, Cl. 423-21.100.
Deyo, Charles C.; Wolters, Thomas R., and Oas, Robert H., to Rockwell International Corporation. Method of manufacturing an E/M shielded RF circuit board. 5,005,283, Cl. 29-829.000.
Dhont, Bernard: *See*—
Guilbert, Roland; and Dhont, Bernard, 5,006,825, Cl. 333-245.000.
D'Hooge, Richard E: *See*—
Bailey, Kevin L.; and D'Hooge, Richard E., 5,005,881, Cl. 297-45.000.
Diafoil Company, Limited: *See*—
Sakamoto, Seiji, Kawaguchi, Chikakazu; Meguro, Yoshio; Harada, Takashi, and Takisawa, Toshifumi, 5,006,589, Cl. 524-430.000.
Di Amico, Paul A. Twisting pasta fork. 5,005,293, Cl. 30-322.000.
Diamond, Gary. Self-illuminating glass block construction unit. 5,006,967, Cl. 362-147.000.
Dias, Daniel M: *See*—
Iyer, Balakrishna R.; Dias, Daniel M.; and Dishon, Yitzhak, 5,007,053, Cl. 371-21.100.
Diaz, David P., to Fleming, Stephen S. Garment decoration with a process for its manufacture. 5,005,219, Cl. 2-244.000.
Diaz, Juan A.; Goldston, Mark R., White, Spencer; Miller, David E.; Legassie, Charles P.; Russell, Wayne, and Ringel, Judith C., to Reebok International Ltd. Tubular cushioning system for shoes. 5,005,300, Cl. 36-114.000.
DiBella, Eugene P., to Huls America Inc. Stain-resistant plasticizer compositions and method of making same. 5,006,585, Cl. 524-293.000.
Dick, Dieter: *See*—
Wendel, Friedrich; and Dick, Dieter, 5,005,545, Cl. 123-337.000.
Dick, Heinrich, to J. M. Voith GmbH. Electromagnet with plunger. 5,006,901, Cl. 335-258.000.
Dickneite, Gerhard: *See*—
Schwab, Wilfried; Bartlett, Robert R., Gebert, Ulrich; Schorlemmer, Hans U.; Dickneite, Gerhard; and Sedlacek, Hans H., 5,006,515, Cl. 514-89.000.
Didyk, Witalij: *See*—
Fenne, Kenneth R., Steward, Wayne D.; and Didyk, Witalij, 5,006,779, Cl. 320-2.000.
Diehl, Henry. Combination toy chest and table. 5,005,925, Cl. 312-282.000.
Dieleman, Robert: *See*—
McGhie, James R.; and Dieleman, Robert, 5,005,851, Cl. 280-407.100.
Diels, Gasto S. M.: *See*—
Janssens, Frans E.; Torremans, Joseph L. G.; and Diels, Gasto S. M., 5,006,527, Cl. 514-253.000.
Diesel Kiki Co., Ltd.: *See*—
Kurihara, Kazumasa; and Takahashi, Tsutomu, 5,005,687, Cl. 192-0.073.

Romance, Kenneth A., 5,006,604, Cl. 525-173.000
Shepherd, Freddie A., and Light, Ronald R., 5,006,613, Cl. 525-444.000.
Speer, Larry W., 5,005,516, Cl. 118-657.000
Stearns, Floyd E., 5,006,903, Cl. 355-308.000
Szajewski, Richard P., Burns, Paul A.; Poslusny, Jerrold N., Platt, Norma B., and Norden, Timothy D., 5,006,448, Cl. 430-505.000
Wash, Michael L., 5,006,873, Cl. 354-106.000

Eaton Corporation *See—*
Duve, John P., 5,005,382, Cl. 68-12.160.

Eaton-Kenway, Inc. *See—*
Pipes, George R., 5,005,681, Cl. 192-7.000
Pipes, George R., 5,005,912, Cl. 301-111.000

Eatwell, Graham P.: *See—*
Acton, Elizabeth; Cargill, Alexander M., Ross, Colin F., and Eatwell, Graham P., 5,005,353, Cl. 60-39.281

Ebata, Takashi *See—*
Itoh, Kazuo, Naoi, Yoshitake; Matsushita, Hajime, Ebata, Takashi, and Kawakami, Hiroshi, 5,006,646, Cl. 536-23.000.

Eberle, Tod F., to Hoover Universal, Inc. Polyester container for hot fill liquids. 5,005,716, Cl. 215-1.00C

Eberlein, Wolfgang *See—*
Engel, Wolfhard; Eberlein, Wolfgang, Mihm, Gerhard, Trummlitz, Gunther; Mayer, Norbert, and De Jonge, Adriaan, 5,006,522, Cl. 514-221.000

Ebersole, Ronald J.; Johnson, David, Budde, David, Myers, Mark S.; and Bier, Gerhard, to Siemens Ak., and Intel Corporation. Method of increasing the bandwidth of a packet bus by reordering reply packets. 5,006,982, Cl. 364-200.000.

Ebihara, Heihachiro: *See—*
Suzuki, Fuminori; and Ebihara, Heihachiro, 5,006,933, Cl. 358-236.000

Eblen, Ewald *See—*
Rembold, Helmut, Pflug, Hannes; Christ, Wilhelm, Siebert, Hans-Joachim; Eblen, Ewald, Rodriguez-Amaya, Laufer, Helmut, Schmitt, Alfred; Pape, Werner, Buisson, Dominique, Lauvin, Pierre; Potz, Detlev, Simon, Nikolaus, Pigeroulet, Jean, and Karle, Anton, 5,005,548, Cl. 123-450.000

Ecolab Inc *See—*
Olson, Lynne A.; and Stanley, Patricia M., 5,006,126, Cl. 8-401.000

Ecole Nationale Superieure de Mecanique et des Microtechniques: *See—*
Besson, Raymond; Delaite, Richard; Renard, Georges, Valentin, Jean-Pascal, and Vaterkowski, Jean-Louis, 5,006,750, Cl. 310-348.000.

Eda, Kazuo, to Matsushita Electric Industrial Co., Ltd. Semiconductor laser apparatus. 5,007,066, Cl. 372-108.000.

Edelman, Karl W. Rearview mirror. 5,005,962, Cl. 350-625.000

Edelson, Michael W.: *See—*
Masson, Ronald K., and Edelson, Michael W., 5,007,078, Cl. 379-75.000

Edgecraft Corporation *See—*
Friel, Daniel D., 5,005,319, Cl. 51-58.000

Edgren, David E., and Theeuwes, Felix, to Alza Corporation. Delivery system. 5,006,346, Cl. 424-473.000

Edison, David H. *See—*
Bice, Archie R., Edison, David H.; Fish, Floyd H., Jr., Hopkins, Mark W.; and Okine, Richard K., 5,006,294, Cl. 264-138.000.

Edwards, Evan A., Harissis, Peter J., and Menon, Krishna S., to Eastman Kodak Company. Baffled particulate material housing. 5,006,246, Cl. 210-264.000

Edwards, Harper, McNew & Company: *See—*
Edwards, John W.; Harper, Daniel R., and McNew, Quinton B., 5,005,921, Cl. 305-35.0EB.
Edwards, John W.; Harper, Daniel R., and McNew, Quinton B., 5,005,922, Cl. 305-35.0EB
Edwards, John W.; Harper, Daniel R., and McNew, Quinton B., to Edwards, Harper, McNew & Company. Endless track drive system. 5,005,921, Cl. 305-35.0EB
Edwards, John W., Harper, Daniel R., and McNew, Quinton B., to Edwards, Harper, McNew & Company. Double V-shaped endless track drive system. 5,005,922, Cl. 305-35.0EB

Edwards, Stephen B. *See—*
Pinkston, Melvin D.; Gaworowski, Andrew J.; and Edwards, Stephen B., 5,006,400, Cl. 428-229.000

Effland, Richard C., and Wettlaufer, David G., to Hoechst-Roussel Pharmaceuticals Inc. Thienobenzoxepins and analgesic compositions thereof. 5,006,536, Cl. 514-321.000.

Effland, Richard C., and Wettlaufer, David G., to Hoechst-Roussel Pharmaceuticals, Inc. 1,3-dihydro-1-(pyridinylamino)-2H-indol-2-ones. 5,006,537, Cl. 514-339.000

Egawa, Toshihiko; and Odashima, Satoshi, to Shin Etsu Polymer Co., Ltd. Anti-glare covering for illuminate indicator. 5,005,949, Cl. 350-276.00R

Egermeier, John C.; Ellzey, Janet; and Walker, Delroy, to Fusion Systems Corporation. Reaction chamber having non-clouded window. 5,005,519, Cl. 118-722.000

Eggink, Hendrik H. J.; Friedrichs, Winand H. A. M.; Netten, Adriaan, Van Der AA, Herman H. M., and Schuiteman, Martin W., to U.S. Philips Corporation. Electrodeless low-pressure discharge lamp. 5,006,752, Cl. 313-161.000

Egyud, Julius. *See—*
Squillante, Peter L., Egyud, Julius, and Karron, Abraham, 5,007,019, Cl. 364-900.000.

Ehret, Charles F., and Ashton, William T., Jr., to Kinetic Software, Inc. Computer system for minimizing body dysfunctions induced by jet travel or shift work. 5,006,985, Cl. 364-413.010

Eichel, Hermman J. Method of avoiding a continuous clench position of the hand and fingers. 5,005,824, Cl. 272-67.000

Eicken, Karl *See—*
Rheinheimer, Joachim, Eicken, Karl, Plath, Peter, Westphalen, Karl-Otto, and Wuerzer, Bruno, 5,006,155, Cl. 71-92.000.

Eiji, Shibata *See—*
Kazuhito, Ishida; Eiji, Shibata; and Kazumasa, Makino, 5,006,884, Cl. 355-27.000

Eilingsfeld, Heinz: *See—*
Hagen, Helmut, Dupuis, Jacques, and Eilingsfeld, Heinz, 5,006,659, Cl. 546-170.000.

Eisai, Co.: *See—*
Kamiya, Takashi; Naito, Toshihiko; Negi, Shigeto, Komatu, Yuuki; Kai, Yasunobu; Nakamura, Takaharu, Sugiyama, Isao, Machida, Yoshimasa; Nomoto, Seiichiro, Kitoh, Kyosuke, Katsu, Kanemasa, and Yamauchi, Hiroshi, 5,006,649, Cl. 540-222.000.

Eisenbraun, Allan A., and Blocker, Wesley C., to Ethyl Corporation. Compositions for production of electronic coatings. 5,006,370, Cl. 427-240.000.

Eitan, Boaz *See—*
Kazerounian, Reza; Ali, Syed; and Eitan, Boaz, 5,006,974, Cl. 363-60.000.

Ekstrom Industries, Inc *See—*
Robinson, Darrell, and Shincovich, John T., 5,006,076, Cl. 439-146.000

Eldin, Sameer H. *See—*
Schmid, Rolf, and Eldin, Sameer H., 5,006,611, Cl. 525-423.000

Eldridge, John D., Jr., and Morgan, Mary A., to Jodel Medical Products, Inc. Surgical instrument tray. 5,005,590, Cl. 128-849.000

Electric Power Research Institute, Inc. *See—*
Kibler, Jack M., Schmotzer, Jack K., and Stauffer, Charles C., 5,005,430, Cl. 73-863.010
McKubre, Michael C. H., and Syrett, Barry C., 5,006,786, Cl. 324-71.200

Electrochemical Technology Corp. *See—*
Beck, Theodore R., and Brooks, Richard J., 5,006,209, Cl. 204-67.000

Eli Lilly and Company *See—*
Cullinan, George J., Laguzza, Bennett C., and Scott, William L., 5,006,652, Cl. 540-478.000
Schaus, John M., 5,006,525, Cl. 514-232.800

Elias, Hartmut *See—*
Sontag, Heinz, Elias, Hartmut, Ludwig, Wolfgang, Fritzsch, Walter, Eschner, Wolfgang, Hundhausen, Rainer, and Kratz, Harald, 5,005,979, Cl. 356-375.000

Elin-Union *See—*
Sonntagbauer, Ernst, 5,006,784, Cl. 323-343.000

Elison, Hans-Dieter *See—*
Reik, Wolfgang, and Elison, Hans-Dieter, 5,005,636, Cl. 192.70-170

Elkem a/s *See—*
Herfurth, Eike, 5,005,768, Cl. 239-417.000

Ellingham, David J. *See—*
Baughman, Richard C., Ellingham, David J., Fowlkes, William Y., Rubin, Bruce J., and Stepanik, Frank S., 5,006,900, Cl. 355-271.000

Elliott, Dolores D., and Elliott, M. Edmund. Powder dispensing and measuring device. 5,005,657, Cl. 177-246.000

Elliott, M. Edmund *See—*
Elliott, Dolores D., and Elliott, M. Edmund, 5,005,657, Cl. 177-246.000

Elliot, John G. *See—*
Roehrs, Daniel C., Caruso, Angelo T., Grace, Robert F., Mara, Robert M., Elliot, John G., Saraceno, Patricia J., and Pacer, James M., 5,006,892, Cl. 355-208.300

Elliott, Robert C. Process controller including power level control and method of operation. 5,006,695, Cl. 219-494.000

Ellis, Jim E. *See—*
Short, Edward H., III, and Ellis, Jim E., 5,005,722, Cl. 220-89.100

Ellis, Wladislaw V. Method for relieving chronic pain with a somatostatin analog composition. 5,006,510, Cl. 514-16.000

Ellzey, Janet *See—*
Egermeier, John C., Ellzey, Janet, and Walker, Delroy, 5,005,519, Cl. 118-722.000

Elms, Robert T., to Westinghouse Electric Corp. Bidirectional communication and control network with programmable microcontroller interfacing digital ICS and controlled product. 5,007,013, Cl. 364-900.000

Elsasser, Dieter, and von der Heide, Johann, to Papst-Motoren GmbH & Co. KG. Disk storage drive. 5,006,943, Cl. 360-99.080

Elsenbaumer, Ronald L., to Allied-Signal. Solution processible forms of electrically conductive polyaniline and the method of manufacture of electroconductive articles therefrom. 5,006,278, Cl. 427-385.500

Elsner, Frederick H. *See—*
Woolf, Lawrence D., Elsner, Frederick H., and Raggio, William A., 5,006,507, Cl. 505-1.000

Eltec Instruments, Inc. *See—*
Keller, Hans J., 5,006,712, Cl. 250-353.000

ELTECH Systems Corporation *See—*
Dietrich, Joseph J., Niksa, Andrew J., and Stewart, James J., 5,006,216, Cl. 204-257.000

Emerson Electric Co. *See—*
Steiner, Robert E., and Soultanian, Daniel S., 5,005,252, Cl. 15-339.000
Wallick, Claude R., Jr., and Schmitt, Thomas J., 5,005,280, Cl. 29-434.000

Emhart Inc. *See—*
Schmitt, Klaus G., and Knetsch, Harald, 5,006,686, Cl. 219-99.000

Emhart Industries Inc. *See—*
Smith, John W., and Meagher, James P., 5,006,677, Cl. 200-61.890

Emura, Tatuo, and Ohba, Kiyoshi, to Kabushiki Kaisha Hokkaido Nissin Soybean protein food product. 5,006,350, Cl. 426-46.000

Endo, Kenichi *See—*
Shimoda, Tatsuya, Seto, Takeshi, Endo, Kenichi, Yamaha, Yoshikazu, and Takagi, Nobukazu, 5,006,045, Cl. 417-42.000

Endo, Kenji *See—*
Nagata, Shinichi, Kikkawa, Atsushi, and Endo, Kenji, 5,005,959, Cl. 350-452.000

Endo, Misao, and Kambayashi, Shigemi, to Fuji Jukogyo Kabushiki Kaisha. Wiper device of a motor vehicle. 5,005,897, Cl. 296-192.000

Endo, Naraki *See—*
Yamamoto, Takeomi, Endo, Naraki, Kadota, Yasushi, and Yamakawa, Tadasu, 5,005,541, Cl. 123-90.350

Endo, Osamu *See—*
Suzuki, Seizo, Sakuma, Nobuo, Yamaguchi, Katsumi, and Endo, Osamu, 5,005,928, Cl. 350-6.100

Endo, Zen-ichiro *See—*
Hara, Shigeyoshi, Endo, Zen-ichiro, and Mera, Hiroshi, 5,006,616, Cl. 526-75.000

Endress u. Hauser GmbH u. Co. *See—*
Hegner, Frank, Dittrich, Gerhard, and Klahn, Thomas, 5,005,421, Cl. 73-72.000

Engel, Dieter, and Rinno, Helmut, to Hoechst Aktiengesellschaft. Emulsion polymers free from emulsifiers and protective colloids, a process for their preparation and their use. 5,006,617, Cl. 526-87.000

Engel, Rudiger A. *See—*
Rahrooh, Ghobad, and Engel, Rudiger A., 5,006,354, Cl. 426-231.000

Engel, Wolfhard, Eberlein, Wolfgang, Mihm, Gerhard, Trummlitz, Gunther, Mayer, Norbert, and De Jonge, Adriaan, to Karl Thomae GmbH. Condensed diazepinones, processes for preparing them and pharmaceutical compositions containing these compounds. 5,006,522, Cl. 514-221.000

Engelbrecht, Dennis R., to Hewlett-Packard Company. Bidirectional current limiting circuit. 5,006,734, Cl. 307-544.000

Engelhard Corporation *See—*
Medly, Zoltan M., 5,006,175, Cl. 106-439.000
Sennett, Paul, and Brown, Steven A., 5,006,574, Cl. 523-351.000

Engels, Hans-Wilhelm *See—*
Gupta, Pramod, Engels, Hans-Wilhelm, and Rabe, Hansjurgen, 5,006,599, Cl. 524-740.000

Engineering & Research Associates, Inc. *See—*
Acker, Loren C., and Harmony, Daniel C., 5,006,119, Cl. 606-27.000

Enidine Incorporated *See—*
Bucholtz, Brian C., and Miller, Thomas J., 5,005,677, Cl. 188-299.000

Envirotech Corporation *See—*
Davis, Steven S., 5,006,241, Cl. 210-225.000

Eprova AG *See—*
Müller, Hans R., Ulmann, Martin, Conti, Josef, and Murdel, Gunter, 5,006,655, Cl. 544-258.000

Erich, Otis G., Jr., to Union Oil Company of California. Apparatus for positioning geophones in shallow holes. 5,007,031, Cl. 367-178.000

Erickson, Alan R., to Rockwell International Corporation. Power amplifier with built-in test circuit. 5,006,812, Cl. 330-2.000

Eriksson, Lennart *See—*
Andersson, Kjell, and Eriksson, Lennart, 5,006,994, Cl. 364-442.000

Eru, Inc. *See—*
Webster, James M., Jr., 5,005,623, Cl. 150-159.000

Erving, Richard H., Ford, William A., and Miller, Robert R., II, to AT&T Bell Laboratories. Computer controlled adaptive speakerphone. 5,007,046, Cl. 370-32.100

Esaki, Hideya *See—*
Tsutsu, Noriko, Nakata, Yoshiro, and Esaki, Hideya, 5,006,717, Cl. 250-484.100

Eschner, Wolfgang *See—*
Sontag, Heinz, Elias, Hartmut, Ludwig, Wolfgang, Fritzsch, Walter, Eschner, Wolfgang, Hundhausen, Rainer, and Kratz, Harald, 5,005,979, Cl. 356-375.000

ESCO Corporation *See—*
Briscoe, Terry L., and Sprunger, Paul C., 5,005,304, Cl. 37-141.00R

Espat, Ricardo *See—*
Vines, Arthur D., Schonfeld, Frederick A., and Espat, Ricardo, 5,006,841, Cl. 340-825.070

Espenan, Jean-Michel, to Lyonnaise des Eaux. Method of manufacturing a unit assembly of filter membranes, a mold used in the method, and a product obtained from the method. 5,006,229, Cl. 210-321.890

Estrada, Carlos I. Particle retention means associated with fastener. 5,006,026, Cl. 411-369.000.

Etat Francais Represente Par le Ministere des Postes *See—*
Morin, Francois, 5,005,950, Cl. 350-333.000

G. M. Pfaff Aktiengesellschaft *See*—
Alblrecht, Ernst, and Dinges, Harald, 5,005,504, Cl. 112-292.000
Gaddis, David Q. *See*—
Beverly, William C., II; Dalton, Michael B., and Gaddis, David Q., 5,006,790, Cl. 324-104.000.
Gaddy, Edward M., to Solarex Corporation. Interconnect for electrically connecting solar cells. 5,006,179, Cl. 136-244.000.
Gadoury, Andre *See*—
Beauchemin, Gratien; Gadoury, Andre, and Gravel, Claude, 5,006,225, Cl. 209-3.300
GAF Chemicals Corporation *See*—
Smith, Terry E., Cho, James R., and Cottrell, Ian W., 5,006,595, Cl. 524-548.000
Gaffney, Barney J *See*—
Dahlstrom, Donald, Dybing, Stephen, and Gaffney, Barney J., 5,006,349, Cl. 426-39.000
Gahan, Michael, to Ciba-Geigy Corporation. Granules of alkyl esters containing hydroxyphenyl groups. 5,006,284, Cl. 264-9.000
Gahler, Franz. Process for producing foundry molds and cores from sand and a binder. 5,005,630, Cl. 164-16.000
Gaiatto, Daniele; Menguzzato, Gianni, and Villis, Michelle, to Brancale S.R.L. Protection helmet. 5,005,220, Cl. 2-421.000
Gal, Laszlo V., Judy, James E., Jr., and Prentiss, Kenneth C., to Unisys Corporation. Module for preventing instability in integrated circuit testers. 5,006,794, Cl. 324-158.00R
Galand, Claude, Menez, Jean, and Rosso, Michele, to International Business Machines Corporation. Method and apparatus for dynamically adapting a vector-quantizing coder codebook. 5,007,092, Cl. 381-36.000
Galbraith, Lyle D. *See*—
Schneider, Mark D., Hoskins, Randy L., Galbraith, Lyle D., and Dusenberry, Gary L., 5,005,481, Cl. 102-393.000
Galeski, Andrzej *See*—
Piorkowska-Galeska, Ewa; and Galeski, Andrzej, 5,005,985, Cl. 374-44.000
Galgana, Russell J., to Smith & Mahoney, P.C. Receiving assembly for solid waste disposal system. 5,006,029, Cl. 414-327.000
Galileo Electro-Optics Corporation *See*—
Curtiss, Lawrence E., 5,005,934, Cl. 350-96.150
Gallagher, Anthony. Patterns for determining the profile of an arch. 5,005,799, Cl. 249-19.000
Gandiglio, Romolo, and Bellone, Ernestino, to Fiat Auto S.p.A. Steering device for the rear axle of a motor vehicle. 5,005,849, Cl. 280-97.000
Gantzhorn, John E., Jr.; and Nann, Steven R., to Du Pont de Nemours, E. I., and Company. Method for fabricating multilayer circuits. 5,006,182, Cl. 156-089.000
Ganz, Daniel, to Ganz Manufacturing Co., Inc. Garment. 5,005,218, Cl. 2-69.000
Ganz Manufacturing Co., Inc *See*—
Ganz, Daniel, 5,005,218, Cl. 2-69.000
GAO Gesellschaft fur Automation und Organisation mbH *See*—
Lass, Joseph; Merkle, Hansjurgen; Hierweger, Alexander, and Lob, Erwin, 5,005,872, Cl. 283-85.000
Garcia, Henry E. *See*—
Loescher, Thomas C.; Shanks, Thomas P., and Garcia, Henry E., 5,005,568, Cl. 128-202.280
Gardiner, John B.; Loffredo, Anthony A.; Bloch, ricardo; Nahas, Nicholas C.; Ingold, Keith U., and Kowalchyn, Theodore V., to Exxon Chemical Patents, Inc. Catalytic process for oxidative, shear accelerated polymer degradation. 5,006,608, Cl. 525-370.000
Garg, Diwakar; Wreesies, Ernest L., Schaffer, Leslie E., Mueller, Carl F., Dyer, Paul N., and Fabregas, Keith R., to Air Products and Chemicals, Inc. Low temperature chemical vapor deposition method for forming tungsten and tungsten carbide. 5,006,371, Cl. 427-249.000
Garrel, Jean-Marie *See*—
Falempin, Francois; Sans, Claude; Champigny Patrick, Laruelle, Gerard, and Garrel, Jean-Marie, 5,005,782, Cl. 244-53.00B
Garrison, Michi E., Pelmulder, John P., and Renger, Herman L., to Pacesetter Infusion, Ltd. Air-in-line detector infusion system. 5,006,110, Cl. 604-65.000
Gas Research Institute *See*—
Virkar, Anil V., 5,006,494, Cl. 501-152.000
Gaskin, Frances C. Compositions and method of strengthening hair. 5,006,331, Cl. 424-70.000
Gassiat, Alain L., to Societe Anonyme Carbone Industrie. Disk for disk-brake. 5,005,676, Cl. 188-218.0XL
Gattaz, Wagner F., to Abbott Laboratories. Method for the detection of schizophrenia. 5,006,462, Cl. 435-7.400
Gatzemeyer, Dwight L. *See*—
Sorensen, Joseph A., and Gatzemeyer, Dwight L., 5,005,449, Cl. 81-152.000
Gaultier, Jean-Marie, Farrugia, Augustin, and Conan, Bertrand, to SGS-Thomson Microelectronics S.A. Method for the testing of one time programmable memories and corresponding memory. 5,007,026, Cl. 365-201.000
Gaworowski, Andrew J. *See*—
Pinkston, Melvin D., Gaworowski, Andrew J., and Edwards, Stephen B., 5,006,400, Cl. 428-229.000

Gleason, Dana W. Adjustable backpack. 5,005,744, Cl. 224-211.000.
Gleason, K. Reed; and Jones, Keith E., to Cascade Microtech, Inc. High-frequency active probe having replaceable contact needles. 5,006,793, Cl. 324-158.00P.
Gleckman, Philip L.: *See*—
Winston, Roland; Gleckman, Philip L., and O'Gallagher, Joseph J., 5,005,958, Cl. 350-442.000.
Gluck, Reinhard; and Germanier, Rene, to Swiss Serum & Vaccine Institute; and Institute for the Research of Infectious Diseases. Live vaccine against mumps and process for obtaining thereof. 5,006,335, Cl. 424-89.000.
Gluckstein, Martin E.: *See*—
Balasubramanian, Mannarsamy; Gluckstein, Martin E.; and Hornbaker, Edwin D., 5,006,625, Cl. 528-14.000.
Goebel, Franz; and Hossain, Sohrab, to Yardney Technical Products, Inc. Getter electrode and improved electrochemical cell containing the same. 5,006,428, Cl. 429-101.000.
Goex, Inc.: *See*—
Davis, Billy F.; Hancock, Michael P.; and Hayes, Scott L., 5,005,694, Cl. 206-3.000.
Gold, Philip W.: *See*—
Sternberg, Esther M., Wilder, Ronald L.; Chrousos, George P.; and Gold, Philip W., 5,006,330, Cl. 424-9.000
Goldberg, Edward, to NEC Electronics Inc. Microcomputer control of stepper motor using reduced number of parts. 5,006,773, Cl. 318-696.000.
Goldberg, Edward M.; Bettencourt, Daniel, Jr.; Tosti, James C., Jr.; and Jones, Norman S., to Precision Engineered Systems Inc. Blanket wash system with sub-ambient pressure circulation. 5,005,478, Cl. 101-425.000.
Goldberg, Herbert F. Refractometer readout system. 5,005,972, Cl. 356-135.000.
Golden Valley Microwave Foods, Inc.: *See*—
Watkins, James D., Andreas, David W.; and Cox, David H., 5,006,405, Cl. 428-323.000.
Goldstar Co., Ltd.: *See*—
Kim, Soo K., 5,005,748, Cl. 226-190.000
Goldston, Mark R.: *See*—
Diaz, Juan A., Goldston, Mark R., White, Spencer, Miller, David E.; Legassie, Charles P., Russell, Wayne; and Ringel, Judith C., 5,005,300, Cl. 36-114.000.
Goldwell GmbH: *See*—
Tennigkeit, Jurgen; and Lorenz, Herbert, 5,006,127, Cl. 8-406.000.
Gonser, Jochen, to Veit Transpo GmbH Conveyor carriage. 5,005,690, Cl. 198-350.000.
Goodwin, John C.; Kirby, Roy, and Langley, Ernest A., to Dowty Maritime Systems Limited. Cover release mechanisms. 5,005,725, Cl. 220-261.000.
Goodyear Tire & Rubber Company, The: *See*—
Clark, John K., 5,006,606, Cl. 525-233.000
Klemmensen, Daniel F.; and Beers, Roger N., 5,005,625, Cl. 152-510.000.
Stanley, John H., 5,005,613, Cl. 141-45.000.
Warmuth, Ivan J., II; and Moeglin, Steven J., 5,005,808, Cl. 267-64.270.
Gorbaty, Martin L.: *See*—
Wiehe, Irwin A.; Gorbaty, Martin L.; and Olmstead, William N., 5,006,223, Cl. 208-125.000.
Gordon, Richard A. Tab for animal tank cover. 5,005,522, Cl. 119-5.000.
Goss, John R.: *See*—
Kaplan, Stuart L.; and Goss, John R., 5,006,154, Cl. 71-92.000.
Gossett, Wayne L.: *See*—
Phillips, Roger W.; Spellman, Vernon C.; Gossett, Wayne L.; Kamerling, Marc A.; Coombs, Paul G., Todd, David W.; and Silver, Steven A., 5,005,719, Cl. 215-230.000.
Goth, Gary F.; Moran, Kevin P.; and Zumbrunnen, Michael L., to International Business Machines Corporation. Thermal conduction module with barrel shaped piston for improved heat transfer. 5,005,638, Cl. 165-80.400.
Goto, Hirokazu: *See*—
Ohtsuka, Koji; and Goto, Hirokazu, 5,006,483, Cl. 437-179.000.
Goto, Junkei; and Iida, Tetsuya, to Kabushiki Kaisha Toshiba Analog-to-digital converter with isolated power supply lines to the individual components. 5,006,852, Cl. 341-155.000
Goulette, Richard R.; Xavier, Stanilus K., and Greenfield, Raymond L., to Northern Telecom Limited. Method and apparatus for monitoring electromagnetic emission levels. 5,006,788, Cl. 324-95.000.
Gourley, Ted H.; Maxwell, Thomas P., Hacker, Thomas G.; Miller, William W.; and Yafuso, Masao, to Minnesota Mining and Manufacturing Company. Sensor and method for sensing the concentration of a component in a medium. 5,006,314, Cl. 422-82.070.
Goyden, Denise D.: *See*—
Hall, Richard E.; and Goyden, Denise D., 5,006,319, Cl. 423-54.000.
Gozani, Tsahi; and Shea, Patrick M., to Science Applications International Corporation. Explosive detection system. 5,006,299, Cl. 376-159.000.
Grabstein, Kenneth H.: *See*—
Anderson, Dirk M.; Baker, Paul E.; Cantrell, Michael A.; Cerretti, Douglas P.; Cosman, David J.; Gimpel, Steven D.; Grabstein, Kenneth H.; Larsen, Alf D.; and McKereghan, Kate N., 5,006,465, Cl. 435-69.520.
Grace, Robert E.: *See*—
Roehrs, Daniel C.; Caruso, Angelo T.; Grace, Robert E.; Mara, Robert M., Elliot, John G., Saraceno, Patricia J., and Pacer, James M., 5,006,892, Cl. 355-208.000

Graham, Jeffrey *See—*
Taylor, Benjamin R., Chapman, Mark A. V., and Graham, Jeffrey, 5,007,006, Cl. 364-571.050

Grandvallet, Gilles *See—*
Volland, Michel; Grandvallet, Gilles; and Fourneaux, Roger, 5,005,609, Cl. 139-116.200

Granville, J. Michael, Costa, Robert E., and Chu, Sam Y. Power transmission line monitoring system. 5,006,846, Cl. 340-870.280.

Grasset, Yves. *See—*
Fister, Christian; and Grasset, Yves, 5,005,266, Cl. 24-601.500

Grassi, Fabrizio *See—*
Sartorio, Franco; Grassi, Fabrizio, Prunotto, Gianpaolo, and Sgandurra, Francesco, 5,005,394, Cl. 72-10.000

Gravel, Claude *See—*
Beauchemin, Gratien; Gadoury, Andre, and Gravel, Claude, 5,006,225, Cl. 209-3.300

Gravina, Edoardo, to Fasco S.p.A. Cartridge for a riveting gun 5,005,753, Cl. 227-120.000

Greanias, Evon C., and Donaldson, Robert L., to International Business Machines Corporation. Remotely sensed personal stylus. 5,007,085, Cl. 380-25.000

Green, George A., and Kaczmarek, Stanislaus A., to Exxon Research and Engineering Company. Anaerobic waste water treating process. 5,006,249, Cl. 210-603.000

Green, George D., Munk, Stephen A., and Barnes, Darryl K., to Allied-Signal Inc. Stain-resistant polymers derived from itaconic acid useful as coatings for fibers. 5,006,408, Cl. 428-395.000

Green, Raymond *See—*
Parks, David W.; Parks, Thomas A., and Green, Raymond, 5,005,888, Cl. 294-50.000.

Greenfield, Raymond L. *See—*
Goulette, Richard R., Xavier, Stanilus K., and Greenfield, Raymond L., 5,006,788, Cl. 324-95.000

Greenland Gmph & Co. *See—*
von Allworden, Wilhelm, 5,005,696, Cl. 206-83.500

Greenlee, Mark L. *See—*
DiNinno, Frank P., and Greenlee, Mark L., 5,006,519, Cl. 514-210.000

Greenlee, William J., Veber, Daniel F., and Williams, Peter D., to Merck & Co., Inc. Di- or tripeptide renin inhibitors containing lactam conformational restriction in achpa. 5,006,511, Cl. 514-19.000

Greenough, Ronald L., to MacMillan Bloedel Limited. Boom sticks. 5,006,014, Cl. 405-72.000

Greenspan, Nathan. Superimposing image apparatus. 5,006,885, Cl. 355-43.000

Greenwood, Mark H., to Children On The Go, Inc. Foldable toilet seat. 5,005,223, Cl. 4-235.000

Greer, Douglas S., and Gevins, Alan S., to SAM Technology, Inc. Three-dimensional magnetic resonance image distortion correction method and system. 5,005,578, Cl. 128-653.00A

Gresens, Harry, to Bruckner Trockentechnick GmbH & Co. KG. Conveyor chain for machines for tensioning lengths of material. 5,005,271, Cl. 26-89.000

Gnesbach, Ray H. *See—*
Hustad, Gerald O., and Gnesbach, Ray H., 5,005,707, Cl. 206-632.000

Gnieshop, Vance J. *See—*
Smegal, John A., Bilgic, Haluk A., Ryan, Robert C., and Gnieshop, Vance J., 5,006,224, Cl. 208-254.00H

Griffaton, Jacques, to Framatome. Device for laser welding inside a tubular element. 5,006,268, Cl. 219-121.630

Griffin, Richard D. Outdoor post assembly. 5,006,009, Cl. 404-11.000

Griffis, Edgar E. Method and apparatus for eviscerating scallops. 5,005,258, Cl. 452-18.000.

Grigalauski, Denise A. *See—*
Khalil, Omar S.; Hanna, Charles F.; Zurek, Thomas F., and Grigalauski, Denise A., 5,006,309, Cl. 422-56.000.

Grimes, James T. *See—*
Tusim, Martin H., and Grimes, James T., 5,006,565, Cl. 521-57.000

Griswold, Allen B., Tessier, Paul A., and Koschek, Drew G., to Hewlett-Packard Company. Remote calibrating for pressure transducer. 5,006,835, Cl. 340-626.000

Grobbel, William J., and Berry, Bruce R. Water-based coating removers. 5,006,279, Cl. 252-542.000

Grogan, Larry N. *See—*
Kennedy, William J., Leach, Peter E., and Grogan, Larry N., 5,005,242, Cl. 5-481.000.

Groke, Karl, Miggitsch, Hans; Musil, Horst; and Polzer, Josef, to Leopold & Co., Chem. Pharm. Fabrik Aktiengesellschaft. Composition for destroying malignant tumors. 5,006,551, Cl. 514-461.000.

Grollier, Jean F., to L'Oreal. Composition for inducing and stimulating the growth of hair and/or retarding its loss, based on an amphoteric surface-active agent and on a pyrimidine derivative. 5,006,332, Cl. 424-70.000.

Grondin, Paul-Andre *See—*
Trahan, Alain; Grondin, Paul-Andre; and Bilodeau, Luc, 5,005,503, Cl. 112-277.000.

Grosch, Janos *See—*
Sarkozy, Peter; Pap, Laszlo; Szego, Andras; Nagy, Lajos; Szekely, Istvan; Marmarosi, Katalin, and Grosch, Janos, 5,006,545, Cl. 514-395.000.

Grosse, Debora Y. *See—*
D'Aoust, Robert; Cording, Robert B.; Grosse, Debora Y.; Jennings, Kevin; Krebs, Stephen R.; Reasoner, George E., Jr.; Smith, Gerald R., and Williams, David C., 5,007,100, Cl. 382-49.000.

Grossi, Carl T. *See—*
Breed, Allen K., Thuen, Ted, and Grossi, Carl T., 5,005,861, Cl. 280-734.000

Grossman, Mark W., Speer, Richard, and George, William A., to GTE Products Corporation. Method for mercury refinement. 5,006,165, Cl. 75-407.000

Grote, Michael G. *See—*
Lapinski, John R., and Grote, Michael G., 5,005,640, Cl. 165-170.000

Groveman, Grant D. *See—*
Groveman, Joseph E., and Groveman, Grant D., 5,005,833, Cl. 273-29.00A

Groveman, Joseph E., and Groveman, Grant D. Tennis training aid. 5,005,833, Cl. 273-29.00A.

Gruber, Wolfgang *See—*
Buechner, Oskar, and Gruber, Wolfgang, 5,006,600, Cl. 525-53.000

Grumman Aerospace Corporation *See—*
Brandstetter, Robert W., 5,005,946, Cl. 350-162.120.
Kornely, Michael G., Jr., Micich, Robert G., and Miller, John M., 5,005,757, Cl. 228-178.000

Grunder, Jaana, and Timmermann, Andreas, to ADEV Gesellschaft fur Entwicklung und Vertrieb von medizintechnishen Artikeln mbH. Cervical support. 5,005,564, Cl. 128-75.000.

Grunke, Richard, Peichl, Lothar; Puchinger, Franz, and Wydra, Gerhard, to MTU Motoren-und Turbinen-Union Muenchen GmbH. Structural component made of a titanium alloy and covered by a protective coating and method for producing the coating. 5,006,419, Cl. 428-623.000.

Gryziewicz, Lewis J. *See—*
Jerzewski, Robert L., Wong, Thomas M.; Gryziewicz, Lewis J., Jain, Nemichand B., and Thakur, Ajit B., 5,006,344, Cl. 424-465.000

GTE Products Corporation *See—*
Barlow, Robert W., Swanson, Steven E., and Lynch, Thomas M., 5,005,941, Cl. 350-96.210
Barlow, Robert W., Lynch, Thomas M.; and Swanson, Steven E., 5,005,942, Cl. 350-96.210
Grossman, Mark W., Speer, Richard, and George, William A., 5,006,165, Cl. 75-407.000.
Hsueh, A-Chuan, and Chuang, Chiu-Kuang, 5,007,094, Cl. 381-47.000
Shaffer, John W., 5,006,762, Cl. 315-205.000

Guajardo, Ciro, to Teledyne Industries, Inc. Temperature compensated overload trip level solid state relay. 5,006,949, Cl. 361-18.000.

Guerin, Bernard, and Strassel, Albert, to Atochem. Polyvinylidene fluoride compositions and products made therefrom. 5,006,602, Cl. 525-72.000

Guggenheim, Thomas L.; Fukuyama, James M.; and Kelly, John J., to General Electric Company. Method for preparing copolyestercarbonates from cyclic oligomers. 5,006,637, Cl. 528-355.000

Guilbert, Roland, and Dhont, Bernard, to Thomson-CF. Coaxial line coupler with fluid cooled inner conductor. 5,006,825, Cl. 333-245.000

Guiler, Richard S., to E. J. Brooks Company. Tamper indicator for a locking seal. 5,005,883, Cl. 292-327.000.

Guillon, Henri *See—*
Saint-Louis Augustin, Guy, and Guillon, Henri, 5,005,317, Cl. 49-495.000

Gulliver, David J., to BP Chemicals Limited. Recovery of noble metals. 5,006,166, Cl. 75-413.000

Gulton Industries, Inc. *See—*
Turney, David L., and Relson, Morris, 5,005,305, Cl. 40-449.000

Gumbert, Hans, to U.S. Philips Corporation. Product carrier for circuit boards. 5,005,814, Cl. 269-309.000

Gumm, Jack R., Jr. *See—*
Ward, William E., and Gumm, Jack R., Jr., 5,006,990, Cl. 364-768.000

Gunther, Martin, to Hewlett-Packard Company. Optical probe. 5,005,576, Cl. 128-634.000

Gupta, Pramod, Engels, Hans-Wilhelm, and Rabe, Hansjurgen, to Bayer Aktiengesellschaft. Use of 3,5-di-tert-butyl-4-hydroxyphenylpropionic acid for stabilizing polyether polyols. 5,006,599, Cl. 524-740.000

Gussco Manufacturing, Inc. *See—*
Baum, Seymour, 5,005,324, Cl. 52-98.000

Gutierrez, David *See—*
Yang, Kuang L., Gutierrez, David; and Gimpelson, George E., 5,006,421, Cl. 428-641.000.

Habuchi, Ryoji *See—*
Itoh, Hiroshi; Sugaya, Masami; Soga, Yoshinobu, Morisawa, Kunio, Habuchi, Ryoji, Kouno, Katsumi; and Hattori, Yuji, 5,006,093, Cl. 474-28.000.

Hacker, Thomas G. *See—*
Gourley, Ted H., Maxwell, Thomas P., Hacker, Thomas G., Miller, William W., and Yafuso, Masao, 5,006,314, Cl. 422-82.070.

Hada, Yoshinobu *See—*
Fukui, Kazuyuki, Hattori, Yoshihiro; and Hada, Yoshinobu, 5,005,517, Cl. 118-689.000

Haessig, David L., to Staefa Control System, Inc. Variable air volume ventilating system and method of operating same. 5,005,636, Cl. 165-16.000.

Hafeli, Paul B., to Artifex Ltd. Bone broaches and methods of manufacturing thereof. 5,006,121, Cl. 606-85.000

Hagen, Helmut, Dupuis, Jacques, and Eilingsfeld, Heinz, to BASF Aktiengesellschaft. Preparation of 7-chloroquinoline-8-carboxylic acids. 5,006,659, Cl. 546-170.000.

Haggstrom, Rolf P., to BLH Electronics, Inc. Weigh module. 5,005,429, Cl. 73-862.650.

Hajime Industries Ltd. *See—*
Yoshida, Hajime, 5,007,096, Cl. 382-8.000

Hakamdani, Mitsuhiro *See—*
Iwahashi, Hiroyuki, Nishioka, Yoshiki, and Hakamdani, Mitsuhiro, 5,007,101, Cl. 382-42.000

Hako Minuteman, Inc. *See—*
McLeod, Rick; and Palmer, Gary E., 5,005,251, Cl. 15-327.100.

Hakoda, Keizo, and Samejima, Hisashi, to Bando Kagaku Kabushiki Kaisha. Mold for injection molding of toothed power transmission belt. 5,006,059, Cl. 425-573.000

Hale, Bruce *See—*
Ryan, Kyle A., Ackerman, Michael, Hale, Bruce, and Payne, Ward, 5,005,839, Cl. 273-240.000

Haley, Kevin, to Intel Corporation. Apparatus for surface mounting an integrated circuit package. 5,006,962, Cl. 361-417.000

Haley, William J. *See—*
Neuman, Guenter; and Haley, William J., 5,006,092, Cl. 474-8.000.

Hall, David B., to Litton Systems, Inc. Linear laser with two-swept frequencies of controlled splitting. 5,007,060, Cl. 372-23.000

Hall, David M. *See—*
Patton, Robert T., Kitchens, John D., and Hall, David M., 5,006,125, Cl. 8-188.000

Hall, Dennis G., to Research Corporation Technologies, Inc. Method and system for directional, enhanced fluorescence from molecular layers. 5,006,716, Cl. 250-458.100.

Hall, James W. *See—*
Popelier, Maurice A.; McCunn, Myron L., Winter, David C., Marchael, Dennis L., Hall, James W., and Rohren, Ronald E., 5,005,597, Cl. 134-25.100.

Hall, John D. Instrumented drift fish aggregating device and method. 5,005,309, Cl. 43-4.000

Hall, Richard E. and Goyden, Denise D., to FMC Corporation. Process for removing iron, chromium and vanadium from phosphoric acid. 5,006,319, Cl. 423-54.000

Hall, Steven E.; and Stein, Philip D., to E. R. Squibb & Sons, Inc. Arylthioalkylphenyl carboxylic acids, derivatives thereof, compositions containing same and method of use. 5,006,542, Cl. 514-381.000

Halleo Fabricators, Inc. *See—*
Croket, Frank M., 5,006,236, Cl. 210-162.000

Halliburton Company *See—*
Bragg, Dale E., and Stegemoeller, Calvin L., 5,006,034, Cl. 414-555.000
Soliman, Mohamed Y., Kuhlman, Robert D., and Poulsen, Don K., 5,005,643, Cl. 166-250.000

Hamachi, Hishashi, and Harada, Tamotsu, to Pioneer Electronic Corporation. Automatic changer for digital audio cassette tape player. 5,006,940, Cl. 360-92.000

Hamada, Akiyoshi *See—*
Murakami, Masanori; Hamada, Akiyoshi, Yagoto, Mitsutoshi, and Mori, Shinichi, 5,006,874, Cl. 354-212.000

Hamada, Hiroshi, Takamatsu, Toshiaki; and Kimura, Naofumi, to Sharp Kabushiki Kaisha. Color liquid-crystal display apparatus with rectilinear arrangement. 5,006,840, Cl. 340-784.000

Hamada, Tetsurou *See—*
Takano, Masami, Hamada, Tetsurou, and Masuda, Katsuhiko, 5,005,685, Cl. 192-58.00B

Hamann, Jens, and Vogt, Hartmut, to Siemens Aktiengesellschaft. Method and apparatus for preventing a current collapse in a phase not participating in the commutation of a three-phase, block-current supplied synchronous machine. 5,006,775, Cl. 318-723.000

Hamano, Hideo *See—*
Yoshinaka, Toshio, Hamano, Hideo, Minami, Hiroshi, and Ogawa, Shinji, 5,006,098, Cl. 475-86.000

Hamashima, Shigeki; Koseto, Masaru; and Nomura, Shoji, to Fujitsu Limited. Multielement infrared detector for thermal imaging. 5,006,711, Cl. 250-349.000

Hamel, James A. *See—*
Douglas, Donald D., and Hamel, James A., 5,006,109, Cl. 604-26.000

Hamer, R. Richard L., Freed, Brian, and Allen, Richard C., to Hoechst-Roussel Pharmaceuticals Inc. Alkylamino- and alkylamino alkyl diarylketones. 5,006,563, Cl. 514-646.000

Hamilton, Alistair R. *See—*
Kallin, Fredrik L. N., Hamilton, Alistair R., and Luckhurst, Graham, 5,006,960, Cl. 361-390.000

Hamilton, Christopher T. *See—*
Markley, Lowell D., Hamilton, Christopher T., Swisher, Beth A., and Secor, Jacob, 5,006,159, Cl. 71-98.000

Hamilton, Richard P. *See—*
Sullivan, Shelby F., Whitehouse, Harper J.; and Hamilton, Richard P., 5,007,030, Cl. 367-153.000

Hamlin Transmission Corporation *See—*
Leonard, George H., 5,006,094, Cl. 474-101.000

Hammond, Kevin R. *See—*
Markow, Paul A., Hammond, Kevin R., and Hutchings, Donald E., 5,007,035, Cl. 368-118.000

Hammond, Milton L. *See—*
Zambias, Robert A., and Hammond, Milton L., 5,006,549, Cl. 514-444.000.

Hammond, Russell E., and Henry, John L., to United States of America, Navy. Sea water battery power converter. 5,006,972, Cl. 363-24.000

Hanaki, Hironobu. *See—*
Fujimura, Hideo; and Hanaki, Hironobu, 5,006,502, Cl. 503-227.000

Hanamura, Takeo *See—*
Usui, Mitsuji; Hanamura, Takeo, and Kurihara, Junichi, 5,006,188, Cl. 156-245.000

Hancock, Michael P. *See—*
Davis, Billy F.; Hancock, Michael P., and Hayes, Scott L., 5,005,694, Cl. 206-3.000

Handa, Balraj K.: *See—*
Broadhurst, Michael J.; Handa, Balraj K.; Johnson, William H., Lawton, Geoffrey; and Machin, Peter J., 5,006,651, Cl. 540-463.000.

Handa, Kenichi, to Sanshin Kogyo Kabushiki Kaisha. Shift device for marine propulsion. 5,006,084, Cl. 440-75.000.

Handke, Guenther, and Lemke, Hans-Juergen, to Messerschmitt-Boelkow-Blohm GmbH. Robot type apparatus for performing a plurality of operations on a work piece. 5,006,694, Cl. 219-121.600

Handler, Albert W., deceased, by Handler, Bernice, legal representative, and Handler, Lawrence F. Exophthalmometer light, and methods of constructing and utilizing same. 5,005,966, Cl. 351-221.000

Handler, Bernice, legal representative *See—*
Handler, Albert W., deceased, Handler, Bernice, legal representative; and Handler, Lawrence F., 5,005,966, Cl. 351-221.000

Handler, Lawrence F. *See—*
Handler, Albert W., deceased; Handler, Bernice, legal representative, and Handler, Lawrence F., 5,005,966, Cl. 351-221.000

Handmer, Charles, to Powerboard Australia Pty Limited. Recreational water vehicle. 5,005,506, Cl. 114-270.000.

Hanna, Charles F. *See—*
Khalil, Omar S.; Hanna, Charles F.; Zurek, Thomas F.; and Grigalauski, Denise A., 5,006,309, Cl. 422-56.000

Hara, Shigeyoshi; Endo, Zen-ichiro, and Mera, Hiroshi, to Hercules Incorporated. Metathesis polymerized copolymer. 5,006,616, Cl. 526-75.000

Hara, Tetsuro: *See—*
Tokuhara, Chikara, and Hara, Tetsuro, 5,006,088, Cl. 445-27.000

Hara, Tsutomu. Athletic equipment for rehabilitation. 5,005,831, Cl. 272-136.000

Harada, Takashi *See—*
Sakamoto, Seiji; Kawaguchi, Chikakazu, Meguro, Yoshio; Harada, Takashi, and Takisawa, Toshifumi, 5,006,589, Cl. 524-430.000

Harada, Tamotsu *See—*
Hamachi, Hishashi, and Harada, Tamotsu, 5,006,940, Cl. 360-92.000

Harada, Yoshiyasu: *See—*
Mori, Nobufumi; Ohnishi, Masahiro, Miyahara, Junji; Oikawa, Tetsuo, and Harada, Yoshiyasu, 5,006,707, Cl. 250-311.000

Harada, Yuichi, to Brother Kogyo Kabushiki Kaisha. Typewriter. 5,006,003, Cl. 400-697.100

Harada, Yusuke, to Oki Electric Industry Inc., Co. Making a semiconductor device with contact holes having different depths. 5,006,484, Cl. 437-192.000

Haraguchi, Masanori: *See—*
Tanaka, Yutaka; and Haraguchi, Masanori, 5,007,024, Cl. 365-207.000

Harden, Bonnie J. Method and apparatus for dispersing cremated remains. 5,005,784, Cl. 244-136.000

Hardman Incorporated *See—*
Koehler, Harold W., Anderson, Alfred J., and Finelli, Alfred A., 5,005,731, Cl. 222-54.000

Harissis, Peter J. *See—*
Edwards, Evan A., Harissis, Peter J., and Menon, Krishna S., 5,006,246, Cl. 210-264.000

Harle, William. Anti-torque coupling. 5,005,875, Cl. 285-73.000

Harless, William G. Audiovisual system for simulation of an interaction between persons through output of stored dramatic scenes in response to user vocal input. 5,006,987, Cl. 364-419.000

Harmon, Lonnie R., to Steadley Company. Spring element for a foundation unit and foundation unit employing a spring element. 5,005,809, Cl. 267-103.000

Harmony, Daniel C. *See—*
Acker, Loren C., and Harmony, Daniel C., 5,006,119, Cl. 606-27.000.

Harold Simpson, Inc.. *See—*
Simpson, Harold G., and Bindra, Charanjit S., 5,005,323, Cl. 52-90.000.

Harp, Hans-Jurgen *See—*
Manusch, Cristoph; and Harp, Hans-Jurgen, 5,006,184, Cl. 156-577.000

Harper, Daniel R. *See—*
Edwards, John W., Harper, Daniel R., and McNew, Quinton B., 5,005,921, Cl. 305-35.0EB.
Edwards, John W.; Harper, Daniel R., and McNew, Quinton B., 5,005,922, Cl. 305-35.0EB.

Harrell, William C. *See—*
Knavish, Leonard A., and Harrell, William C., 5,006,144, Cl. 65-134.000

Harris, John H., III. Hose holding fixture. 5,005,790, Cl. 248-75.000

Harris, Ralph Leslie: *See—*
Hoffmann, David, 5,005,664, Cl. 180-287.000

Harrison, Pamela J.; and Hein, Richard D., to GenCorp Inc. Resilient rolling torus for a load-cushioning device. 5,005,811, Cl. 267-220.000

Hart, James E., and McKay, Albert A., to American Standard Inc. Empty/load changeover valve for railway car. 5,005,915, Cl. 303-22.200

Hartley Associates Inc *See*—
Kelleher, Barbara J., Walsh, Michael J and Cone, Richard F., 5,005,234, Cl. 5-94.000

Hartman, David R, Jutte, Ralph B, Beaver, Terry R and Hill, Homer G, to Owens-Corning Fiberglas Corporation Process for forming flat plate ballistic resistant materials 5,006,293, Cl 264-137.000

Hartmann, Gyorgy Watch band or bracelet closure 5,005,268, Cl. 24-652.000.

Haruta, Masahiro; Matsuda, Hiroshi, Munakata, Hirohide and Nishimura, Yukuo, to Canon Kabushiki Kaisha Medium and process for image formation 5,006,446, Cl 430-270.000

Hasegawa, Hirofumi: *See*—
Hashimoto, Kaoru, Kawaguchi, Toshikazu and Hasegawa, Hirofumi, 5,006,934, Cl. 358-296.000

Haser Company Limited *See*—
Wells, Alan A, 5,006,060, Cl 431-1.000

Hashimoto, Kaoru, and Ideyama, Hiroyuki, to Minolta Camera Kabushiki Kaisha, Electrophotographic copying apparatus with book mode magnification capability 5,006,895, Cl 355-243.000

Hashimoto, Kaoru; Kawaguchi, Toshikazu, and Hasegawa, Hirofumi, to Minolta Camera Kabushiki Kaisha Copying machine capable of storing image data 5,006,934, Cl. 358-296.000

Hashizume, Tamotsu *See*—
Kawase, Hideyuki; Sahashi, Noboru; and Hashizume, Tamotsu, 5,006,143, Cl. 65-43.000.

Haskell, Barry G., to AT&T Bell Laboratories Data compression using block list transform 5,007,102, Cl. 382-56.000

Hasker, Jan; Crombeen, Jacobus E., Niessen, Anton K., and Stoffelen, Henricus J. H., to U S Philips Corporation Scandate cathode exhibiting scandium segregation 5,006,753, Cl 313-346.00R

Hasslin, Hans W, and Iwanzik, Wolfgang P, to Ciba-Geigy Corporation. Herbicidal composition 5,006,161, Cl 71-118.000

Hatakeyama, Yasuhiko; and Aoyama, Tomoo, to Hitachi, Ltd and Hitachi Computer Engineering Co., Ltd Data processing system 5,007,005, Cl. 364-521.000.

Hatano, Sakae, Takada, Yoshiharu; Kainuma, Kiyokazu, Kanematsu, Isao, Asano, Kazuo, Yoshida, Hisashi, and Mori, Yoshinori, to Yamazaki Mazak Corporation. Machine tool with grinding function and truing/dressing method of grinding stone using it 5,006,685, Cl 219-69.200

Hatfield, Charles S Unitary animal leash and collar 5,005,527, Cl 119-109.000

Hattori, Hitoshi, to Kabushiki Kaisha Toshiba Rotary two-cylinder compressor with delayed compression phases and oil guiding bearing grooves 5,006,051, Cl. 418-60.000

Hattori, Yoshihiro: *See*—
Fukui, Kazuyuki, Hattori, Yoshihiro, and Hada, Yoshinobu, 5,005,517, Cl 118-689.000

Hattori, Yuji *See*—
Itoh, Hiroshi; Sugaya, Masami, Soga, Yoshinobu, Morisawa, Kunio; Habuchi, Ryoji, Kouno, Katsumi, and Hattori, Yuji, 5,006,093, Cl. 474-28.000.

Hattori, Yutaka, to Brother Kogyo Kabushiki Kaisha Magneto-optical data reading apparatus 5,007,021, Cl 365-122.000

Hauer, Werner Security module to preclude unauthorized users to operate motor driven equipment and to protect valuable parts of the motor from unauthorized exchange 5,006,843, Cl. 340-825.310

Haueter, Donald F, Jr. Load carrying pole for outdoorsmen 5,005,845, Cl. 280-1.500

Haugen, Ronald E, and Murphy, David T, to VIX Design Products, Inc Rack for body of pickup truck, 5,005,892, Cl. 296-3.000

Havinga, Edsko E. *See*—
Meijer, Egbert W., Ten Hoeve, Wolter, Nijhuis, Sjef; Rikken, Gerardus L. J. A., and Havinga, Edsko E., 5,006,729, Cl 307-425.000

Hawkins, William G., Drake, Donald J., and O'Neill, James F., to Xerox Corporation Fabricating method for silicon devices using a two step silicon etching process 5,006,202, Cl. 156-643.000.

Haws, Henry H Drawer comb holder, 5,005,924, Cl. 312-237.000

Hayakawa, Shigeru: *See*—
Fukumoto, Ryoichi, Hayakawa, Shigeru, and Torii, Nozomu, 5,005,882, Cl. 292-216.000

Hayakawa, Toshiro, to Eastman Kodak Company Crosstalk preventing laser diode array 5,006,907, Cl. 357-17.000

Hayashi, Chisao *See*—
Kuno, Toshitaka; Koide, Mitsuo; Nakano, Masaru, Hayashi, Chisao; Kato, Yoshito, and Ishiguro, Yasuo, 5,006,999, Cl 364-513.000

Hayashi, Hiroshi *See*—
Yukimoto, Koji; and Hayashi, Hiroshi, 5,005,688, Cl. 194-206.000

Hayashi, Takayuki; and Yoshihara, Hideo, to Brother Kogyo Kabushiki Kaisha Sheet feed device having a sheet cassette locking mechanism 5,005,818, Cl 271-107.000

Hayashi, Yoshinori *See*—
Iijima, Kenzaburou, and Hayashi, Yoshinori, 5,007,057, Cl 371-66.000

Hayes, Cecil L., Cheung, Derek T, and Fetterman, Harold R, to Rockwell International Corporation. Millimeter wave power generator, 5,007,058, Cl 372-4.000

Hayes Microcomputer Products, Inc *See*—
Inskeep, Jeffrey, 5,007,020, Cl 364-900.000

Hayes, Scott L.: *See*—
Davis, Billy F., Hancock, Michael P., and Hayes, Scott L., 5,005,694, Cl 206-3.000

Hayman, Lawrence F., to Parker Hannifin Corporation Quick connect/disconnect fluid coupling 5,005,877, Cl. 285-315.000

Head Sportgerate Gesellschaft m b H. & C OHG *See*—
Lampl, Heinz, 5,005,853, Cl 280-610.000

Hecker, Jack D Apparatus for modifying cables and products thereof 5,005,611, Cl 146-147.000

Hector, Richard F, Schaller, Klaus, Moeschler, Heinrich F and Plempel, Manfred, to Miles Inc Antimycotic compositions of nikkomycin compounds and azole antimycotics 5,006,513, Cl. 514-43.000

Hedengren, Kristina H V, Hurley, Donna C, and Young, John D, to General Electric Company Eddy current imaging apparatus and method using phase difference detection 5,006,800, Cl 324-233.000

Hegner, Frank, Dittrich, Gerhard; and Klahn, Thomas, to Endress u Hauser GmbH u Co Pressure sensor and method for the manufacture thereof, 5,005,421, Cl. 73-72.000

Heidelberger Druckmaschinen AG *See*—
Blaser, Peter T, 5,006,719, Cl. 250-560.000
Max, Reinhold, and Filsinger, Karl-Heinz, 5,005,822 C 271-213.000.

Heilman, Robert J., to Continental White Cap, Inc. Plastic cap with breakaway tamper band and method of forming same 5,005,720, C 215-252.000.

Heimbeck, Hans J., to Med Inventio AG Relay lens system with four optical elements in symmetrical arrangement 5,005,960, Cl 350-573.000

Hein, Richard D *See*—
Harrison, Pamela J., and Hein, Richard D., 5,005,811, Cl 267-220.000

Heiner, Nicolaas, to U S Philips Corporation Device for providing a flux layer on a printed board 5,005,766, Cl 239-214.000

Heinzelmann, Karl Fritz *See*—
Furer, Gerd, Heinzelmann, Karl-Fritz, and Osterloff, Kurt, 5,005,437, Cl 74-467.000

Heitmann, Ulrich *See*—
Noonenbruch, Heinz-Gerd, Heitmann, Ulrich, and Bormann, Heinrich, 5,006,564, Cl 521-54.000

Heitz, Walter *See*—
Spies, Manfred and Heitz, Walter, 5,006,636, Cl. 528-320.000

Hekele, Wilhelm *See*—
Lebisch, Helmut; Basel, Rainer, Fuchs, Georg, Dietmar, Hermann Wipfelder, Ernst, and Hekele, Wilhelm, 5,006,055, Cl 425-2.000

Helbig, Joachim, and Classen, Hans G, to Verla-Pharm Arzneimittelfabrik Apotheker H.J.V. Ehrlich GmbH & Co KG Method for the prophylaxis of cardiac infarctions and the prevention of reinfarctions, 5,006,516, Cl. 514-163.000

Helm, Winfried *See*—
Barth, Walter, Borst, Erich, Helm, Winfried and Stabler, Manfred, 5,005,321, Cl. 51-170.00T

Helmreich, Gerhard *See*—
Bransky, Olaf; Wiede, Guenter, Stein, Fritz-Dieter, and Helmreich, Gerhard, 5,007,090, Cl. 381-60.000

Helsley, Grover C Tegeler, John J., and Shoger, Kirk D., to Hoechst Roussel Pharmaceuticals Inc 5,6-dihydro(1H-indolo(3,2-C)quinoline-6,4'-piperidines) and related compounds which are useful for treating pain, psychosis or convulsions 5,006,531, Cl 514-278.000.

Hemmerich, Rainer *See*—
Zolk, Ralf, Kerth, Juergen, and Hemmerich, Rainer, 5,006,620, Cl 526-128.000

Henderson, Steven and Perry, Robert M., to British Steel Corporation Method and apparatus for cooling a flow of molten material 5,005,632, Cl 164-122.000

Henkel Kommanditgesellschaft auf Aktien *See*—
Wahle, Bernd, Herold, Claus-Peter, Zoellner, Wolfgang, Schiefer stein, Ludwig, and Oberkobusch, Doris, 5,006,621 Cl 526-262.000

Henrissat, Bernard *See*—
Schwarz, William M. Marchessault, Robert H., Alexandru, Lupu and Henrissat, Bernard, 5,006,170, Cl. 106-20.000

Henry, John L. *See*—
Hammond, Russell E and Henry, John L., 5,006,972, Cl 363-24.000

Hensens, Otto D *See*—
Liam, Yiu-kuen T., Hensens, Otto D Chang, Raymond S Schwartz, Cheryl D and Zink, Deborah L., 5,006,466, Cl 435-120.000

Herbst, Joseph A., Owen, Hartley, and Schipper, Paul H, to Mobil Oil Corporation Multi-component catalyst and a process for catalytic cracking of heavy hydrocarbon feed to lighter products 5,006,497, Cl. 502-67.000

Hercules Incorporated: *See*—
Hara, Shigeyoshi, Endo, Zen-ichiro; and Mera, Hiroshi, 5,006,616, Cl. 526-75.000
Schroeder, Richard B, 5,005,477, Cl 101-415.100

Heren, Lawrence P., to L R Nelson Corporation Slitted dirt seal for inground sprinkler heads, 5,005,767, Cl 239-288.000

Herfurth, Eike, to Elkem a/s Spray nozzle 5,005,768, Cl. 239-417.000

Hergeth Hollingsworth GmbH *See*—
Pinto, Akiva, and Lasenga, Werner, 5,005,261, Cl 19-105.000

Janssen Pharmaceutica N.V *See—*
Janssens, Frans E., Torremans, Joseph L. G., and Diels, Gasto S. M., 5,006,527, Cl. 514-253.000.
Janssens, Frans E., Torremans, Joseph L. G., and Diels, Gasto S. M., to Janssen Pharmaceutica N.V. Pharmacologically active N-(4-piperidinyl) bicyclic condensed 2-imidazolamine derivatives 5,006,527, Cl. 514-253.000
Japan Electronic Control Systems Co., Ltd *See—*
Uchikawa, Akira, 5,006,221, Cl. 204-426.000
Japan Tobacco Co. *See—*
Itoh, Kazuo, Naoi, Yoshitake, Matsushita, Hajime, Ebata, Takashi; and Kawakami, Hiroshi, 5,006,646, Cl. 536-23.000
Jasinski, Raymond, Fletcher, Philip, and Vercaemer, Claude, to Schlumberger Technology Corporation Monitoring drilling mud composition using flowing liquid junction electrodes 5,005,406, Cl. 73-153.000
Jasper, Louis J., Jr., Weiner, Maurice, and Bovino, Lawrence J., to United States of America, Army, Laser controlled semiconductor armature for electromagnetic launchers 5,005,462, Cl. 89-8.000.
Jenkins, Anthony, and Stephens, Peter W., to Ion Track Instruments, X-ray diffraction inspection system 5,007,072, Cl. 378-88.000.
Jenkins, Lloyd T. Low-power safety flasher 5,006,971, Cl. 362-252.000.
Jennewein, Manfred A. and Ballweg, Achim, to Jennewein, Manfred A. Apparatus for suspending garments on hangers 5,005,691, Cl. 198-465.400.
Jennings, Alfred R., Jr., and Smith, Roger C., to Mobil Oil Corporation Method for enhancing heavy oil production using hydraulic fracturing 5,005,645, Cl. 166-280.000
Jennings, Kevin: *See—*
D'Aoust, Robert, Cording, Robert B., Grosse, Debora Y., Jennings, Kevin, Krebs, Stephen R., Reasoner, George E., Jr., Smith, Gerald R., and Williams, David C., 5,007,100, Cl. 382-49.000
Jenoptik Jena GmbH *See—*
Beltz, Dietmar, Nehler, Hans-Juergen, and Rozek, Werner, 5,006,981, Cl. 364-200.000
Jensen, Bent T. *See—*
Fossing, Michael; and Jensen, Bent T., 5,006,031, Cl. 414-458.000
Jensen, Jens P., to A/S Niro Atomizer Apparatus for crystallizing whey 5,006,204, Cl. 159-3.000
Jensen-Korte, Uta *See—*
Fischer, Reiner, Jensen-Korte, Uta, Kunisch, Franz, Marhold, Albrecht, Ooms, Pieter, Schallner, Otto; Santel, Hans-Joachim, Schmidt, Robert R., Krauskopf, Birgit, and Strang, Harry, 5,006,148, Cl. 71-72.000

Jensen, Laurel H. *See*—
Lundahl, E. Cordell, and Jensen, Laurel H., 5,005,342, Cl. 56-10.200

Jensen, Raliegh J., to Ace Company, Inc. Finger joint cutter head. 5,005,619, Cl. 144-230.000

Jensen, Randy M., to Honeywell Inc. Acoustic alert sensor. 5,007,032, Cl. 367-136.000

Jensen, William S. and Ng, David, to Barry Wright Corporation. Inertia force generating device. 5,005,439, Cl. 74-574.000

Jeol Ltd. *See*—
Mori, Nobufumi, Ohnishi, Masahiro, Miyahara, Junji, Oikawa, Tetsuo, and Harada, Yoshiyasu, 5,006,707, Cl. 250-311.000

Jerzewski, Robert L., Wong, Thomas M., Gryziewicz, Lewis J., Jain, Nemchand B., and Thakur, Ajit B., to E. R. Squibb & Sons, Inc. Fosinopril tablet formulations. 5,006,344, Cl. 424-465.000

Jesse, John F. *See*—
Tyrrell, Paul C., Backes, Johannes B., McCormick, David D., and Jesse, John F., 5,007,103, Cl. 219-363.000

Jidosha Kiki Co., Ltd. *See*—
Takaku, Hitoshi, 5,005,464, Cl. 91-6.000

Jimbo, Keiji, Yasui, Yuuji, and Taninaga, Sigeru, to Kanebo Limited. Make-up case. 5,005,697, Cl. 206-235.000

Jinbo, Shunji. *See*—
Yoshida, Hiroshi, Shibazaki, Mitsuhiro, Kubo, Hiroaki, and Jinbo, Shunji, 5,006,017, Cl. 405-263.000

Jodel Medical Products, Inc. *See*—
Eldridge, John D., Jr., and Morgan, Mary A., 5,005,590, Cl. 128-849.000

John Kelly (Lasers) Limited. *See*—
Johnson, David M., 5,005,652, Cl. 172-1.000

Johnson, David. *See*—
Ebersole, Ronald J., Johnson, David, Budde, David, Myers, Mark S., and Bier, Gerhard, 5,006,982, Cl. 364-200.000

Johnson, David M., to John Kelly (Lasers) Limited. Method of producing a contoured work surface. 5,005,652, Cl. 172-1.000

Johnson, Donald B. *See*—
Matyas, Stephen M., Johnson, Donald B., Le, An V., Martin, William C., Prymak, Rostislaw, and Wilkins, John D., 5,007,089, Cl. 380-49.000

Johnson Electric S A. *See*—
Strobl, Georg, and Wong, Ben T., 5,006,742, Cl. 310-88.000

Johnson Filtration Systems Inc. *See*—
Anderson, Thomas A., Kalar, Richard G., Markfelt, Reinhold S. and Wagner, Walter R., 5,006,228, Cl. 209-365.300

Johnson, Neil H., to Detroit Stoker Company. Method of desulfurizing combustion gases. 5,006,323, Cl. 423-244.000

Johnson, William H. *See*—
Broadhurst, Michael J., Handa, Balraj K., Johnson, William H., Lawton, Geoffrey, and Machin, Peter J., 5,006,651, Cl. 540-463.000

Johnston, Cesar A. *See*—
Chao, Hung-Hsiang J., and Johnston, Cesar A., 5,007,070, Cl. 375-118.000

Johnston, Richard. *See*—
Shepley, Pete Johnston, Richard, and Smith, Allan F., 5,005,554, Cl. 124-24.100

Jonas, Friedrich, and Merten, Rudolf, to Bayer Aktiengesellschaft. Process for the preparation of polyhydantoins which can be processed thermoplastically. 5,006,641, Cl. 528-328.000

Jones, Arthur A. Machine for exercising and/or testing muscles of the lower trunk. 5,005,830, Cl. 272-134.000

Jones, Eric M., to Karl Storz Endoscopy-America, Inc. Dimmer for fiber optic light transmission systems. 5,006,965, Cl. 362-32.000

Jones, Floyd B. Spin-on oil filter adaptor for four cylinder continental aircraft engines. 5,006,237, Cl. 210-168.000

Jones, Gerald L. Swivel grip arrangement for knives. 5,005,292, Cl. 30-298.000

Jones, Harold D. Pipe hanger. 5,005,789, Cl. 248-58.000

Jones, John, and Uccellini, Rinaldo G., to Yale Materials Handling Limited. Power assisted steering for vehicles. 5,005,659, Cl. 180-65.100

Jones, Keith E. *See*—
Gleason, K. Reed, and Jones, Keith E., 5,006,793, Cl. 324-158.00P

Jones, Norman S. *See*—
Goldberg, Edward M., Bettencourt, Daniel, Jr., Tosti, James C., Jr., and Jones, Norman S., 5,005,478, Cl. 101-425.000

Jones, Reginald T. *See*—
Cooper, Graham P., and Jones, Reginald T., 5,006,442, Cl. 430-168.000

Jones, Robert L., and Wilson, Norman H., to National Research Development Corporation. Prostaglandins. 5,006,539, Cl. 514-357.000

Jones, William C. *See*—
Trundle, Mark H., and Jones, William C., 5,006,302, Cl. 376-260.000

Jonsson, Erik, and Tornblom, Lars, to AB Asea-Atom. Sealing device for nuclear power reactor. 5,006,300, Cl. 376-203.000

Jordan, Willie W., to Abbott Laboratories. Vial seal. 5,005,721, Cl. 220-23.400

Jow, Wen-Yuh, to Mingyen Electronics Industry Co., Ltd. Electrically-operated gear rotor pump. 5,006,048, Cl. 417-410.000

Joyner Engineers and Trainers, Inc. *See*—
Lexa, Anthony F., 5,006,301, Cl. 376-259.000

Judy, James E., Jr. *See*—
Gal, Laszlo V., Judy, James E., Jr., and Prentiss, Kenneth C., 5,006,794, Cl. 324-158.00R

Julien, Gerald J., and Robinson, Steven P., to Boeing Company, The. Method and apparatus for sensing and damping vibration. 5,005,678, Cl. 188-378.000

Jundt, Larry O., to Fisher Controls International, Inc. Process control terminal. 5,006,976, Cl. 364-184.000

Jung, Johann. *See*—
Seele, Rainer, Kober, Reiner, Karbach, Stefan, Sauter, Hubert, Ammermann, Eberhard, Lorenz, Gisela, Rademacher, Wilhelm, and Jung, Johann, 5,006,152, Cl. 71-92.000

Jung, Michael. *See*—
Latz, Rudolf, Scherer, Michael, Geisler, Michael, and Jung, Michael, 5,006,219, Cl. 204-298.160

Jung, Tae S. *See*—
Hwang, Sang K., Jung, Tae S., and Choi, Kyu H., 5,007,025, Cl. 365-226.000

Junkers, John K. Torque wrench. 5,005,447, Cl. 81-57.390

Just, Melitta. *See*—
Schonafinger, Karl, Beyerle, Rudi, Just, Melitta, Bohn, Helmut, and Ostrowski, Jorg, 5,006,540, Cl. 514-361.000

Justus, Gyula. *See*—
Kiss, Laszlo, Justus, Gyula, Zsuppan, Jozsef, and Knollmar, Tibor, 5,006,149, Cl. 71-81.000

Jutte, Ralph B. *See*—
Hartman, David R., Jutte, Ralph B., Beaver, Terry R., and Hill, Homer G., 5,006,293, Cl. 264-137.000

Jutting, Wolfgang. *See*—
Bohm, Harald, Jutting, Wolfgang, and Bretting, Jork, 5,006,427, Cl. 429-101.000

Kabushiki Kaisha Hokkaido Nissin. *See*—
Emura, Tatuo, and Ohba, Kiyoshi, 5,006,350, Cl. 426-46.000

Kabushiki Kaisha Imasen Denki Seisakusho. *See*—
Suzuki, Yoshio, Umeda, Kaoru, and Kitoh, Norimasa, 5,005,906, Cl. 297-362.000

Kabushiki Kaisha Kobe Seiko Sho. *See*—
Miyaoka, Satoshi, 5,005,466, Cl. 91-420.000

Kabushiki Kaisha Komatsu Seisakusho. *See*—
Nire, Takashi, and Watanabe, Takehito, 5,006,365, Cl. 427-66.000
Ota, Kazuo, 5,005,929, Cl. 350-6.500

Kabushiki Kaisha SG. *See*—
Matsuki, Yuji, and Ichikawa, Wataru, 5,006,798, Cl. 324-207.170

Kabushiki Kaisha Showa Seisakusho. *See*—
Satoh, Yutaka, and Takeuchi, Yoshinori, 5,005,859, Cl. 280-721.000

Kabushiki Kaisha Tokai-Rika-Denki-Seisakusho. *See*—
Mori, Shinji, Buma, Kozi, and Shinto, Hiroaki, 5,005,860, Cl. 280-731.000

Kabushiki Kaisha Tominaga Jyushi Kogyosho. *See*—
Tominaga, Kazutoshi, 5,006,238, Cl. 210-169.000

Kabushiki Kaisha Toshiba. *See*—
Aomori, Kohkichi, 5,005,558, Cl. 128-4.000
Goto, Junkei, and Iida, Tetsuya, 5,006,852, Cl. 341-155.000
Hattori, Hitoshi, 5,006,051, Cl. 418-60.000
Hirahara, Shuzo, and Higuchi, Kazuhiko, 5,006,870, Cl. 346-76.0PH

Kakimoto, Norihiro, Kumano, Kazuo; and Nakamura, Kunie, to Asai Germanium Research Institute Co., Ltd. Agent for improving reduced functions of organs caused by inhibited blood circulation. 5,006,553, Cl. 514-492.000

Kakinuma, Hiromi; and Iida, Hideo, to Taiyo Yuden Co., Ltd. Scanning circuit device with sawtooth voltage source. 5,006,702, Cl. 250-208.100.

Kalar, Richard G. *See*—
Anderson, Thomas A., Kalar, Richard G.; Markfelt, Reinhold S., and Wagner, Walter R., 5,006,228, Cl. 209-365.300.

Kallin, Fredrik L. N. Hamilton, Alistair R.; and Luckhurst, Graham, to NCR Corporation. Means for routing connection cables out of a table top terminal. 5,006,960, Cl. 361-390.000.

Kamahori, Masao. *See*—
Watanabe, Yoshio; Taki, Mamoru; Miura, Junkichi; Kamahori, Masao, Miyagi, Hiroyuki; Matsumura, Yasuhide; and Kanetomo, Masafumi, 5,005,434, Cl. 73-864.210.

Kamata, Masamoto. *See*—
Masuda, Sadakazu, Fujita, Fumio; Murakami, Tadayoshi; Yoshino, Masahiko, Yagi, Ryuichi; and Kamata, Masamoto, 5,006,181, Cl. 148-111.000

Kambayashi, Shigemi. *See*—
Endo, Misao; and Kambayashi, Shigemi, 5,005,897, Cl. 296-192.000

Kamei, Yoshio. *See*—
Ishizuka, Masaru; Yokono, Yasuyuki; Matsuura, Asako; Kamei, Yoshio; Ohashi, Hiromichi; Kitagawa, Mitsuhiko, Sasaki, Tomiya, and Monma, Shigeki, 5,006,921, Cl. 357-74.000.

Kamerling, Marc A.. *See*—
Phillips, Roger W.; Spellman, Vernon C.; Gossett, Wayne L.; Kamerling, Marc A., Coombs, Paul G.; Todd, David W.; and Silver, Steven A., 5,005,719, Cl. 215-230.000.

Kamino, Hiroaki. *See*—
Maruyama, Fumio, Suyama, Tomio, Kamino, Hiroaki, Suyama, Koji, Kuwahara, Tokihiro; and Nagata, Osamu, 5,006,767, Cl. 318-103.000.

Kaminski, Joan M.. *See*—
Andress, Harry J.; Horodysky, Andrew G.; and Kaminski, Joan M., 5,006,272, Cl. 252-49.600.

Kamiya, Kazuo. *See*—
Sakakibara, Shiro; Imai, Norio, Kondo, Hidehiro; and Kamiya, Kazuo, 5,005,442, Cl. 74-866.000.

Kamiya, Takashi; Naito, Toshihiko, Negi, Shigeto; Komatu, Yuuki; Kai, Yasunobu, Nakamura, Takaharu; Sugiyama, Isao, Machida, Yoshimasa; Nomoto, Seiichiro; Kitoh, Kyosuke; Katsu, Kanemasa; and Yamauchi, Hiroshi, to Eisai, Co. 3-propenylcephem derivative. 5,006,649, Cl. 540-222.000.

Kampfer, Helmut. *See*—
Patzold, Walter, and Kampfer, Helmut, 5,006,455, Cl. 430-571.000

Kanai Juyo Kogyo Company, Limited. *See*—
Oda, Takumi, 5,005,260, Cl. 19-104.000.

Kanai, Masahiro; Aoike, Tatsuyuki, Matsuda, Koichi; and Kawakami, Soichiro, to Canon Kabushiki Kaisha. Pin heterojunction photovoltaic elements with polycrystal GaP (H,F) semiconductor film. 5,006,180, Cl. 136-258.000.

Kanai, Tsutomu. *See*—
Ohno, Tadayoshi; Nagato, Hitoshi; and Kanai, Tsutomu, 5,005,993, Cl. 400-120.000.

Kanamori, Iwao; and Okabe, Minoru, to Olympus Optical Co., Ltd. Objective lens system for endoscopes. 5,005,957, Cl. 350-432.000.

Kanamoto, Yoshifumi. *See*—
Satoh, Toshio; Matsumoto, Hitoshi; Kakegawa, Hisao; Kato, Yoshiko; Riku, Juichi, Yoshinaga, Junji; and Kanamoto, Yoshifumi, 5,006,548, Cl. 514-427.000.

Kanatani, Yoshiharu. *See*—
Fujioka, Yosihide; Ohba, Toshihiro; Kanatani, Yoshiharu; and Uede, Hisashi, 5,006,838, Cl. 340-781.000.

Kanazawa, Yasunori. *See*—
Sakemoto, Akito; Watanabe, Hitoshi; and Kanazawa, Yasunori, 5,007,039, Cl. 369-116.000.

Kaneaki, Tetsuhiko; Oda, Mikio; Nuriya, Kozo; and Tani, Yasunori, to Matsushita Electric Industrial Co., Ltd. Analog-to-digital converting system. 5,006,851, Cl. 341-155.000.

Kanebo Limited. *See*—
Jimbo, Keiji; Yasui, Yuuji; and Taninaga, Sigeru, 5,005,697, Cl. 206-235.000.

Kaneda, Naoya; Wada, Hiroyuki, Hirasawa, Masahide; and Suda, Hirofumi, to Canon Kabushiki Kaisha. Lens position control device. 5,005,956, Cl. 350-429.000.

Kaneko, Masaharu; and Nakajima, Takanori, to Mitsubishi Kasei Corporation. Liquid crystal composition and display element using the same. 5,006,276, Cl. 252-299.100.

Kanematsu, Isao. *See*—
Hatano, Sakae; Takada, Yoshiharu; Kainuma, Kiyokazu; Kanematsu, Isao; Asano, Kazuo, Yoshida, Hisashi; and Mori, Yoshinori, 5,006,685, Cl. 219-69.200.

Kanetomo, Masafumi. *See*—
Watanabe, Yoshio; Taki, Mamoru; Miura, Junkichi; Kamahori, Masao; Miyagi, Hiroyuki; Matsumura, Yasuhide; and Kanetomo, Masafumi, 5,005,434, Cl. 73-864.210.

Kang, Sung K.; Palmer, Michael J., Reiley, Timothy C., and Topa, Robert D., to International Business Machines Corporation. Thermocompression bonding in integrated circuit packaging. 5,006,917, Cl. 357-70.000.

Kano, Takenori. *See*—
Takase, Isao; Takemoto, Haruki; Tatsuta, Mitsugu; Maseki, Shinobu; Kano, Takenori; Yokoyama, Fumitomo; and Niimi, Mamoru, 5,006,102, Cl. 475-282.000.

Kanou, Hideki. *See*—
Miyamoto, Osamu; Kanou, Hideki; Nakamura, Kazuo; Imai, Takeshi, and Nishida, Kenichi, 5,006,829, Cl. 340-459.000.

Kao Corporation. *See*—
Kawai, Michio; Tanaka, Sadahiro; and Osanai, Osamu, 5,005,975, Cl. 356-237.000.

Kaplan, Stanley. Strip-out preventing anchoring assembly and method of anchoring. 5,006,023, Cl. 411-17.000.

Kaplan, Stuart L.; and Goss, John R., to Shell Oil Company. Method of synchronizing flowering in plants. 5,006,154, Cl. 71-92.000.

Kar, Kishore K., and Nowak, David J., to Dow Chemical Company, The. Filter apparatus and method for removing solids from fluids. 5,006,265, Cl. 210-741.000.

Karafian, Maxim; and Tsang, Irving C., to Stone & Webster Engineering Corporation. Apparatus for production of synthesis gas using convective reforming. 5,006,131, Cl. 422-201.000.

Karasawa, Kazunori. *See*—
Koichi, Yasushi; Sohmiya, Norimasa; and Karasawa, Kazunori, 5,006,896, Cl. 355-246.000

Karbach, Stefan. *See*—
Seele, Rainer; Kober, Reiner; Karbach, Stefan; Sauter, Hubert; Ammermann, Eberhard, Lorenz, Gisela, Rademacher, Wilhelm, and Jung, Johann, 5,006,152, Cl. 71-92.000.

Karino, Hiroyuki. *See*—
Ohba, Nobuyuki; Ikeda, Atsuhiko; Matsunari, Kenji; Yamada, Yuji, Hirata, Michiya; Nakamura, Yasuo, Takeuchi, Akira; and Karino, Hiroyuki, 5,006,157, Cl. 71-95.000.

Karl Storz Endoscopy-America, Inc. *See*—
Jones, Eric M., 5,006,965, Cl. 362-32.000.

Karl Thomae GmbH. *See*—
Engel, Wolfhard; Eberlein, Wolfgang; Mihm, Gerhard, Trummlitz, Gunther; Mayer, Norbert; and De Jonge, Adriaan, 5,006,522, Cl. 514-221.000.

Karle, Anton. *See*—
Rembold, Helmut; Pflug, Hannes; Christ, Wilhelm; Siebert, Hans-Joachim; Eblen, Ewald; Rodriguez-Amaya; Laufer, Helmut, Schmitt, Alfred; Pape, Werner; Buisson, Dominique, Lauvin, Pierre; Potz, Detlev, Simon, Nikolaus; Pigeroulet, Jean, and Karle, Anton, 5,005,548, Cl. 123-450.000.

Karlsson, Harry L., to Sandvik AB. Roller bit. 5,005,989, Cl. 384-94.000.

Karr, Steven G. *See*—
O'Donnell, Matthew, Welles, Kenneth B., II; Crawford, Carl R., Pelc, Norbert J.; and Karr, Steven G., 5,005,419, Cl. 73-626.000

Karron, Abraham. *See*—
Squillante, Peter L.; Egyud, Julius; and Karron, Abraham, 5,007,019, Cl. 364-900.000.

Karsunky, Ulrich. *See*—
Martini, Thomas; Keil, Karl-Heinz; Karsunky, Ulrich; and Sternberger, Klaus, 5,006,129, Cl. 8-554.000

Kasahara, Seitaro; Itakura, Haruo; and Kurihara, Susumu, to Konica Corporation. Image forming apparatus capable of performing serial page copy. 5,006,891, Cl. 355-208.000.

Kasei Optonix, Ltd.. *See*—
Yoneshima, Kunihiko; and Takahashi, Fumio, 5,006,277, Cl. 252-301.60S.

Kashiwadate, Ken: *See*—
Fukuda, Makoto, Kashiwadate, Ken; Kouyama, Toshitaka, and Shiiki, Zenya, 5,006,591, Cl 524-502.000

Kasparian, Kaspar A., Rogers, Aaron S., Hsu, Ming-Chyuan, and Fussell, John P., to Teletec Corporation. Bidirectional digital serial interface for communication digital signals including digitized audio between microprocessor-based control and transceiver units of two-way radio communications equipment. 5,007,050, Cl. 370-77.000.

Kasper, Bryon L. *See*—
Kahn, Joseph M., and Kasper, Bryon L., 5,007,106, Cl 455-619.000

Kasuga, asao; Mori, Takayuki; and Tsukada, Nobuo, to Seiko Instruments Inc. Travelling-wave motor. 5,006,746, Cl. 310-323.000.

Kasuya, Akira, and Suzuki, Toshio, to Toray Silicone Company, Limited. Self-bonding curable organopolysiloxane composition. 5,006,580, Cl. 524-264.000.

Katagiri, Shigenobu *See*—
Mochizuki, Takeshi; Katagiri, Shigenobu; Seino, Minoru, Ohshima, Minoru, Saito, Susumu, and Arimoto, Akira, 5,006,704, Cl 250-235.000.

Kataoka, Jyun *See*—
Tono, Show, Miki, Toshiyuki; Dairokuno, Yoshihide; and Kataoka, Jyun, 5,006,639, Cl. 210-727.000

Kataoka, Keiji, to Hitachi, Ltd. Optical projection apparatus with the function of controlling laser coherency. 5,005,969, Cl. 353-122.000.

Kataoka, Naoki *See*—
Shikatani, Yutaka; Kataoka, Naoki, Shimo, Yoshiyuki, Kuroda, Nobuyuki; and Matsuura, Kazuo, 5,006,633, Cl. 528-230.000.

Katayama, Yoshio *See*—
Fujioka, Hideaki; and Katayama, Yoshio, 5,005,916, Cl 303-103.000.

Katircioglu, Haluk; De Beule, John A.; and Mukherjee, Debaditya, to Unisys Corporation. Self-testing circuitry for VLSI units. 5,006,787, Cl. 324-73.100.

Kato, Eiichi, to Fuji Photo Film Co., Ltd. Liquid developer for electrostatic photography. 5,006,441, Cl. 430-114.000.

Kato, Keiichi *See*—
Kumagai, Motoo; Kato, Keiichi, Takeuti, Humio; Nagano, Masato; and Sakaguchi, Michiaki, 5,006,957, Cl 361-321.000

Kato, Keiko; Kageyama, Shigeki; Amano, Yoshikazu, Arai, Fuminori, and Katsuyama, Harumi, to Fuji Photo Film Co., Ltd. Analytical element having a polyacrylamide or derivative to minimize background for assaying enzyme activity. 5,006,458, Cl 435-4.000.

Kato, Kenji, Koike, Mikio, Orii, Akira, and Fuchigami, Shinichi, to Janome Sewing Machine Co., Ltd. Automatic embroidering machine with pattern input means. 5,005,500, Cl 112-121.120.

Kato, Shigeru *See*—
Takanashi, Itsuo; Tanaka, Hedeshi, Kato, Shigeru; Osada, Naomi, and Ichito, Toshikatsu, 5,005,998, Cl. 400-208.000.

Kato, Tsuyoshi: *See*—
Kobayashi, Yasutomo; and Kato, Tsuyoshi, 5,005,885, Cl 292-336.300.

Kato, Yoshiko, Yoshinaga, Junji; Shogaki, Takeshi; Kurano, Satoko, and Yano, Ikuya, to Sawai Pharmaceutical Co., Ltd. α,α-trehalose trimycolates and pharmaceutical compositions. 5,006,514, Cl 514-53.000.

Kato, Yoshiko: *See*—
Satoh, Toshio, Matsumoto, Hitoshi, Kakegawa, Hisao, Kato, Yoshiko; Riku, Juichi, Yoshinaga, Junji, and Kanamoto, Yoshifumi, 5,006,548, Cl. 514-427.000

Kato, Yoshitake *See*—
Fukunaga, Kazuya; Kato, Yoshitake, and Yoshimura, Hiroyuki, 5,006,948, Cl. 360-133.000.

Kato, Yoshito: *See*—
Kuno, Toshitaka; Koide, Mitsuo; Nakano, Masaru; Hayashi, Chisao; Kato, Yoshito; and Ishiguro, Yasuo, 5,006,999, Cl 364-513.000.

Katoh, Kazunobu *See*—
Yagihara, Morio; Okada, Hisashi, and Katoh, Kazunobu, 5,006,445, Cl. 430-264.000

Katoh, Takehiro, Azuma, Yoshihiko; Hirano, Masayasu; Kageyama, Naohiro, Ishimura, Toshihiko, Tsuji, Kenji, and Ootsuka, Hiroshi, to Minolta Camera Kabushiki Kaisha. Camera system. 5,006,877, Cl. 354-412.000

Katsu, Kanemasa *See*—
Kamiya, Takashi, Naito, Toshihiko; Negi, Shigeto, Komatu, Yuuki, Kai, Yasunobu; Nakamura, Takaharu, Sugiyama, Isao, Machida, Yoshimasa; Nomoto, Senchiro, Kitoh, Kyosuke, Katsu, Kanemasa; and Yamauchi, Hiroshi, 5,006,649, Cl 540-222.000

Katsumata, Shin, and Corcoran, Mark W., to Sundstrand Corporation. Floating annular seal with thermal compensation. 5,006,043, Cl 415-113.000

Katsuyama, Harumi *See*—
Kato, Keiko, Kageyama, Shigeki; Amano, Yoshikazu; Arai, Fuminori, and Katsuyama, Harumi, 5,006,458, Cl. 435-4.000.

Katsuyama Kinzoku Kogyo Kabushiki Kaisha *See*—
Sugimoto, Mutsumi, 5,005,267, Cl. 24-637.000

Kaufold, Roger W. *See*—
Dorfman, Mitchell R., Kaufold, Roger W.; Kushner, Burton, Rotolico, Anthony J.; and Tilkaran, Roopnarine, 5,006,321, Cl 427-192.000

Kaukeinen, Joseph Y., to Eastman Kodak Company. Method of making a fiber optic array. 5,006,201, Cl. 156-633.000.

Kavesh, Sheldon, Kim, Kwang; Kwon, Young D., and Prevorsek, Dusan C., to Allied-Signal. Rigid polyethylene reinforced composites having improved short beam shear strength. 5,006,390, Cl 428-105.000.

Kawabe, Masaki *See*—
Watanabe, Tsutomu; Sagiyama, Masaru, Kawabe, Masaki; and Morita, Masaya, 5,006,420, Cl. 428-629.000

Kawabe, Masanao, Kimura, Masao, Sugiyama, Kazuhiro; Yamaoka, Ikuro; and Inoue, Hiroharu, to Nippon Steel Corporation, and Nippon Steel Chemical Co., Ltd. Aromatic polyester carbonate from diphenol mixture. 5,006,631, Cl. 528-204.000.

Kawabe, Nozomu *See*—
Yamamoto, Susumu; Murai, Teruyuki; Kawabe, Nozomu, and Tobioka, Masaaki, 5,006,289, Cl. 264-61.000

Kawada, Kazuo *See*—
Noguchi, Hiroshi, and Kawada, Kazuo, 5,006,668, Cl 174-75.00C

Kawada, Susumu *See*—
Uemura, Satoshi, Kawada, Susumu; Sekine, Yoshitada; and Miyauchi, Tatsuo, 5,005,277, Cl. 29-407.000

Kawagishi, Hideyuki, to Canon Kabushiki Kaisha. High contrast liquid crystal element. 5,005,953, Cl. 350-341.000.

Kawaguchi, Chikakazu *See*—
Sakamoto, Seiji, Kawaguchi, Chikakazu, Meguro, Yoshio, Harada, Takashi; and Takisawa, Toshifumi, 5,006,589, Cl. 524-430.000

Kawaguchi, Toshikazu *See*—
Hashimoto, Kaoru, Kawaguchi, Toshikazu; and Hasegawa, Hirofumi, 5,006,934, Cl. 358-296.000

Kawai, Michio, Tanaka, Sadahiro; and Osanai, Osamu, to Kao Corporation. Surface profile analyzer. 5,005,975, Cl. 356-237.000

Kawai, Yoshio *See*—
Inokuchi, Kiyoshi, Okadome, Kenichiro; Muto, Yoichi, Kawai, Yoshio, Onuma, Tadashi; and Shirakami, Toshiharu, 5,006,111, Cl. 604-67.000

Kawajiri, Kazuhiro, Muda, Takashi; and Inoue, Kiyoshi, to Fuji Photo Film Co., Ltd. Image processing method in an electronic video endoscopy system. 5,006,928, Cl. 358-98.000

Kawakami, Hiroshi *See*—
Itoh, Kazuo; Naoi, Yoshitake; Matsushita, Hajime, Ebata, Takashi, and Kawakami, Hiroshi, 5,006,646, Cl 536-23.000.

Kawakami, Motozo *See*—
Nakamura, Katsunari; Ueda, Kenichiro, Irie, Yoshirou; Hoshi, Toyokazu, and Kawakami, Motozo, 5,006,996, Cl. 364-478.000

Kawakami, Soichiro. *See*—
Kanai, Masahiro, Aoike, Tatsuyuki; Matsuda, Koichi; and Kawakami, Soichiro, 5,006,180, Cl. 136-258.000.

Kawakita, Kouji, Kimura, Suzushi, Orinaka, Hideyuki; Yokotani, Youichiro, and Ishikawa, Mariko, to Matsushita Electric Industrial Co., Ltd. Dielectric ceramic composition. 5,006,956, Cl. 361-321.000.

Kawamoto, Atsushi *See*—
Kuzuo, Ryuichi, Kawamoto, Atsushi; Tada, Junya, Ohmori, Kenji, and Sekiya, Hiroko, 5,006,388, Cl. 428-64.000.

Kawamura, Hideo, to Isuzu Ceramics Research Institute Co., Ltd Engine cycle control system. 5,005,539, Cl. 123-21.000

Kawamura, Hideo, to Isuzu Motors Limited. Exhaust gas recirculation system of engine. 5,005,552, Cl. 123-571.000.

Kawano, Mutsumi *See*—
Takeda, Hisao; and Kawano, Mutsumi, 5,006,590, Cl. 524-458.000

Kawasaki Industries, Ltd *See*—
Okamoto, Osamu Nakaya, Teruomi; Suzuki, Seizo; Kuwano, Naoaki; Sakai, Yoshinori; Oda, Hiroshi; Uegusa, Masao, and Iba, Goji, 5,005,786, Cl. 244-161.000.

Kawasaki Jukogyo Kabushiki Kaisha *See*—
Yoshida, Ryuichi, Sawada, Takashi, Yamamural Tetsushi, and Kadota, Koji, 5,005,660, Cl 180-117.000

Kawasaki, Keiji, Sekiguchi, Michio; and Matsuhisa, Tadaaki, to NGK Insulators, Ltd. Detecting flaws formed in surfaces of rotating members with ultrasonic waves. 5,005,417, Cl. 73-593.000

Kawasaki Steel Corporation. *See*—
Fujita, Tsutomu, Imura, Hidetoshi; and Akahide, Kohzo, 5,006,687, Cl. 219-121.590.
Kiyota, Yoshisato, 5,006,164, Cl 75-255.000.

Kawase, Hideyuki, Sahashi, Noboru; and Hashizume, Tamotsu, to NGB Spark Plug Co., Ltd. Method of producing a joined article through bonding with low melting point glass. 5,006,143, Cl 65-43.000

Kawashima, Masaki; and Miyagaki, Kouichi, to Kawashima, Masaki Strapped fastener assemblage. 5,005,699, Cl. 206-344.000.

Kayanuma, Kanji *See*—
Shikunami, Juichi, Itonaga, Makoto; Kayanuma, Kanji; Kai, Masakatsu; and Nakamura, Nobuaki, 5,006,703, Cl. 250-231.130

Kazaoka, Kenichi, and Okazaki, Hiroshi, to Aisin Seiki Kabushiki Kaisha. Orbital rotor compressor having an inlet passage in the rotor. 5,006,052, Cl 418-61.100.

Kazerounian, Reza, Ali, Syed; and Eitan, Boaz, to WaferScale Integration Inc. On-chip high voltage generator and regulator in an integrated circuit. 5,006,974, Cl 363-60.000

Kazuhito, Ishida; Eiji, Shibata; and Kazumasa, Makino, to Brother Kogyo Kabushiki Kaisha. Imaging device. 5,006,884, Cl. 355-27.000

Kazumasa, Makino *See*—
Kazuhito, Ishida, Eiji, Shibata; and Kazumasa, Makino, 5,006,884, Cl. 355-27.000.

Kazunari, Komatsu *See*—
Yutaka, Yoshida, Kazuo, Onaga, Mariko, Hanada; and Kazunari, Komatsu, 5,006,828, Cl. 338-34.000.

Kazuo, Onaga: *See*—
Yutaka, Yoshida; Kazuo, Onaga; Mariko, Hanada; and Kazunari, Komatsu, 5,006,828, Cl. 338-34.000.

Kazushige, Nishida *See*—
Arima, Yoshihiro, Otuka, Soiti; and Kazushige, Nishida, 5,006,376, Cl 428-34.100.

Kedem, Dan; and Rubinstein, Mordechai, to Du-Kedem Technologies, Ltd., and Du-Kedem Projects Ltd. Fruit picking device. 5,005,347, Cl 56-328.100

Keil, Karl-Heinz *See*—
Martini, Thomas, Keil, Karl-Heinz, Karsunky, Ulrich, and Sternberger, Klaus, 5,006,129, Cl. 8-554.000

Keiper, Francis P., III: *See*—
Schmuckal, Peter J., Phillips, Mitchell S., Keiper, Francis P., III, Sprout, James C., and Fried, Ronald H., 5,007,081, Cl 379-354.000

Kelders, Jan *See*—
Raar, Hans; and Kelders, Jan, 5,005,999, Cl 400-208.000

Kelleher, Barbara J., Walsh, Michael J., and Cone, Richard E., to Hartley Associates Inc. Infant car bed for a vehicle. 5,005,234, Cl 5-94.000.

Keller, Alfred E *See*—
Veatch, Fred C., and Keller, Alfred E., 5,006,258, Cl. 210-677.000

Keller, Hans J., to Eltec Instruments, Inc. Catoptric differential sensing device. 5,006,712, Cl. 250-353.000

Keller, Rene: *See*—
Mandrin, Charles, and Keller, Rene, 5,006,133, Cl. 55-53.000

Keller, Ursula, and Knox, Wayne H., to AT&T Bell Laboratories. Nonlinear external cavity modelocked laser. 5,007,059, Cl. 372-18.000

Keller, Wilhelm A. Dispensing apparatus for operating double cartridges. 5,005,735, Cl. 222-137.000

Kellogg Company *See*—
Webster, Jeffrey, Richey, Stephen and Tuttup, Robert, 5,005,410, Cl. 73-335.000

Kelly, James H., Jr. to Pulaski Furniture Corporation. Case clock with illuminated pendulum. 5,007,036, Cl. 368-134.000

Kelly, John J. *See*—
Guggenheim, Thomas L., Fukuyama, James M., and Kelly, John J., 5,006,637, Cl 528-355.000

Kelly, Michael G *See*—
Fyler, Donald C., Van Duyne, Edward A., and Kelly, Michael G., 5,005,823, Cl. 271-228.000

Kelly Services, Inc.: *See*—
Cummins, Marty T., 5,007,682, Cl 380-4.000

Kelman, Josh, to Davidson Textron Inc. Energy absorbing bumper fastener system. 5,005,887, Cl 293-120.000

Kemkers, Pieter, Van Roosmalen, Johannes H. M., and Venema, Bernardus G. J. L., to U.S. Philips Corporation. Method of positioning products on a tape comprising compartments as well as an apparatus for implementing the method. 5,005,338, Cl 53-494.000

Kemner, Rudolf: *See*—
Boskamp, Eddy B., and Kemner, Rudolf, 5,006,803, Cl. 324-311.000

Kempf, Stephan: *See*—
Sichmann, Eggo, Krug, Thomas, and Kempf, Stephan, 5,006,213, Cl. 204-192.140

Kemske, Jonathon D. *See*—
Wendt, Dan J.; Kemske, Jonathon D., and Pesheck, Peter S., 5,006,684, Cl. 219-10.55E

Kenall Manufacturing Company *See*—
Mackiewicz, Edward T., 5,006,970, Cl. 362-217.000

Kendall Company, The *See*—
Gilman, Thomas H., and Westlake, Betsy C., 5,005,567, Cl 128-165.000

Kennametal Inc. *See*—
Beach, Wayner H., Den Besten, Leroy E., and Rowlett, Don C., 5,005,622, Cl 144-241.000

Kennedy, Melvin R., and Lubinski, Joseph J., to Lewis Galoob Toys, Inc. Ultra-miniature vehicle. 5,006,090, Cl. 446-462.000.

Kennedy, William J.; Leach, Peter E., and Grogan, Larry N., to Velcro Industries B.V. Foamed seat cushion. 5,005,242, Cl. 5-481.000

Kent-Moore Corporation: *See*—
Manz, Kenneth W., 5,005,369, Cl 62-195.000.
Manz, Kenneth W., and Parks, Richard, 5,005,375, Cl 62-292.000

Kentek Information Systems, Inc. *See*—
Kinoshita, Koichi, 5,006,868, Cl. 346-157.000

Kerbaugh, Michael L., Koburger, Charles W., III; and Macheeney, Brian J., to International Business Machines Corporation. Forming wide dielectric-filled planarized isolation trenches in semiconductors. 5,006,482, Cl 437-67.000

Kernevez, Nelly *See*—
Berchadsky, Yves, Kernevez, Nelly, Le Moigne, Francois, Mercier, Anne, Secourgeon, Liliane, and Tordo, Paul, 5,006,663, Cl 548-412.000

Kerska, Donald H *See*—
Bugin, Marion, Jr., Dawson, Gary D.; Franks, Kerry D., Geiss, Richard O., and Kerska, Donald H., 5,005,550, Cl 123-520.000

Kerth, Juergen: *See*—
Zolk, Ralf; Kerth, Juergen, and Hemmerich, Rainer, 5,006,620, Cl. 526-128.000

Kestner, Diane E. *See*—
Anderson, Charles C., Kestner, Diane E., Lewis, Mark A., and Opitz, Gary R., 5,006,451, Cl 430-527.000

Kettler, David C *See*—
Brandt, Christopher D., Kettler, David C., Windish, Willis E. and Blake, William W., 5,006,100, Cl. 475-138.000

Key-Tech, Inc.: *See*—
Durand, David, 5,006,397, Cl. 428-209.000

Keystone International Holdings Corp.: *See*—
Kueffer, Max; and Feiss, Roy L., 5,005,605, Cl 137-625.390

Khalil, Omar S.; Hanna, Charles F., Zurek, Thomas F., and Grigalauski, Denise A., to Abbott Laboratories. Immunoassay device with liquid transfer between wells by washing. 5,006,309, Cl. 422-56.000.

Khoshnevisan, Mohsen, and Yeh, Pochi A., to Rockwell International Corporation. Nonlinear optical doppler imaging amplifier. 5,006,813, Cl 330-4.300

Kibler, Jack M.; Schmotzer, Jack K., and Stauffer, Charles C., to Electric Power Research Institute, Inc. Automated membrane filter sampler. 5,005,430, Cl 73-863.010

Kikkawa, Atsushi *See*—
Nagata, Shinichi, Kikkawa, Atsushi, and Endo, Kenji, 5,005,959, Cl 350-452.000

Kikuchi, Akira *See*—
Yoshizawa, Masahiro, Kikuchi, Akira, Wada, Kou; Fujinami, Minpei, and Shimazu, Nobuo, 5,006,795, Cl. 324-158.00R

Killguss, Heinrich *See*—
Mirlieb, Bernd; and Killguss, Heinrich, 5,007,075, Cl. 378-172.000.

Kim, Bang M. *See*—
Woodmansee, Donald E., and Kim, Bang M., 5,006,373, Cl 427-422.000.

Kim, Byeongyun, and Hwang, Sangki, to Samsung Electronics Co., Ltd. Bitline precharge circuit of multi-sectional memory array. 5,007,023, Cl. 365-203.000

Kim, Dong Seok *See*—
Lee, Chong Jin, and Kim, Dong Seok, 5,006,068, Cl 433-169.000

Kim, Kwang *See*—
Kavesh, Sheldon; Kim, Kwang, Kwon, Young D., and Prevorsek, Dusan C., 5,006,390, Cl. 428-105.000

Kim, Kwang-Shick Artificial stone wick for a burner and processes for the preparation thereof. 5,006,498, Cl. 502-68.000

Kim, Soo K., to Goldstar Co., Ltd. Impedance roller structure for VCR. 5,005,748, Cl 226-190.000

Kimberly-Clark Corporation *See*—
Alikhan, Mir I., Colrud, Sandra M., and Sneyd, James C., 5,006,116, Cl 604-365.000

Kimpara, Mamoru *See*—
Adachi, Takeshi, Mizuno, Kotaro; Yamada, Shigeru, Suzuki, Hideo, and Kimpara, Mamoru, 5,005,459, Cl 84-453.000

Kimura, Hiromichi, Iwatsuki, Kunihiro; Taniguchi, Hiroji; Taniguchi, Takuji, and Ishikawa, Kazunori, to Toyota Jidosha Kabushiki Kaisha; and Aisin AW Co., Ltd. Hydraulic control apparatus for automatic transmission for motor vehicle. 5,005,444, Cl. 74-868.000

Kimura, Masao: *See*—
Kawabe, Masanao; Kimura, Masao, Sugiyama, Kazuhiro, Yamaoka, Ikuro; and Inoue, Hiroharu, 5,006,631, Cl 528-204.000.

Kimura, Naofumi *See*—
Hamada, Hiroshi, Takamatsu, Toshiaki, and Kimura, Naofumi, 5,006,840, Cl 340-784.000

Kimura, Nariko *See*—
Yoshizawa, Tomomi, and Kimura, Nariko, 5,006,437, Cl 430-359.000

Kimura, Suzushi *See*—
Kawakita, Kouji, Kimura, Suzushi; Orinaka, Hideyuki; Yokotani, Youichiro; and Ishikawa, Mariko, 5,006,956, Cl 361-321.000.

Kimura, Yuichiro, Kabuto, Nobuaki, Takashimizu, Satoru, and Masujima, Katsuhiro, to Hitachi, Ltd. Capacitive load drive circuit. 5,006,739, Cl 307-270.000.

Kinetic Software, Inc.: *See*—
Ehret, Charles F.; and Ashton, William T., Jr., 5,006,985, Cl. 364-413.010

Kinetics Concepts, Inc. *See*—
Vrzalik, John H., 5,005,240, Cl 5-453.000

King, Donald D., to Thermo King Corporation. Air conditioner unit for mounting on or in the roof of a vehicle. 5,005,372, Cl. 62-244.000

King, Ernest L., and Durham, Lee R. Fishing caddy apparatus. 5,005,847, Cl. 280-47.190

King, James L.; and Lykes, Robert E., to A. O. Smith Corporation. Multiple compartmented dynamoelectric machine. 5,006,743, Cl 310-89.000

Kinoshita, Koichi, to Kentek Information Systems, Inc. Method and apparatus for printing two or more colors using an electrophotographic process. 5,006,868, Cl. 346-157.000

Kinsinger, Malcolm H., to Caterpillar Inc. Track adjusting mechanism. 5,005,920, Cl 305-10.000

Kinstler, William G. Illuminated vehicle sign. 5,005,306, Cl 40-591.000

Kinuhata, Satoru; Takami, Masao, Shibata, Eiji, and Tamura, Tadahiko, to Sumitomo Rubber Industries Inc. Method for correcting tire deflection in tire grooving and apparatus therefor. 5,005,628, Cl. 157-13.000

Kirby, Roy *See*—
Goodwin, John C.; Kirby, Roy, and Langley, Ernest A., 5,005,725, Cl. 220-261.000

Kiriaki, Sami, and Tan, Khen-Sang, to Texas Instruments Incorporated. Hysteresis insensitive analog to digital converter system using a coarse comparator and a fine comparator. 5,006,853, Cl. 341-156.000.

Kiriyama, Tsutomu *See*—
Santa, Toshihiro; and Kiriyama, Tsutomu, 5,006,629, Cl 528-183.000

Kishi, Hiroshi; Chazono, Hirokazu, Oshio, Minoru; Saito, Hiroshi, Nakamura, Toshiya, and Shizuno, Hisamitsu, to Taiyo Yuden Co., Ltd. Solid dielectric capacitor and method of manufacture. 5,006,954, Cl 361-321.000

Kishi, Hiroshi, Chazono, Hirokazu, Oshio, Minoru, Saito, Hiroshi, Nakamura, Toshiya, and Shizuno, Hisamitsu, to Taiyo Yuden Co.,

Ltd. Solid dielectric capacitor and method of manufacture 5,006,955, Cl 361-321.000.
Kishimoto, Toshiki, and Imamura, Kuniyasu, to Sumitomo Metal Mining Company Limited. Process for preparing single crystal of potassium titanium arsenate. 5,006,199, Cl. 156-621.000.
Kisida, Hirosi *See*—
Tsushima, Kazunori; Matsuo, Noritada; Kisida, Hirosi, and Yano, Toshihiko, 5,006,538, Cl 514-345.000.
Kiss, Laszlo, Justus, Gyula, Zsuppan, Jozsef, and Knollmar, Tibor, to Szekszardi Allami Gazdasag KSZE Novenytermelesi Rendszer. Method and composition for the treatment of field plant seeds 5,006,149, Cl. 71-81.000
Kistner, Kenneth J., to Specified Equipment Systems Company, Inc Method and apparatus for applying multicomponent materials 5,005,765, Cl. 239-135.000.
Kistner, Kenneth J Material processor. 5,005,982, Cl. 366-272.000
Kita, Fujio, to Mitsubishi Denki K.K. X-Y table device in automatic sewing machine 5,005,501, Cl. 112-121.120.
Kitagawa, Mitsuhiko *See*—

Mannesmann Aktiengelselischaft *See*—
Nerger, Klaus K., Klein, Hans J , and Burkart, Gunther, 5,005,889, Cl. 294-86.400

Manusch, Cristoph, and Harp, Hans-Jurgen, to Pelikan Aktiengesellschaft. Hand operated device for transferring a film from a carrier tape to a substrate. 5,006,184, Cl. 156-577.000

Manz, Kenneth W , to Kent-Moore Corporation Refrigerant purification with automatic air purge. 5,005,369, Cl 62-195.000

Manz, Kenneth W , and Parks, Richard, to Kent-Moore Corporation Refrigeration equipment service apparatus with quick-disconnect couplings. 5,005,375, Cl 62-292.000.

Mar, Andrew: *See*—
Behrens, Rudolf A ; and Mar, Andrew, 5,006,577, Cl 524-95.000

Mara, Robert M. *See*—
Roehrs, Daniel C ; Caruso, Angelo T , Grace, Robert E , Mara, Robert M , Elliot, John G , Saraceno, Patricia J , and Pacer, James M , 5,006,892, Cl 355-208.000.

Marbert GmbH. *See*—
Mottschke, Lothar, and Tronnier, Hagen, 5,006,337, Cl 424-195.100.

Marchael, Dennis L.: *See*—
Popelier, Maurice A ; McCunn, Myron L , Winter, David C , Marchael, Dennis L , Hall, James W , and Rohren, Ronald E , 5,005,597, Cl 134-25.100.

Marchessault, Robert H. *See*—
Schwarz, William M.; Marchessault, Robert H , Alexandru, Lupu, and Henrissat, Bernard, 5,006,170, Cl. 106-20.000

Marcus, R. Kenneth, to Clemson University Analytical method and apparatus. 5,006,706, Cl. 250-288.000

Margarit, Josette *See*—
Franceschini, Jacqueline; and Margarit, Josette, 5,006,570, Cl. 514-422.000

Marhold, Albrecht *See*—
Fischer, Reiner; Jensen-Korte, Uta, Kunisch, Franz, Marhold, Albrecht, Ooms, Pieter, Schallner, Otto, Santel, Hans-Joachim, Schmidt, Robert R., Krauskopf, Birgit, and Strang, Harry, 5,006,148, Cl 71-72.000.

Mariko, Hanada *See*—
Yutaka, Yoshida; Kazuo, Onaga, Mariko, Hanada, and Kazunari, Komatsu, 5,006,828, Cl. 338-34.000.

Markfelt, Reinhold S *See*—
Anderson, Thomas A.; Kalar, Richard G , Markfelt, Reinhold S.; and Wagner, Walter R., 5,006,228, Cl. 209-365.300

Markle, Stephen; Hutchings, William; Schutte, Marlin, and Howk, Richard, to General Signal Corporation Chuck mechanism for detachably connecting impeller shaft and drive unit of mixing apparatus. 5,005,843, Cl 279-29.000

Markley, Lowell D.; Hamilton, Christopher T.; Swisher, Beth A , and Secor, Jacob, to DowElanco Substituted cyclohexanediones and their herbicidal uses. 5,006,159, Cl 71-98.000

Markow, Paul A , Hammond, Kevin R., and Hutchings, Donald E , to Chrysler Corporation. Distance pulse averaging unit 5,007,035, Cl 368-118.000.

Markowski, Winfried, to Bundesanstalt fur Materialforschung und -prufung (BAM) Machine and method for uniaxial mechanical material testing. 5,005,424, Cl 73-834.000

Marks, Larry D., Stiles, Richard C., and Bartloff, William F , to Whirlpool Corporation. Mechanically actuated additive dispenser for dishwasher 5,005,740, Cl. 222-651.000

Marlowe, Christian P.: *See*—
Marlowe, Edward D.; and Marlowe, Christian P , 5,006,833, Cl 340-611.000

Marlowe, Edward D , and Marlowe, Christian P , to CDF, Inc Sewer line restriction alarm placed in clean out plug. 5,006,833, Cl 340-611.000.

Marmarosi, Katalin *See*—
Sarkozy, Peter, Pap, Laszlo ; Szego, Andras, Nagy, Lajos, Szekely, Istvan, Marmarosi, Katalin, and Grosch, Janos, 5,006,545, Cl 514-395.000

Marmon Corporation *See*—
Foster, Matthew R., 5,005,523, Cl 119-37.000

Maroulis, Peter J , Clark, Patrick J ; Morris, Victoria J , Byerley, Robert A , and Booker, John, to Air Products and Chemicals, Inc Automated preparative gas chromatograph. 5,006,315, Cl 422-89.000

Marple, Virgil A *See*—
Behm, Steven M , Marple, Virgil A., and Burton, Robert M , 5,006,227, Cl. 209-143.000.

Marrocco, Anthony R.. *See*—
Pare, Rodney H., Tata, Peter D , and Marrocco, Anthony R., 5,005,255, Cl. 16-115.000

Marsch, Wilhelm *See*—
Wolfer, Dietrich; and Marsch, Wilhelm, 5,006,372, Cl. 427-387.000.

Marsh, Gary L.. *See*—
Calcar, Henry V., and Marsh, Gary L., 5,006,845, Cl 340-853.000.

Marshall, Ernest H. Shift mechanism. 5,005,438, Cl 74-538.000

Marshall, Rodney G Electric lamp and adapter socket therefor. 5,006,751, Cl. 313-51.000.

Marshfield Clinic *See*—
Mazza, Joseph J , 5,005,585, Cl. 128-754.000

Martel, Olivier *See*—
Demazeau, Gerard, Martel, Olivier, Devalette, Michel, and Verdon, Eric, 5,006,318, Cl. 423-21.100

Marth, Egon *See*—
Stemmler, Kurt, Weckop, Ludwig, and Marth, Egon, 5,005,816, Cl 270-39.000

Martin, Carl J *See*—
Parks, David L., Jr , and Martin, Carl J , 5,006,325, Cl 423-390.000.

Martin, Charles R., Rousser, Robert; and Brabec, Daniel L , to United States of America, Agriculture Rapid, single kernel grain characterization system 5,005,774, Cl 241-101.200

Martin, Donn D *See*—
Meier, Albert H , Cincotta, Anthony H , and Martin, Donn D , 5,006,526, Cl 514-250.000.

Martin, Gary *See*—
Clemens, Clive; and Martin, Gary, 5,005,904, Cl. 297-284.000.

Martin Marietta Energy Systems, Inc. *See*—
Liu, Chain T , and Sikka, Vinod K , 5,006,308, Cl. 420-445.000

Martin, Russell E. Disposable taco holder. 5,005,704, Cl 206-564.000.

Martin, Samuel W , and Supron, Steven A. Apparatus for folding and sealing a form along a transverse edge 5,006,195, Cl 16-442.100.

Martin, William C. *See*—
Matyas, Stephen M , Johnson, Donald B.; Le, An V , Martin, William C , Prymak, Rostislaw, and Wilkins, John D , 5,007,089, Cl 380-49.000

Martin, William R *See*—
Dolkas, Gregory D ; and Martin, William R., 5,007,051, Cl 370-85.100

Martini, Thomas, Keil, Karl-Heinz, Karsunky, Ulrich, and Sternberger, Klaus, to Hoechst Aktiengesellschaft Dyeing textile material with pigment dyes, pre-treatment with quaternary ally ammonium salt polymer 5,006,129, Cl 8-554.000.

Maruma Jyusharyo Kabushiki Kaisha *See*—
Moriki, Yasumitsu, and Numakura, Hirotomo, 5,005,654, Cl. 173-12.000

Marumo, Teruumi *See*—
Akasaki Yutaka, Aonuma, Hidekazu; Hongo, Kazuya, Sato, Katsuhiro, Nukada, Katsumi; and Marumo, Teruumi, 5,006,435, Cl 430-58.000

Maruyama, Fumio, Suyama, Tomio; Kamino, Hiroaki; Suyama, Koji; Kuwahara, Tokihiro, and Nagata, Osamu, to Hoshizaki Denki Kabushiki Kaisha. Electric control apparatus for dishwashing machine 5,006,767, Cl 318-103.000

Maruyama, Haruhisa. Ishiguro, Ken-ichi, Watanabe, Hiroaki; and Yagisawa, Osamu, to Pioneer Electronic Corporation Apparatus for injection molding information recording disks. 5,006,058, Cl 425-556.000

Maruyama, Hiromi *See*—
Suzuki, Norio, Oda, Sennosuke; Maruyama, Hiromi and Hoshino, Kenichi, 5,006,426, Cl 429-94.000

Maruyama, Kazuyoshi *See*—
Miyoshi, Seiji, Fukuda, Misao; Yamato, Seiichi, Tokiwa, Kouji, and Maruyama, Kazuyoshi, 5,007,044, Cl 370-32.100

Marvalaud, Incorporated *See*—
Pond, Robert B , Sr., 5,006,414, Cl. 428-469.000

Marzupio, Maurizio *See*—
Borrione, Pierluigi A , Caizzi, Vittorio, Marzupio, Maurizio, and Morris, Jean E., 5,006,215, Cl. 204-253.000

Maseki, Shinobu *See*—
Takase, Isao, Takemoto, Haruki; Tatsuta, Mitsugu, Maseki, Shinobu; Kano, Takenori, Yokoyama, Fumitomo, and Niimi, Mamoru, 5,006,102, Cl 475-282.000

Massachusetts Eye and Ear Infirmary *See*—
Congdon, Richard G , 5,005,230, Cl 5-60.000

Massachusetts Institute of Technology *See*—
Blanco, Ernesto E., Chesnais, Pascal R., Kristal, Phyllis K , and Lippman, Andrew B., 5,005,559, Cl 128-4.000

Massmann, Hans-Joachim Portal system 5,006,036, Cl 414-744.500

Masson, Ronald K , and Edelson, Michael W , to American Communications & Engineering, Inc Automated order entry recording method and apparatus 5,007,078, Cl. 379-75.000

Masters, David R *See*—
Holcombe, Cressie E , Northcutt, Walter G , Jr , Masters, David R., and Chapman, Lloyd R., 5,006,306, Cl 420-3.000.

Masuda, Hisami *See*—
Ohta, Katsuhiro, Masuda, Hisami, and Makishima, Mamoru, 5,006,844, Cl 340-448.000.

Masuda, Katsuhiko *See*—
Takano, Masami, Hamada, Tetsurou, and Masuda, Katsuhiko, 5,005,685, Cl. 192-58.00B.

Masuda, Sadakazu; Fujita, Fumio; Murakami, Tadayoshi Yoshino, Masahiko, Yagi, Ryuichi, and Kamata, Masamoto, to Nippon Kokan Kabushiki Kaisha Lubricating method for warm rolling of high silicon steels 5,006,181, Cl. 148-111.000.

Masuda, Tsuyoshi; Tomihari, Hiromiti; Muto, Masaki; and Saito, Naohito, to Dainippon Ink and Chemicals, Inc , and Yushiro Chemical Industry Co , Ltd Composition for temporary protection paint 5,006,578, Cl 524-128.000.

Masujima, Katsuhiro *See*—
Kimura, Yuichiro, Kabuto, Nobuaki, Takashimizu, Satoru, and Masujima, Katsuhiro, 5,006,739, Cl. 307-270.000.

Mate, David W *See*—
Binversie, Gregory J.; Macier, James E ; and Mate, David W , 5,005,535, Cl 123-52.00M.

Materna, Richard H., Linse, John S., and Richardson, Roy A., to Materna, Richard H , and Linse, John S Payment Authorization and Information Device 5,007,084, Cl 380-24.000.

Mathews, Herbert H., and Welch, Joseph L., to Coburn Optical Industries, a Division of Pilkington Visioncare, Inc. Lens blocking apparatus 5,005,633, Cl 164-334.000

Mathews, Ronald J , and Woodings, Robert T , to Woodings Industrial Corporation Extension bar for blast furnace tap hole drill 5,005,807, Cl 266-271.000

Mathivat, Denis, Colmon, Daniel, and Philibert, Daniel, to Saint-Gobain Vitrage Apparatus for bending glass plates into convex shape 5,006,146, Cl 65-273.000

Matjukhina, Ljudmila I , Mikhalev, Alexandr S.; Sidoruk, Sergei N.; and Chushenkov, Igor M , to Belorussky Gosudarstvenny Universitet Imeni V I Lenina Gate-controlled electric drive. 5,006,776, Cl. 318-723.000.

Matsuda, Hiroshi *See*—
Haruta, Masahiro, Matsuda, Hiroshi, Munakata, Hirohide, and Nishimura, Yukuo, 5,006,446, Cl 430-270.000

Anderson, Dirk M.; Baker, Paul E., Cantrell, Michael A., Cerretti, Douglas P., Cosman, David J.; Gimpel, Steven D., Grabstein, Kenneth H.; Larsen, Alf D.; and McKereghan, Kate N., 5,006,465, Cl. 435-69.520

McKubre, Michael C. H.; and Syrett, Barry C., to Electric Power Research Institute, Inc. Device for in situ monitoring of corrosion rates of polarized or unpolarized metals. 5,006,786, Cl. 324-71.200

McLeod, Rick, and Palmer, Gary E., to Hako Minuteman, Inc. Adapter for mounting vacuum motor. 5,005,251, Cl. 15-327.100.

McLochlin, David M. *See—*
Fultz, William A.; and McLochlin, David M., 5,005,693, Cl. 198-781.000

McMurtry, J. A. Solar energy system for generating electricity. 5,005,360, Cl. 60-659.000.

McNamee, John A. *See—*
VanBortel, David P., McNamee, John A.; and Lin, Luke C., 5,006,396, Cl. 428-189.000

McNelley, Jerald R. In-line fuel heater. 5,005,551, Cl. 123-557.000

McNew, Quinton B. *See—*
Edwards, John W., Harper, Daniel R., and McNew, Quinton B., 5,005,921, Cl. 305-35.0EB.
Edwards, John W., Harper, Daniel R.; and McNew, Quinton B., 5,005,922, Cl. 305-35.0EB

McShane, Michael B., Lin, Paul T., and Wilson, Howard P., to Motorola, Inc. Packaged semiconductor device having a low cost ceramic PGA package. 5,006,922, Cl. 357-74.000.

McWhorter, David J., Williams, Bolie C., III, Childs, Eric G., and Schaeper, Gary R., to Cooper Industries, Inc. Variable bore packer for a ram type blowout preventer. 5,005,802, Cl. 251-1.300.

Meagher, James P. *See—*
Smith, John W., and Meagher, James P., 5,006,677, Cl. 200-61.890

Mecke, Norbert; and Schmedes, Albert, to Pelikan Aktiengesellschaft. Ink eradicator for inks containing triaryl methane dyestuffs. 5,006,171, Cl. 106-21.000

Med Inventio AG. *See—*
Heimbeck, Hans J., 5,005,960, Cl. 350-573.000.

Med-Safe Systems, Inc. *See—*
Shillington, Richard A., 5,005,793, Cl. 248-229.000

Medernach, Louis J., to Eagle Air Ltd. Crop lifter for swathers or combines. 5,005,346, Cl. 56-312.000.

Medical Engineering and Development Institute, Inc. *See—*
Fearnot, Neal E., and Evans, Merry L., 5,005,574, Cl. 128-419.0PG

Medtronic, Inc. *See—*
McDonald, Ray S., 5,006,115, Cl. 604-175.000

Meenan, Gary F. *See—*
Oblad, Hayward B.; and Meenan, Gary F., 5,006,231, Cl. 210-96.100

Meguro, Hiroshi. *See—*
Kosaka, Toru, Ohtsubo, Yoshiaki, and Meguro, Hiroshi, 5,006,700, Cl. 250-201.400.

Meguro, Yoshio. *See—*
Sakamoto, Seiji, Kawaguchi, Chikakazu, Meguro, Yoshio, Harada, Takashi, and Takisawa, Toshifumi, 5,006,589, Cl. 524-430.000

Meier, Albert H., Cincotta, Anthony H., and Martin, Donn D., to Louisiana State University. Method of treating a vertebrate animal to reduce plasma triglycerides and cholesterol levels and to alleviate and prevent atherosclerosis. 5,006,526, Cl. 514-250.000

Meier, Karl-Heinz. *See—*
Kothe, Karl-Peter; Gekeler, Manfred W., and Meier, Karl-Heinz, 5,006,701, Cl. 250-205.000.

Meier, Thomas. *See—*
Reinartz, Hans-Dieter; Steffes, Helmut; Von Hayn, Holger; and Meier, Thomas, 5,005,350, Cl. 60-562.000

Meijer, Egbert W., Ten Hoeve, Wolter, Nijhuis, Sjef, Rikken, Gerardus L. J. A., and Havinga, Edsko E., to U.S. Philips Corporation. Device for doubling the frequency of a light wave comprising a non-linear optical compound. 5,006,729, Cl. 307-425.000.

Meilink Industries, Inc. *See—*
Cufr, Robert J., 5,005,387, Cl. 70-86.000

Meltsner, Bernard R. *See—*
Kolich, Charles H., Meltsner, Bernard R., and Braxton, Henry G., Jr., 5,006,324, Cl. 423-300.000.

Melzer, Milena. *See—*
Kovacs, Jenoe, Melzer, Milena, Balz, Werner, Lenz, Werner; Loch, Werner, and Jakusch, Helmut, 5,006,406, Cl. 428-323.000

Atsuta, Mitsuru, Sakashita, Takeshi; Miyamoto, Ryoichi, Tanimura, Yukinori, and Fuji, Saburo, 5,006,340, Cl. 424-405.000.

Miyaoka, Satoshi, to Kabushiki Kaisha Kobe Seiko Sho. Cavitation-preventing pilot valve control system for power shovel hydraulic circuit. 5,005,466, Cl. 91-420.000

Miyasaka, Kenji, to Sony Corporation. Cassette loading device with a flat-cut cam follower. 5,006,944, Cl. 360-99.060

Miyatake, Takafumi: *See*—
Matsushima, Hitoshi, and Miyatake, Takafumi, 5,007,099, Cl. 382-41.000

Miyauchi, Tatsuo: *See*—
Uemura, Satoshi, Kawada, Susumu, Sekine, Yoshitada, and Miyauchi, Tatsuo, 5,005,277, Cl. 29-407.000

Miyoshi, Seiji, Fukuda, Misao, Yamato, Seiichi, Tokiwa, Kouji, and Maruyama, Kazuyoshi, to Fujitsu Limited. Digital adaptive filter and method of convergence therein. 5,007,044, Cl. 370-32.100

Mizuguchi, Shinichi: *See*—
Itoh, Tatsuo, Mizuguchi, Shinichi, Kubo, Keishi, and Sato, Takeo, 5,005,938, Cl. 350-96.180

Mizuno, Kotaro: *See*—
Adachi, Takeshi, Mizuno, Kotaro, Yamada, Shigeru, Suzuki, Hideo, and Kimpara, Mamoru, 5,005,459, Cl. 84-453.000

Mizuno, Toshiya, Teramoto, Yoshikichi, Saito, Takeshi, and Wakabayashi, Juichi, to Kureha Kagaku Kogyo K.K. Biaxially-stretched film made of poly(arylene sulfide) resin composition and production process thereof. 5,006,605, Cl. 525-189.000

Mizuoka, Seiji, and Okumura, Kazumasa, to Matsushita Electric Industrial Co., Ltd. Lead's position recognizing device. 5,007,097, Cl. 382-8.000.

MNM Enterprises, Inc.: *See*—
Little, Richard L., 5,005,584, Cl. 128-748.000

Mobacc B. V.: *See*—
Tempelman, Antonie P., 5,005,738, Cl. 222-402.190

Mobay Corporation: *See*—
Lundy, Charles E., White, Roger J., and Krishnan, Sivaram, 5,006,572, Cl. 523-136.000

Mobil Oil Corporation: *See*—
Andress, Harry J., Horodysky, Andrew G., and Kaminski, Joan M., 5,006,272, Cl. 252-49.600
Avery, Noyes L., Benjamin, Linda A., Horodysky, Andrew G. and Law, Derek A., 5,006,271, Cl. 252-45.000
Farng, Liehpao O., and Horodysky, Andrew G., 5,006,270, Cl. 252-42.700
Herbst, Joseph A., Owen, Hartley, and Schipper, Paul H., 5,006,497, Cl. 502-67.000
Hsieh, John T. T., and Pruden, Ann L., 5,006,506, Cl. 502-204.000
Jennings, Alfred R., Jr., and Smith, Roger C., 5,005,645, Cl. 166-280.000
Miro, Nemesio D., 5,006,618, Cl. 526-116.000
Pappal, David A., and Sarli, Michael S., 5,006,495, Cl. 502-42.000

Mobius, Dietmar: *See*—
Vogel Viola, and Mobius, Dietmar, 5,006,410, Cl. 428-411.100

Mochizuki, Akihiro: *See*—
Matsumaru, Shigeo Mochizuki, Akihiro, and Isoi, Syuzi, 5,006,415, Cl. 428-522.000
Nishio, Akira, Nakamura, Masato, and Mochizuki, Akihiro, 5,006,745, Cl. 310-177.000

Mochizuki, Takeshi, Katagiri, Shigenobu, Seino, Minoru, Ohshima, Minoru, Saito, Susumu, and Arimoto, Akira, to Hitachi Koki Co., Ltd., and Hitachi Ltd. Optical scanner and method for generating and detecting a composite dot on a scanning medium. 5,006,704, Cl. 250-235.000

Mochizuki, Takeshi: *See*—
Saito, Susumu, Arimoto, Akira, Mochizuki, Takeshi, Tsuji, Yasuyuki, Ohshima, Minoru, and Seino, Minoru, 5,006,705, Cl. 250-235.000

Modi, Jashawant J., and Banyai, Bruce E., to Aqualon Company. Water soluble polymers as alcohol replacement in lithographic fountain solutions. 5,006,168, Cl. 106-2.000

Modly, Zoltan M., to Engelhard Corporation. High infra-red reflecting brown rutile pigment compositions. 5,006,175, Cl. 106-439.000

Modrey, Henry J. Connector for optical fibers and the like. 5,005,940, Cl. 350-96.210

Moeglin, Steven J.: *See*—
Warmuth, Ivan J., II, and Moeglin, Steven J., 5,005,808, Cl. 267-64.270

Moeller, Robert F.: *See*—
Mainstone, Kenneth A., and Moeller, Robert F., 5,006,056, Cl. 425-186.000

Moeschler, Heinrich F.: *See*—
Hector, Richard F., Schaller, Klaus, Moeschler, Heinrich F., and Plempel, Manfred, 5,006,513, Cl. 514-43.000

Mogulewsky, Martine, Nedelec, Lucien, Nique, Francois, and Philibert, Daniel, to Roussel Uclaf. Novel 17β-hydroxy-19-nor-steroids. 5,006,518, Cl. 514-179.000

Mohaupt, Henry H. Gas generator with improved ignition assembly. 5,005,641, Cl. 166-63.000

Mohrs, Klaus-Helmut; Fruchtmann, Romanis, and Kohlsdorfer, Christian, to Bayer Aktiengesellschaft. Substituted ethers, thioethers and amines for use as lipoxygenase inhibitors. 5,006,534, Cl. 514-311.000.

Mojden, Andrew E., to Fleetwood Systems, Inc. Apparatus for inspecting and packaging can ends. 5,005,340, Cl. 53-500.000

Mojonnier, Daniel K.: *See*—
Votava, Paul, III; and Mojonnier, Daniel K., 5,006,230, Cl. 210-94.000

Momose, Yutaka, Watanabe, Tetsumi, and Yamaguro, Akira, to Aisin Seiki Kabushiki Kaisha. Stirling engine. 5,005,349, Cl. 60-517.000

Monarch Marking Systems, Inc.: *See*—
Benge, S. Eugene; and Froning, Robert L., 5,006,856, Cl. 340-572.000

Monckton, Susan P.: *See*—
Pope, Brent K.; Monckton, Susan P.; and Nath, Kaser R., 5,006,348, Cl. 426-40.000

Mondek, Martin J.: *See*—
Bland, Gerald F.; Mondek, Martin J.; and Zdanowicz, Lawrence E., 5,006,085, Cl. 440-75.000

Monico, Juan A., to Catene Systems Corporation. Segmented backplane for multiple microprocessing modules. 5,006,961, Cl. 361-413.000

Monma, Shigeki: *See*—
Ishizuka, Masaru, Yokono, Yasuyuki; Matsuura, Asako; Kamei, Yoshio, Ohashi, Hiromichi, Kitagawa, Mitsuhiko Sasaki, Tomiya; and Monma, Shigeki, 5,006,921, Cl. 357-74.000

Moore, Boyd B., to Shell Oil Company. Logging tool centralizer. 5,005,642, Cl. 166-241.000

Moore, Glynard: *See*—
Moore, Wayland F., and Moore, Glynard, 5,005,291, Cl. 30-244.000

Moore, Kevin D.: *See*—
Yourgalite, Ray A., Moore, Malcolm, Chamberlain, Neal C., Beeicka, Kenneth F., Hilgeman, Samuel J., and Moore, Kevin D., 5,005,335, Cl. 53-399.000

Moore, Malcolm: *See*—
Yourgalite, Ray A., Moore, Malcolm, Chamberlain, Neal C., Beeicka, Kenneth F.; Hilgeman, Samuel J., and Moore, Kevin D., 5,005,335, Cl. 53-399.000

Moore, Wayland F., and Moore, Glynard. Livestock dehorner. 5,005,291, Cl. 30-244.000

Moran, Kevin P.: *See*—
Goth, Gary F., Moran, Kevin P., and Zumbrunnen, Michael L., 5,005,638, Cl. 165-80.400

Morbark Industries, Inc.: *See*—
Morey, Norval, 5,005,620, Cl. 144-373.000

Morcher, Bernhard: *See*—
Vetter, Hans, Ohlschlager, Hans, Odenwalder, Heinrich, Morcher, Bernhard, Sommer, Friedhelm; and Rosenhahn, Lothar, 5,006,457, Cl. 430-613.000

Morey, Norval, to Morbark Industries, Inc. Drum-type wood chipper. 5,005,620, Cl. 144-373.000

Morgan, Mary A.: *See*—
Eldridge, John D., Jr., and Morgan, Mary A., 5,005,590, Cl. 128-849.000

Mori, Fumihiko: *See*—
Yasunobu, Chizuko, Mori, Fumihiko, Ohata, Hideo, Udagawa, Mari, Inaba, Keiichiro, Hida, Kenichi, and Satoh, Yumiko, 5,006,998, Cl. 364-513.000

Mori, Kazumi: *See*—
Kurachi, Yasuhiko, Mori, Kazumi; and Koizumi, Hisao, 5,006,689, Cl. 392-450.000

Mori, Kei. Light radiator. 5,005,931, Cl. 350-96.100

Mori, Nobufumi; Ohnishi, Masahiro, Miyahara, Junji, Oikawa, Tetsuo, and Harada, Yoshiyasu, to Fuji Photo Film Co., Ltd., and Jeol Ltd. Electron microscope image recording and read-out method. 5,006,707, Cl. 250-311.000

Mori, Shinichi: *See*—
Murakami, Masanori, Hamada, Akiyoshi, Yagoto, Mitsutoshi, and Mori, Shinichi, 5,006,874, Cl. 354-212.000

Mori, Shinji, Buma, Kozi, and Shinto, Hiroaki, to Kabushiki Kaisha Tokai-Rika Denki-Seisakusho. Air bag assembly mounting mechanism. 5,005,860, Cl. 280-731.000

Mori, Takayuki: *See*—
Kasuga, asao, Mori, Takayuki, and Tsukada, Nobuo, 5,006,746, Cl. 310-323.000

Mori, Toshihiro: *See*—
Koizumi, Yutaka, Nozawa, Minoru, Mori, Toshihiro, and Saito, Atsushi, 5,006,867, Cl. 346-140.00R

Mori, Yoshinori: *See*—
Hatano, Sakae; Takada, Yoshiharu, Kainuma, Kiyokazu, Kanematsu, Isao; Asano, Kazuo; Yoshida, Hisashi, and Mori, Yoshinori, 5,006,685, Cl. 219-69.200.

Morigaki, Masakazu; Ishikawa, Takatoshi, Andoh, Kazuto; Seto, Nobuo, Koshimizu, Toshio; and Ueda, Shinji, to Fuji Photo Film Co., Ltd. Method for processing silver halide color photographic light-sensitive materials using sulphinc acids and salts or their precursors. 5,006,456, Cl. 430-372.000.

Morikawa, Asao; and Kondo, Kazuo, to NGK Spark Plug Co., Ltd. Metallizing composition. 5,006,167, Cl. 106-1.180.

Morikawa, Atsushi: *See*—
Yonezawa, Yasuo, Ohnishi, Toshiya; Okumura, Shin'ichi, Sakai, Akiyoshi, Nakano, Hiroki; Matsushita, Masao; Morikawa, Atsushi, and Yoshihara, Motoshi, 5,005,371, Cl. 62-238.600

Moriki, Yasumitsu, and Numakura, Hirotomo, to Maruma Jyusharyo Kabushiki Kaisha. High torque hydraulic shoe bolt wrench. 5,005,654, Cl. 173-12.000

Morin, Francois, to Etat Francais Represente Par le Ministere des Postes. Giant liquid crystal display means. 5,005,950, Cl. 350-333.000

Morisawa, Kunio: *See*—
Itoh, Hiroshi, Sugaya, Masami, Soga, Yoshinobu; Morisawa, Kunio, Habuchi, Ryoji, Kouno, Katsumi; and Hattori, Yuji, 5,006,093, Cl. 474-28.000

Morita, Kunihiko, to Nippon Thompson Co., Ltd. Rectilinear motion rolling guide unit. 5,005,987, Cl. 384-43.000.

Morita, Masaya: *See*—
Watanabe, Tsutomu, Sagiyama, Masaru; Kawabe, Masaki, and Morita, Masaya, 5,006,420, Cl. 428-629.000

Morris, Daryl W.: *See*—
Dooley, R. Dennis, Morris, Daryl W.; Scott, Dana L.; and Watts, Jimmy A., 5,005,245, Cl. 15-104.040

Morris, Gene A., Patel, Deepak C., and Sternenberg, James E., to Daniel Industries, Inc. Lift-turn valve and actuator assembly. 5,005,805, Cl. 251-229.000.

Morris, Jean E.: *See*—
Bortione, Pierluigi A., Caizzi, Vittorio; Marzupio, Maurizio; and Morris, Jean E., 5,006,215, Cl. 204-253.000

Morris, Scott S.; McGehee, Danny B., and Canham, Randolph S., to Bull HN Information Systems Inc. Dust containment cap for a printing device employing toner. 5,006,894, Cl. 355-215.000.

Morris, Victoria J.: *See*—
Maroulis, Peter J.; Clark, Patrick J.; Morris, Victoria J.; Byerley, Robert A., and Booker, John, 5,006,315, Cl. 422-89.000.

Moshe, Bill L. Overarm router shaper. 5,005,616, Cl. 144-134.00A.

Moss, Stanley H., to Adria Limited. Hosiery finishing apparatus. 5,005,381, Cl. 66-149.00S

Mottschke, Lothar, and Tronnier, Hagen, to Marbert GmbH. Medicinal compositions based on spent brewers' grains extract, a process for the preparation thereof, and the use of spent brewers' grains extract for the preparation of cosmetic compositions, and a special brewers' grains extract. 5,006,337, Cl. 424-195.100.

Motonari, Kazunori; Kumamoto, Kazuo; Turuda, Shigeto, Ito, Yutaka, and Mitsutake, Taiichiro, to Ube Industries, Ltd., and Chukoh Chemical Industries, Ltd. Polyimide film having fluorocarbon resin layer. 5,006,411, Cl. 428-421.000.

Motorola Inc.: *See*—
Bogut, Henry A., Dolezal, Anthony; and Fernandez, Jose M., 5,006,676, Cl. 200-61.520.
Davies, Robert B., 5,006,736, Cl. 307-570.000.
Davis, Darrell E., 5,006,730, Cl. 307-446.000.
Drake, Herbert G., Jr., 5,006,760, Cl. 315-111.210
Earle, Richard W., 5,006,190, Cl. 156-247.000.
Fay, Gary V., 5,006,737, Cl. 307-571.000.
Freyman, Bruce J.; Miles, Barry M., and Flaugher, Jill L., 5,006,673, Cl. 174-255.000
Kosa, Yasunobu, 5,006,909, Cl. 357-23.600.
McShane, Michael B., Lin, Paul T., and Wilson, Howard P., 5,006,922, Cl. 357-74.000
Mennona, Vincent J., Jr., 5,006,073, Cl. 439-77.000.
Miller, John E., and Lambrecht, Frank E., 5,006,861, Cl. 343-848.000.
Prioste, Jerry E., and Nelson, Keith, 5,006,820, Cl. 333-33.000
Schucker, Douglas W., 5,006,486, Cl. 437-220.000
Sivan, Richard D., 5,006,911, Cl. 357-23.110.

Mountain Equipment Limited: *See*—
Hutchinson, Peter M., 5,005,236, Cl. 5-413.000

MSP Corporation: *See*—
Behm, Steven M., Marple, Virgil A., and Burton, Robert M., 5,006,227, Cl. 209-143.000

MTS Schweinfurt GmbH: *See*—
Metzner, Dieter, 5,006,112, Cl. 604-155.000

MTU Motoren-und Turbinen-Union Muenchen GmbH: *See*—

Klemann, Lawrence P., Finley, John W., and Seimone, Anthony, 5,006,351, Cl 426-611.000
Verrico, Marsha K., 5,005,514, Cl 118-16.000

Nachtrab, Rainer *See*—
Fath, Wolfgang, Nachtrab, Rainer, and Polster, Rudolf, 5,006,173, Cl 106-419.000

Nagai, Mitsuharu *See*—
Yoshie, Tatsuo, and Nagai, Mitsuharu, 5,006,979, Cl 364-200.000

Nagamatsu, Tsutomu *See*—
Washizu, Takehiro, and Nagamatsu, Tsutomu, 5,005,534, Cl 123-52.00M
Washizu, Takehiro, and Nagamatsu, Tsutomu, 5,005,553, Cl 123-572.000

Nagano, Masato *See*—
Kumagai, Motoo, Kato, Kenichi, Takeuti, Humio, Nagano, Masato, and Sakaguchi, Michiaki, 5,006,957, Cl 361-321.000

Nagano Nihon Musen K.K *See*—
Kuroiwa, Yoshihiko, 5,006,865, Cl 346-76.0PH

Nagasawa, Kiyoshi, Ono, Kozo, Ogata, Kojiro, Murayama, Ken, and Hoshino, Yoshihiro, to Hitachi Construction Machinery Co., Ltd, Displacement controller for fine positioning device, 5,005,298, Cl 33-573.000

Nagase, Tsuneyuki *See*—
Touji, Daijiro, Nakahara, Akihiro, Nakashita, Takefumi, Mitsuba, Atsuko, Nakashio, Yukiyasu, and Nagase, Tsuneyuki, 5,006,586, Cl 524-377.000

Nagata, Hirofumi, to Kyoei Steel Ltd, Method for disposal of medical waste materials, 5,005,496, Cl 110-346.000

Nagata, Kojiro, to Tachi S Co., Ltd, Automotive seat with suspension device, 5,005,894, Cl 296-68.100

Nagata, Osamu *See*—
Maruyama, Fumio, Suyama, Tomio, Kamino, Hiroaki, Suyama, Koji, Kuwahara, Tokihiro, and Nagata, Osamu, 5,006,767, Cl 318-103.000

Nagata, Shinichi, Kikkawa, Atsushi, and Endo, Kenji, to Dainippon Screen Mfg. Co., Ltd, Illumination system, 5,005,959, Cl 350-452.000

Nagata, Shoichi *See*—
Ohashi, Kunio, and Nagata, Shoichi, 5,006,843, Cl 355-27.000

Nagata, Takefumi *See*—
Itoh, Wataru, Nakajima, Nobuyoshi, and Nagata, Takefumi, 5,006,708, Cl 250-327.200

Nagato, Hiroyasu *See*—
Matsuo, Hirokazu, and Nagato, Hiroyasu, 5,006,904, Cl 355-313.000

Nagato, Hitoshi *See*—
Ohno, Tadayoshi, Nagato, Hitoshi, and Kanai, Tsutomu, 5,005,993, Cl 400-120.000

Nagel, Ferenc, and Farkasne, Maria J., to Tungsram Reszvenytarsasag, Soldering enamel for preparing an end seal of a ceramic discharge envelope of a discharge lamp, 5,006,489, Cl 501-15.000

Nagy, Lajos *See*—
Sarkozy, Peter, Pap, Laszlo, Szego, Andras, Nagy, Lajos, Szekely, Istvan, Marmarosi, Katalin, and Grosch, Janos, 5,006,545, Cl 514-395.000

Nahas, Nicholas C *See*—
Gardiner, John B., Loffredo, Anthony A., Bloch, ricardo, Nahas, Nicholas C., Ingold, Keith U., and Kowalchyn, Theodore V., 5,006,608, Cl 525-370.000

Naito, Toshihiko *See*—
Kamiya, Takashi, Naito, Toshihiko, Negi, Shigeto, Komatu, Yuuki, Kai, Yasunobu, Nakamura, Takaharu, Sugiyama, Isao, Machida, Yoshimasa, Nomoto, Senichiro, Kitoh, Kyosuke, Katsu, Kanemasa, and Yamauchi, Hiroshi, 5,006,649, Cl 540-222.000

Najjar, Mitri S., and Muan, Arnulf, to Texaco Inc, Slag resistant thermocouple sheath, 5,005,986, Cl 374-179.000

Naka, Michiro *See*—
Nakane, Toshio, Naka, Michiro, Konuma, Hiroaki, and Hijikata, Kenji, 5,006,634, Cl 528-272.000

Nakada, Akira *See*—
Suzuki, Hideo, Matsushima, Shunichi, Obata, Masahiko, Sakama, Masao, Nakada, Akira, and Kumano, Shinji, 5,005,460, Cl 84-600.000

Nakagaki, Shintaro *See*—
Takanashi, Itsuo, Nakagaki, Shintaro, and Shinonaga, Hirohiko, 5,006,935, Cl 358-300.000

Nakagawa, Kiyoshi *See*—
Aida, Kazuo, Nishi, Shigendo, and Nakagawa, Kiyoshi, 5,005,937, Cl 350-96.160

Nakahara, Akihiro *See*—
Touji, Daijiro, Nakahara, Akihiro, Nakashita, Takefumi, Mitsuba, Atsuko, Nakashio, Yukiyasu, and Nagase, Tsuneyuki, 5,006,586, Cl 524-377.000

Nakai, Kenichiro, and Nakanishi, Yoshinori, to Otis Elevator Company, Air gap apparatus for a linear motor, 5,005,672, Cl 187-17.000

Nakai, Masaaki, to Minolta Camera Kabushiki Kaisha, Exposure calculating device, 5,006,876, Cl 354-400.000

Nakajima, Masaitsu, to Matsushita Electric Industrial Co., Ltd, Processing circuit having an error detecting and correcting circuit therein, 5,007,056, Cl 371-37.100

Nakajima, Nobuyoshi *See*—
Itoh, Wataru, Nakajima, Nobuyoshi, and Nagata, Takefumi, 5,006,708, Cl 250-327.200

Nakajima, Takanori *See*—
Kaneko, Masaharu, and Nakajima, Takanori, 5,006,276, Cl 252-299.100

Nakamura, Hiroyuki, to Canon Kabushiki Kaisha, Semiconductor circuit having buffer function, 5,006,732, Cl 307-473.000

Nakamura, Katsunari, Ueda, Kenichiro, Irie, Yoshirou, Hoshi, Tsuyokazu, and Kawakami, Motozo, to Fuji Electric Co., Ltd, System of conveying, storing, retrieving and distributing articles of manufacture, 5,006,996, Cl 364-478.000

Nakamura, Kazuo *See*—
Miyamoto, Osamu, Kanou, Hideki, Nakamura, Kazuo, Imai, Takashi, and Nishida, Kenichi, 5,006,829, Cl 340-453.000

Nakamura, Kiyokazu, Kometani, Kiichi, Koshino, Akihiko, and Horiuchi, Kenjiro, to Toray Industries, Inc, Composition of aromatic polyester, modified polyphenylene ether and diglycidyl dicarboxylate, 5,006,610, Cl 525-396.000

Nakamura, Kunie *See*—
Kakimoto, Norihiro, Kumano, Kazuo, and Nakamura, Kunie, 5,006,553, Cl 514-492.000

Nakamura, Makoto *See*—
Nishi, Norihisa, Nakamura, Makoto, and Noguchi, Satoshi, 5,006,353, Cl 426-231.000

Nakamura, Masato *See*—
Nishio, Akira, Nakamura, Masato, and Mochizuki, Akihiro, 5,006,745, Cl 310-157.000

Nakamura, Noboru *See*—
Niide, Kazuo, Yamada, Hideki, Higashi, Haruki, and Nakamura, Noboru, 5,005,663, Cl 180-247.600

Nakamura, Nobuaki *See*—
Shikunami, Junichi, Itonaga, Makoto, Kayanuma, Kanji, Kai, Masakatsu, and Nakamura, Nobuaki, 5,006,703, Cl 250-231.130

Nakamura, Takaharu *See*—
Kamiya, Takashi, Naito, Toshihiko, Negi, Shigeto, Komatu, Yuuki, Kai, Yasunobu, Nakamura, Takaharu, Sugiyama, Isao, Machida, Yoshimasa, Nomoto, Senichiro, Kitoh, Kyosuke, Katsu, Kanemasa, and Yamauchi, Hiroshi, 5,006,649, Cl 540-222.000

Nakamura, Toshiya *See*—
Kishi, Hiroshi, Chazono, Hirokazu, Oshio, Minoru, Saito, Hiroshi, Nakamura, Toshiya, and Shizuno, Hisamitsu, 5,006,954, Cl 361-321.000
Kishi, Hiroshi, Chazono, Hirokazu, Oshio, Minoru, Saito, Hiroshi, Nakamura, Toshiya, and Shizuno, Hisamitsu, 5,006,955, Cl 361-321.000

Nakamura, Yasuo *See*—
Ohba, Nobuyuki, Ikeda, Atsuhiko, Matsunari, Kenji, Yamada, Yuji, Hirata, Michiya, Nikamura, Yasuo, Takeuchi, Akira, and Karino, Hiroyuki, 5,006,157, Cl 71-95.000

Nakamura, Yukihiro *See*—
Sugiyama, Yuichi, Isono, Takashi, Nakamura, Yukihiro, Takarwa, Akihiro, and Komatsubara, Kenichi, 5,006,160, Cl 71-111.000

Nakane, Kazuhiko, Furukawa, Teruo, Shiramoto, Masayoshi, and Yoshimoto, Kyosuke, to Mitsubishi Denki Kabushiki Kaisha, Method and apparatus for producing an accurate error signal in an optical recording medium driver, 5,007,038, Cl 369-44.110

Nakane, Toshio, Hijikata, Kenji, and Kageyama, Yukihiko, to Polyplastics Co., Ltd, Synthetic resin composition, 5,006,581, Cl 524-266.000

Nakane, Toshio, Naka, Michiro, Konuma, Hiroaki, and Hijikata, Kenji, to Polyplastics Co., Ltd, Flame-retardant halogenated copolyester and electric wire coated with the same, 5,006,634, Cl 528-272.000

Nakanishi, Yoshinori *See*—
Nakai, Kenichiro, and Nakanishi, Yoshinori, 5,005,672, Cl 187-17.000

Nakano, Hiroki *See*—
Yonezawa, Yasuo, Ohnishi, Toshiya, Okumura, Shin'ichi, Sakai, Akiyoshi, Nakano, Hiroki, Matsushita, Masao, Morikawa, Atsushi, and Yoshihara, Motoshi, 5,005,371, Cl 62-238.600

Nakano, Masami, and Abe, Takao, to Shin-Etsu Handotai Co., Ltd, Method of inspecting bonded wafers, 5,007,071, Cl 378-74.000

Nakano, Masaru *See*—
Kuno, Toshitaka, Koide, Mitsuo, Nakano, Masaru, Hayashi, Chisao, Kato, Yoshito, and Ishiguro, Yasuo, 5,006,999, Cl 364-513.000

Nakashima, Seiichiro, Toyoda, Kenichi, and Torii, Nobutoshi, to Fanuc, Ltd, Industrial robot, 5,006,035, Cl 414-680.000

Nakashio, Yukiyasu *See*—
Touji, Daijiro, Nakahara, Akihiro, Nakashita, Takefumi, Mitsuba, Atsuko, Nakashio, Yukiyasu, and Nagase, Tsuneyuki, 5,006,586, Cl 524-377.000

Nakashita, Takefumi *See*—
Touji, Daijiro, Nakahara, Akihiro, Nakashita, Takefumi, Mitsuba, Atsuko, Nakashio, Yukiyasu, and Nagase, Tsuneyuki, 5,006,586, Cl 524-377.000

Nakata, Yoshiro *See*—
Tsutsu, Noriko, Nakata, Yoshiro, and Esaki, Hideya, 5,006,717, Cl 250-484.100

Nakaya, Teruomi *See*—
Okamoto, Osamu, Nakaya, Teruomi, Suzuki, Seizo, Kuwano, Naoaki, Sakai, Yoshinori, Oda, Hiroshi, Uegusa, Masao, and Iba, Goji, 5,005,786, Cl 244-161.000

Nakayama, Toru, Yoshizumi, Hajime, Yamamoto, Hiroshi, and Yoshizawa, Kiyoshi, to Suntory Limited, and National Tax Administration, Novel urease and method of producing the same, 5,006,468, Cl 435-228.000

Nakayama, Yoshiro, to Mitsubishi Denki K.K, Wire cut electric discharge machine, 5,006,691, Cl 219-69.120

Nalco Chemical Company *See*—
Hoots, John E., and Banks, Rodney H., 5,006,311, Cl 422-62.000
Huang, Shu Jen W., and Stenger, Claudia V., 5,006,261, Cl 210-712.000

Nankai Kogyo Kabushiki Kaisha, *See*—
Shimizu, Yoichi, 5,005,607, Cl 139-91.000

Nann, Steven R *See*—
Gantzhorn, John E., Jr., and Nann, Steven R., 5,006,182, Cl 156-089.000

Nanno, Takanobu *See*—
Sawada, Kouji, Miya, Yasuhiro, Tanabe, Masato, Nanno, Takanobu, and Miyakawa, Shinji, 5,005,810, Cl 267-140.100

Naoi, Yoshitake *See*—
Itoh, Kazuo, Naoi, Yoshitake, Matsushita, Hajime, Ebata, Takashi, and Kawakami, Hiroshi, 5,006,646, Cl 536-23.000

Nara, Yasuhiro, and Matsumoto, Tatsuro, to Fujitsu Limited, System for synthesizing speech having fluctuation, 5,007,095, Cl 381-51.000

Narechania, Pradeep *See*—
Corel, Dale C., Tamosaitis, Anthony, and Narechania, Pradeep, 5,006,783, Cl 323-263.000

Narita, Yasushi, to Nissan Motor Co., Ltd, Line pressure control for automatic transmission, 5,005,441, Cl 74-866.000

Naron, Patricia J *See*—
Ruch, Mark H., Paulsel, Roger Q., and Naron, Patricia J., 5,005,817, Cl 271-9.000

Nath, Kaser R *See*—
Pope, Brent K., Monckton, Susan P., and Nath, Kaser R., 5,006,348, Cl 426-40.000

National Aerospace Laboratory of Science & Technology Agency, *See*—
Okamoto, Osamu, Nakaya, Teruomi, Suzuki, Seizo, Kuwano, Naoaki, Sakai, Yoshinori, Oda, Hiroshi, Uegusa, Masao, and Iba, Goji, 5,005,786, Cl 244-161.000

National Machinery Company, The *See*—
Hite, William H., and Allebach, Gene E., 5,005,397, Cl 72-405.000

National Research Council of Canada *See*—
Cherwonogrodzky, John W., Duncan, J. Robert, Nielsen, Klaus, Wright, Peter F., Bundle, David R., and Perry, Malcolm B., 5,006,463, Cl 435-7.320

National Research Development Corporation *See*—
Jones, Robert L., and Wilson, Norman H., 5,006,539, Cl 514-357.000
Schram, Cornelius J., 5,006,266, Cl 210-748.000

National Tax Administration *See*—
Nakayama, Toru, Yoshizumi, Hajime, Yamamoto, Hiroshi, and Yoshizawa, Kiyoshi, 5,006,468, Cl 435-228.000

Nature Sleep Corporation *See*—
Freet, E. Thomas, 5,005,238, Cl 5-451.000

Navistar International Transportation Corp *See*—
Crandall, Jerry A., Witta, James A., and Bower, Stuart S., 5,006,078, Cl 439-521.000

Nawaki, Masaru, and Torimaru, Yasuo, to Sharp Kabushiki Kaisha, Pulse generator for use in an integrated circuit, 5,006,725, Cl 307-106.000

Naylor, Alan *See*—
Skidmore, Ian F., Lunts, Lawrence H. C., Finch, Harry, Naylor, Alan, and Campbell, Ian B., 5,006,556, Cl 514-539.000

NCR Corporation *See*—
Kallin, Fredrik L. N., Hamilton, Alistair R., and Luckhurst, Graham, 5,006,960, Cl 361-390.000
Talwalkar, Shashi G., 5,006,863, Cl 346-1.100

Neal, Roger *See*—
Taylor, Keith, and Neal, Roger, 5,005,661, Cl 180-219.000

NEC Corporation *See*—
Denda, Akira, 5,006,731, Cl 307-455.000
Kudoh, Kazuhiro, Nishiyama, Toshirou, and Anma, Sadayuki, 5,007,105, Cl 455-344.000
Ooi, Tomoyuki, Hotta, Toshinori, and Isoe, Yasuhito, 5,007,088, Cl 380-46.000
Tsuzuki, Kazuo, 5,007,045, Cl 370-94.100

NEC Electronics Inc *See*—
Goldberg, Edward, 5,006,773, Cl 318-696.000

Neches, Philip M., to Teradata Corporation, Relational database system having a network for transmitting colliding packets and a plurality of processors each storing a disjoint portion of database, 5,006,978, Cl 364-200.000

Nedelec, Lucien *See*—
Moguilewsky, Martine, Nedelec, Lucien, Nique, Francois, and Philibert, Daniel, 5,006,518, Cl 514-179.000

Neely, Marshall A *See*—
Taylor, Brooks E., and Neely, Marshall A., 5,005,498, Cl 112-80.320

Negabahn-Hagh, Mehrdad *See*—
White, Bert, and Negabahn-Hagh, Mehrdad, 5,006,854, Cl 341-172.000

Negi, Shigeto *See*—
Kamiya, Takashi, Naito, Toshihiko, Negi, Shigeto, Komatu, Yuuki, Kai, Yasunobu, Nakamura, Takaharu, Sugiyama, Isao, Machida, Yoshimasa, Nomoto, Senichiro, Kitoh, Kyosuke, Katsu, Kanemasa, and Yamauchi, Hiroshi, 5,006,649, Cl 540-222.000

Nehler, Hans-Juergen *See*—
Beltz, Dietmar, Nehler, Hans-Juergen, and Rozek, Werner, 5,006,981, Cl 364-200.000

Neisius, Horst *See*—
Loercks, Juergen, and Neisius, Horst, 5,006,140, Cl 65-3.100

Nelson, Keith *See*—
Proste, Jerry E., and Nelson, Keith, 5,006,820, Cl 333-33.000

Nelson, Steven Golf driving and putting exerciser and training aid 5,005,836, Cl 273-191.00R

Nelson, Thomas E. Thermal insulation jacket 5,005,531, Cl 122-494.000

Nelson, William R Apparatus for and method of making and delivering slush ice, 5,005,364, Cl 62-76.000

Nerger, Klaus K., Klein, Hans J., and Burkart, Gunther, to Mannesmann Aktiengelsellschaft, Gripper assembly for an industrial robot 5,005,889, Cl. 294-86.400

Netten, Adriaan *See*—
Eggink, Hendrik H. J., Friedrichs, Winand H. A. M., Netten, Adriaan, Van Der AA, Herman H. M., and Schuiteman, Martin W., 5,006,752, Cl 313-161.000

Neufeld, Herman, to Cherry Semiconductor Corporation, Power factor correction circuit, 5,006,975, Cl 363-80.000

Neuman, Guenter, and Haley, William J., to Borg-Warner Automotive, Inc, Continuously variable transmission power train configuration 5,006,092, Cl 474-8.000

Newkirk, Raymond K., and West, William G., to Forward Technology Industries, Inc, Multiple fixture apparatus for fusion bonding 5,006,197, Cl 156-514.000

Newman, Jack, and Farb, David I., to Rhone-Poulenc Rorer Pharmaceuticals Inc, Purification of von Willebrand Factor by affinity chromatography, 5,006,642, Cl 530-385.000

Ng, David *See*—
Jensen, William S., and Ng, David, 5,005,439, Cl 74-574.000

NGB Spark Plug Co., Ltd *See*—
Kawase, Hideyuki, Sahashi, Noboru, and Hashizume, Tamotsu, 5,006,143, Cl 65-43.000

NGK Insulators, Ltd *See*—
Kawasaki, Keiji, Sekiguchi, Michio, and Matsuhisa, Tadaaki, 5,005,417, Cl 73-593.000

NGK Spark Plug Co., Ltd *See*—
Morikawa, Asao, and Kondo, Kazuo, 5,006,167, Cl 106-1.180

Niederer, Kurt W., to Toter, Inc, Method of emptying a container 5,006,039, Cl 414-786.000

Niederprum, Klaus, to Ford Motor Company, Storing and transporting rack for body panels and other flat components 5,005,712, Cl 211-150.000

Niederst, Ken W *See*—
Nugent, Richard M., Jr., Niederst, Ken W., and Seiner, Jerome A., 5,006,381, Cl 428-35.400

Nielsen, Klaus *See*—
Cherwonogrodzky, John W., Duncan, J. Robert, Nielsen, Klaus, Wright, Peter F., Bundle, David R., and Perry, Malcolm B., 5,006,463, Cl 435-7.320

Niessen, Anton K *See*—
Hasker, Jan, Crombeen, Jacobus E., Niessen, Anton K., and Stoffelen, Henricus J. H., 5,006,753, Cl 313-346.00R

Nieuwkoop, Evert *See*—
Ewalds, Johannes M., Hordijk, Johan C., and Nieuwkoop, Evert, 5,005,393, Cl 70-277.000.

Nifco, Inc *See*—
Kobayashi, Yasutomo, and Kato, Tsuyoshi, 5,005,885, Cl 292-336.300.

Nigon, Christopher S. *See*—
Cullen, John S., Incorvia, Samuel A., Nigon, Christopher S., and Boczkowski, Frederick A., 5,005,763, Cl 239-57.000

Nihira, Syoichi *See*—
Tamura, Kozo, Kodato, Toshiharu, Nihira, Syoichi, Tsukamoto, Yasuhiro, and Iida, Akira, 5,006,780, Cl 320-54.000

Niide, Kazuo, Yamada, Hideki, Higashi, Haruki, and Nakamura, Noboru, to Mazda Motor Corporation, Four-wheel drive vehicle 5,005,663, Cl 180-247.000

Niimi, Mamoru *See*—
Takase, Isao, Takemoto, Haruki, Tatsuta, Mitsugu, Maseki, Shinobu, Kano, Takenori, Yokoyama, Fumitomo, and Niimi, Mamoru, 5,006,102, Cl 475-282.000.

Ninuma, Kiyoshi *See*—
Kobayashi, Junji, Tokoro, Hiroyoshi, Ninuma, Kiyoshi, Hosoya, Kensei, and Chiba, Masao, 5,006,898, Cl 355-253.000.

Niiya, Takahiro *See*—
Ishimaru, Shinji, Niiya, Takahiro, and Ishimaru, Kazuko, 5,005,326, Cl 52-167.00R.

Nijhuis, Sjef *See*—
Meijer, Egbert W., Ten Hoeve, Wolter, Nijhuis, Sjef, Rikken, Gerardus L. J. A., and Havinga, Edsko E., 5,006,729, Cl 307-425.000

Nikken Chemical Laboratory Co., Ltd. *See*—
Yoshida, Hajime, 5,006,169, Cl 106-2.000.

Nikkola, Donald E., to Technology Development Corporation Low density heat resistant intermetallic alloys of the Al_3Ti type. 5,006,054, Cl. 420-552.000.

Nikon Corporation. *See*—
Kosaka, Toru, Ohtsubo, Yoshiaki; and Meguro, Hiroshi, 5,006,700, Cl. 250-201.400
Ohshita, Koichi, 5,005,955, Cl. 350-423.000
Takagi, Tadao; and Sato, Toshihiro, 5,006,879, Cl. 354-413.000

Niksa, Andrew J. *See*—
Dietrich, Joseph J.; Niksa, Andrew J.; and Stewart, James J., 5,006,216, Cl. 204-257.000.

Nilaver, Gajanan. *See*—
Adelman, John P.; Bond, Chris T.; Nilaver, Gajanan, and Zimmerman, Earl A., 5,006,469, Cl. 435-240.100.

Nilstam, Bo. *See*—
Wennerbo, Orjan E. V.; and Nilstam, Bo, 5,005,467, Cl. 91-461.000

Nippon Conlux Co., Ltd. *See*—
Yukimoto, Koji; and Hayashi, Hiroshi, 5,005,688, Cl. 194-206.000.

Nippon Kokan Kabushiki Kaisha *See*—
Masuda, Sadakazu; Fujita, Fumio, Murakami, Tadayoshi, Yoshino, Masahiko, Yagi, Ryuichi; and Kamata, Masamoto, 5,006,181, Cl. 148-111.000

Nippon Oil Company, Limited. *See*—
Shikatani, Yutaka, Kataoka, Naoki; Shimo, Yoshiyuki, Kuroda, Nobuyuki, and Matsuura, Kazuo, 5,006,633, Cl. 528-230.000

Nippon Oil & Fats Co., Ltd. *See*—
Kumagai, Motoo, Kato, Keiichi; Takeuti, Humio; Nagano, Masato, and Sakaguchi, Michiaki, 5,006,957, Cl. 361-321.000

Nippon Paint Co., Ltd. *See*—
Umeda, Yasushi, and Satoh, Hisao, 5,006,447, Cl. 430-272.000

Nippon Seiko Kabushiki Kaisha. *See*—
Yamaguchi, Mikio, 5,005,862, Cl. 280-775.000.

Nippon Signal Co., Ltd., The *See*—
Sakurai, Masaaki; and Yoda, Mitsuru, 5,006,422, Cl. 428-694.000

Nippon Steel Chemical Co., Ltd. *See*—
Kawabe, Masanao; Kimura, Masao, Sugiyama, Kazuhiro; Yamaoka, Ikuro; and Inoue, Hiroharu, 5,006,631, Cl. 528-204.000

Nippon Steel Corporation. *See*—
Kawabe, Masanao; Kimura, Masao; Sugiyama, Kazuhiro; Yamaoka, Ikuro, and Inoue, Hiroharu, 5,006,631, Cl. 528-204.000

Nippon Telegraph and Telephone Corporation *See*—
Aida, Kazuo; Nishi, Shigendo, and Nakagawa, Kiyoshi, 5,005,937, Cl. 350-96.160.
Matsuoka, Takashi, and Sasaki, Toru, 5,006,908, Cl. 357-17.000

Nippon Telephone and Telegraph Public Corporation *See*—
Yoshizawa, Masahiro; Kikuchi, Akira, Wada, Kou; Fujinami, Minpei, and Shimazu, Nobuo, 5,006,795, Cl. 324-158.00R.

Nippon Thompson Co., Ltd. *See*—
Morita, Kunihiko, 5,005,987, Cl. 384-43.000.

Nique, Francois. *See*—
Moguilewsky, Martine, Nedelec, Lucien, Nique, Francois, and Philibert, Daniel, 5,006,518, Cl. 514-179.000

Nire, Takashi, and Watanabe, Takehito, to Kabushiki Kaisha Komatsu Seisakusho Method of manufacturing a thin film EL device by multisource deposition method 5,006,365, Cl. 427-66.000.

Nishi, Norihisa, Nakamura, Makoto, and Noguchi, Satoshi, to Taiyo Fishery Co., Ltd Process for the production of surimi. 5,006,353, Cl. 426-231.000

Nishi, Shigendo *See*—
Aida, Kazuo, Nishi, Shigendo, and Nakagawa, Kiyoshi, 5,005,937, Cl. 350-96.160

Nishida, Kenichi *See*—
Miyamoto, Osamu, Kanou, Hideki, Nakamura, Kazuo; Imai, Takeshi, and Nishida, Kenichi, 5,006,829, Cl. 340-459.000

Nishihara Environmental Sanitation Research Corporation Limited *See*—
Takeishi, Kazuo, Okubo, Yasuhiro, and Itoh, Takashi, 5,006,251, Cl. 210-618.000

Nishijima, Toyoki *See*—
Sasaki, Masao, Nishijima, Toyoki, Takada, Shun, and Onodera, Kaoru, 5,006,454, Cl. 430-546.000

Nishikawa, Kiyoshi Instrument for skin-stimulating therapy. 5,005,561, Cl. 128-60.000

Nishimura, Shozo, to Tanashin Denki Co. Ltd. Apparatus for preventing tape from being rolled 5,005,745, Cl. 226-24.000

Nishimura, Toshio, to Sharp Kabushiki Kaisha Reset circuit for electronic apparatus 5,007,014, Cl. 364-900.000

Nishimura, Yukuo *See*—
Haruta, Masahiro, Matsuda, Hiroshi, Munakata, Hirohide, and Nishimura, Yukuo, 5,006,446, Cl. 430-270.000

Nishimura, Yutaka *See*—
Tsukamoto, Masahide, Nishimura, Yutaka, and Fukui, Yasuo, 5,006,189, Cl. 156-247.000

Nishino, Tetsuo *See*—
Isono, Osamu, Fukui, Toshimasa, Nishino, Tetsuo, Tachibana, Tetsuo; and Iwabuchi, Eisuke, 5,007,055, Cl. 371-32.000

Nishio, Akira, Nakamura, Masato, and Mochizuki, Akihiro, to Victor company of Japan, Ltd Polyphase direct current motor 5,006,745, Cl. 310-177.000

Nishioka, Yoshiki *See*—
Iwahashi, Hiroyuki, Nishioka, Yoshiki, and Hakaridani, Mitsuhiro, 5,007,101, Cl. 382-42.000

Nishiyama, Jun *See*—
Ohmura, Kazumi, Nishiyama, Jun, and Chayama, Yukio, 5,005,487, Cl. 104-292.000.

Nishiyama, Toshirou *See*—
Kudoh, Kazuhiro, Nishiyama, Toshirou, and Anma, Sadayuki, 5,007,105, Cl. 455-344.000

Nishiyodo Air Conditioner Co., Ltd *See*—
Yonezawa, Yasuo, Ohnishi, Toshiya, Okumura, Shin'ichi, Sakai, Akiyoshi, Nakano, Hiroki; Matsushita, Masao, Morikawa, Atsushi; and Yoshihara, Motoshi, 5,005,371, Cl. 62-238.600

Nishizawa, Kazunori, Abe, Mitsutaka; Matsumoto, Hiroshi; and Imamura, Shinji, to Asmo Co., Ltd Vehicle windshield wiper 5,005,249, Cl. 15-250.270.

Nissan Motor Co., Ltd *See*—
Narita, Yasushi, 5,005,441, Cl. 74-866.000
Sugano, Kazuhiko, 5,005,443, Cl. 74-868.000
Uemura, Satoshi, Kawada, Susumu, Sekine, Yoshitada; and Miyauchi, Tatsuo, 5,005,277, Cl. 29-407.000

Nissei Industries. *See*—
Tokuhara, Chikara; and Hara, Tetsuro, 5,006,088, Cl. 445-27.000

Niwa, Yasushi *See*—
Tashima, Seiji; Okimoto, Haruo, Akagi, Toshimichi; and Niwa, Yasushi, 5,005,359, Cl. 60-600.000

Nix, Robert J. *See*—
Cheung, Nelson, Nix, Robert J., and Figiel, Janusz, 5,006,385, Cl. 428-57.000.

NKK Corporation *See*—
Watanabe, Tsutomu; Sagiyama, Masaru, Kawabe, Masaki, and Morita, Masaya, 5,006,420, Cl. 428-629.000

Noble, Stephen A., to Eastman Kodak Company. Image recording system and method 5,006,871, Cl. 354-76.000

Noel, Bruce W., Borella, Henry M., Cates, Michael R.; Turley, W Dale, MacArthur, Charles D., and Cala, Gregory C., to United States of America, Energy. Optical heat flux gauge 5,005,984, Cl. 374-29.000

Noelle, John A., and Noelle, Thomas J. Surface cleaning apparatus 5,005,253, Cl. 15-346.000

Noelle, Thomas J. *See*—
Noelle, John A., and Noelle, Thomas J., 5,005,253, Cl. 15-346.000

Noguchi, Hiroshi, and Kawada, Kazuo, to Stack Electronics Co., Ltd Connecting mechanism of central conductors of a coaxial cable and a probe 5,006,668, Cl. 174-75.00C

Noguchi, Satoshi *See*—
Nishi, Norihisa, Nakamura, Makoto; and Noguchi, Satoshi, 5,006,353, Cl. 426-231.000

Nojiri, Howard H., to Spectra-Physics, Inc Method and apparatus for mounting data gathering system 5,005,670, Cl. 186-61.000

Nokia Mobile Phones Ltd *See*—
Lonka, Pekka, 5,006,667, Cl. 174-35.00R.

Nolan, Richard G *See*—
Arvanitakis, Nicolaos C., BLack, Vincent J., Corley, Richard E., Jr., Nolan, Richard G., and Olson, Leonard T., Jr., 5,005,939, Cl. 350-96.200

Nomoto, Seiichiro *See*—
Kamiya, Takashi, Naito, Toshihiko, Negi, Shigeto; Komatu, Yuuki, Kai, Yasunobu, Nakamura, Takaharu, Sugiyama, Isao, Machida, Yoshimasa, Nomoto, Seiichiro, Kitoh, Kyosuke, Katsu, Kanemasa, and Yamauchi, Hiroshi, 5,006,649, Cl. 540-222.000

Nomura, Shoji *See*—
Hamashima, Shigeki, Koseto, Masaru, and Nomura, Shoji, 5,006,711, Cl. 250-349.000

Nonoshita, Hiroshi, and Saito, Seiji, to Canon Kabushiki Kaisha. Imaging data processing apparatus 5,006,937, Cl. 358-456.000

Noonenbruch, Heinz-Gerd, Heitmann, Ulrich, and Bormann, Heinrich, to Bayer Aktiengesellschaft, and Metzeler Schaum GmbH Process for the production of flam-retardant polyurethane foams 5,006,564, Cl. 521-54.000

Norden, Timothy D. *See*—
Szajewski, Richard P., Burns, Paul A., Poslusny, Jerrold N., Platt, Norma B., and Norden, Timothy D., 5,006,448, Cl. 430-505.000

Norling, Brian L. *See*—
Novack, Mitchell J., Norling, Brian L., and Woodruff, James R., 5,005,413, Cl. 73-517.0AV

North American Philips Corporation *See*—
Tsinberg, Mikhail, 5,006,926, Cl. 358-12.000

North American Philips Corp., Signetics Division *See*—
De Jong, Jan L. and DeGroot, Jacob G., 5,006,476, Cl. 437-31.000

North, Peter C., Cavalla, David J., and Black, Derek J M., to Glaxo Group Limited Imidazole derivatives and pharmaceutical use thereof 5,006,544, Cl. 514-385.000

Northcutt, Walter G., Jr *See*—
Holcombe, Cressie E., Northcutt, Walter G., Jr Masters, David R., and Chapman, Lloyd R., 5,006,306, Cl. 420-3.000

Northern Telecom Limited *See*—
Brown, Anthony K. D., 5,006,733, Cl. 307-521.000
Goulette, Richard R., Xavier, Stanilus K., and Greenfield, Raymond L., 5,006,788, Cl. 324-95.000
Popescu, Petre, 5,006,810, Cl. 328-167.000

Noto, Sal *See*—
Schulte, Harvey, and Noto, Sal, 5,005,981, Cl. 366-219.000

Novack, Mitchell J., Norling, Brian L., and Woodruff, James R., to Sundstrand Data Control, Inc Accelerometer with coplanar push-pull force transducers 5,005,413, Cl. 73-517.0AV

Noven Pharmaceuticals, Inc *See*—
LaPrade, Ronald E., 5,006,108, Cl. 604-20.000

Nowak, David J *See*—
Kar, Kishore K., and Nowak, David J., 5,006,265, Cl. 210-741.000.

Nowak, Michael T *See*—
Lewis, Thomas E.; Davidson, Bradley W., Williams, Richard A.; Nowak, Michael T., and Kline, John F., 5,005,479, Cl. 101-467.000.

Nowlan, Bud C. Ladder step support 5,005,668, Cl. 182-121.000.

Noyan, Ismail C.: *See*—
Bregman, Mark F.; Horton, Raymond R., Noyan, Ismail C., and Palmer, Michael J., 5,006,925, Cl. 357-82.000.

Nozawa, Minoru: *See*—
Koizumi, Yutaka; Nozawa, Minoru; Mori, Toshihiro, and Saito, Atsushi, 5,006,867, Cl. 346-140.00R

Nuclear Research Corp *See*—
Miller, John C.; Pandey, Sudhakar; and Pollock, Earl M., 5,006,713, Cl. 250-361.00R.

Nugent, Richard M., Jr., Niederst, Ken W., and Seiner, Jerome A., to PPG Industries, Inc Ungelled polyamine-polyepoxide resins. 5,006,381, Cl. 428-35.400.

Nukada, Katsumi: *See*—
Akasaki, Yutaka; Aonuma, Hidekazu, Hongo, Kazuya, Sato, Katsuhiro; Nukada, Katsumi; and Marumo, Teruumi, 5,006,435, Cl. 430-58.000.

Numakura, Hirotomo: *See*—
Moriki, Yasumitsu, and Numakura, Hirotomo, 5,005,654, Cl. 173-12.000.

Nuriya, Kozo *See*—
Kaneaki, Tetsuhiko, Oda, Mikio; Nuriya, Kozo, and Tani, Yasunori, 5,006,851, Cl. 341-155.000

Nyberg, Christopher A., Jackson, James G., and Brdicko, Jan, to ARC Sonics Inc. Sonic generator 5,005,773, Cl. 241-30.000

O/Y Kyro A/B, Tamglass Corp.: *See*—
Shafir, Aaron, 5,005,318, Cl. 51-5.00C

Oas, Robert H *See*—
Deyo, Charles C., Wolters, Thomas R., and Oas, Robert H., 5,005,283, Cl. 29-829.000

Obara, Haruki, and Izumiya, Syunzo, to Fanuc Ltd Gap voltage detector in a wire-cut electric discharge machine 5,006,693, Cl. 219-69.120.

Obata, Masahiko. *See*—
Suzuki, Hideo, Matsushima, Shunichi; Obata, Masahiko, Sakama, Masao, Nakada, Akira, and Kumano, Shinji, 5,005,460, Cl. 84-600.000

Oberkobusch, Doris *See*—
Wahle, Bernd, Herold, Claus-Peter, Zoellner, Wolfgang, Schiefer-stein, Ludwig, and Oberkobusch, Doris, 5,006,621, Cl. 526-262.000

Oberste-Padtberg, Rudiger, to Dowell Schlumberger Incorporated Process and composition for cementing wells passing through salt formations 5,006,177, Cl. 106-805.000

Oblad, Hayward B., and Meenan, Gary F., to Consolidation Coal Company Flocculant control system 5,006,231, Cl. 210-96.100.

O'Brien, Michael H *See*—
Weidner, Jerry R., Schuetz, Stanley T and O'Brien, Michael H., 5,006,142, Cl. 65-32.500

O'Brien, Michael J., to Eastman Kodak Company Device for converting a displacement in a direction into a force in the same direction 5,005,961, Cl. 350-611.000

O'Bryan, Henry M., Jr.; Rhodes, Warren W., and Thomson, John, Jr., to AT&T Bell Laboratories. Preparing superconducting ceramic materials 5,006,504, Cl. 505-1.000.

Obst, Frank, to Stocko Metallwarenfabriken Henkels und Sohn GmbH & Co Application apparatus. 5,005,752, Cl. 227-114.000

O'Connell, Mark, to Thomas Industries, Inc Compressor with a segmented piston rod assembly. 5,006,047, Cl. 417-238.000

Oda, Denichi *See*—
Takaki, Takeshi, Kaijiri, Kouhei, Oda, Denichi, Oda, Kunio, Kurihara, Hideo, and Tanabe, Takeshi, 5,006,603, Cl. 525-105.000

Oda, Hajime *See*—
Ogihara, Masuo, Oda, Hajime, Seki, Yoichi, and Yamazaki, Hiroshi, 5,006,880, Cl. 354-427.000

Oda, Hiroshi: *See*—
Okamoto, Osamu, Nakaya, Teruomi, Suzuki, Seizo, Kuwano, Naoaki, Sakai, Yoshinori, Oda, Hiroshi, Uegusa, Masao, and Iba, Goji, 5,005,786, Cl. 244-161.000

Oda, Kunio: *See*—
Takaki, Takeshi; Kaijiri, Kouhei, Oda, Denichi, Oda, Kunio, Kurihara, Hideo, and Tanabe, Takeshi, 5,006,603, Cl. 525-105.000

Oda, Mikio: *See*—
Kaneaki, Tetsuhiko, Oda, Mikio, Nuriya, Kozo, and Tani, Yasunori, 5,006,851, Cl. 341-155.000

Oda, Sennosuke. *See*—
Suzuki, Norio, Oda, Sennosuke, Maruyama, Hiromi; and Hoshino, Kenichi, 5,006,426, Cl. 429-94.000

Oda, Takumi, to Kanai Juyo Kogyo Company, Limited Stationary flat, top bar and carding engine. 5,005,260, Cl. 19-104.000

Odagaki, Toru, to Ushio Denki Kabushiki Kaisha Incandescent lamp 5,006,757, Cl. 313-623.000.

Odagawa, Tetsufumi, to Fujitsu Limited Bistable semiconductor laser diode device 5,007,061, Cl. 372-25.000

Odashima, Satoshi: *See*—
Egawa, Toshihiko, and Odashima, Satoshi, 5,005,949, Cl. 350-276.00R.

Odenwalder, Heinrich: *See*—
Vetter, Hans; Ohlschlager, Hans; Odenwalder, Heinrich; Morcher, Bernhard; Sommer, Friedhelm, and Rosenhahn, Lothar, 5,006,457, Cl. 430-613.000.

Odone, Paola: *See*—
Benedetto, Piero; Bezzi, Salvatore, and Odone, Paola, 5,005,898, Cl. 296-194.000.

O'Donnell, Matthew; Welles, Kenneth B., II; Crawford, Carl R., Pelc, Norbert J.; and Karr, Steven G., to General Electric Company Method and apparatus for coherent imaging system 5,005,419, Cl. 73-626.000.

Oe, Takanori; Sueoka, Hiroyuki; Hisadome, Masao, and Yamagami, Keiji, to Yoshitomi Pharmaceutical Industries, Ltd Fused pyrazole compounds and pharmaceutical use thereof. 5,006,520, Cl. 514-212.000.

Oemcke, Kenneth W., and Carmichael, Evan P., to Eastman Kodak Company. Film processor with absorbent roller to eliminate water spotting. 5,006,875, Cl. 354-299.000

Oettgen, Herbert F. *See*—
Yamaguchi, Hiroshi; Furukawa, Koichi, Livingston, Philip O., Lloyd, Kenneth O., Oettgen, Herbert F., Old, Lloyd J., and Fortunato, Sheila R., 5,006,470, Cl. 424-85.800

Office National d'Etudes et de Recherches Aerospatiales (ONERA) *See*—
Falempin, Francois, Sans, Claude; Champigny Patrick, Laruelle, Gerard, and Garrel, Jean-Marie, 5,005,782, Cl. 244-53.00B

O'Gallagher, Joseph J *See*—
Winston, Roland, Gleckman, Philip L., and O'Gallagher, Joseph J., 5,005,958, Cl. 350-442.000.

Ogasawara, Hiromitsu, to Tachi-S Co., Ltd Method and device for controlling headrest 5,006,771, Cl. 318-568.100

Ogata, Kojiro *See*—
Nagasawa, Kiyoshi, Ono, Kozo, Ogata, Kojiro, Murayama, Ken, and Hoshino, Yoshihiro, 5,005,298, Cl. 33-573.000.

Ogawa, Motosuke *See*—
Fukazawa, Hiromitsu, and Ogawa, Motosuke, 5,006,568, Cl. 521-98.000.

Ogawa, Ryota *See*—
Tejima, Yasuyuki, Ogawa, Ryota, and Sato, Makoto, 5,005,968, Cl. 353-122.000.

Ogawa, Shinji *See*—
Yoshinaka, Toshio; Hamano, Hideo, Minami, Hiroshi, and Ogawa, Shinji, 5,006,098, Cl. 475-86.000

Ogihara, Masuo, Oda, Hajime, Seki, Yoichi, and Yamazaki, Hiroshi, to Seikosha Co., Ltd. Programmable shutter 5,006,880, Cl. 354-427.000

Ogino, Sumihito, and Takahashi, Ryo, to Yokogawa Medical Systems, Limited Table mechanism 5,005,492, Cl. 108-145.000

Ogura, Mitsuru, to Sharp Kabushiki Kaisha Image forming apparatus 5,006,887, Cl. 355-72.000

Ohashi, Hiromichi *See*—
Ishizuka, Masaru, Yokono, Yasuyuki, Matsuura, Asako, Kamei, Yoshio, Ohashi, Hiromichi, Kitagawa, Mitsuhiko, Sasaki, Tomiya, and Monma, Shigeki, 5,006,921, Cl. 357-74.000

Ohashi, Kunio, and Nagata, Shoichi, to Sharp Kabushiki Kaisha Image forming apparatus 5,006,883, Cl. 355-27.000

Ohashi, Yutaka, to Mitsubishi Denki Kabushiki Kaisha Distributor and distributor rotor electrode. 5,006,674, Cl. 200-19.00R

Ohata, Hideo *See*—
Yasunobu, Chizuko, Mori, Fumihiko, Ohata, Hideo, Udagawa, Mari, Inaba, Kenichiro, Hida, Kenichi and Satoh, Yumiko, 5,006,998, Cl. 364-513.000.

Ohba, Kiyoshi *See*—
Emura, Tatuo, and Ohba, Kiyoshi, 5,006,350, Cl. 426-46.000

Ohba, Nobuyuki, Ikeda, Atsuhiko, Matsunari, Kenji, Yamada, Yuji, Hirata, Michiya, Nakamura, Yasuo, Takeuchi, Akira, and Karino, Hiroyuki, to Kumiai Chemical Industry Co., Ltd., and Ihara Chemical Industry Co., Ltd Pyrrolin-2-one compounds which are useful as herbicides 5,006,157, Cl. 71-95.000

Ohba, Toshihiro *See*—
Fujioka, Yoshide, Ohba, Toshihiro, Kanatani, Yoshiharu, and Uede, Hisashi, 5,006,838, Cl. 340-781.000

Ohcoshi, Shigeru, and Yoshinaga, Toshiaki, to Hitachi, Ltd Method for making of design reference and apparatus therefor 5,006,991, Cl. 364-474.200.

Ohio State University, The *See*—
Stevens, Vernon C., 5,006,334, Cl. 424-88.000

Ohlig, Ernest. Graphic material registration apparatus and method and vacuum hold down apparatus therefor 5,006,889 Cl. 355-91.000

Ohlschlager, Hans *See*—
Berthold, Werner, and Ohlschlager, Hans, 5,006,440, Cl. 430-429.000
Vetter, Hans, Ohlschlager, Hans, Odenwalder, Heinrich, Morcher, Bernhard, Sommer, Friedhelm, and Rosenhahn, Lothar, 5,006,457, Cl. 430-613.000

Ohmae, Katsuhiko, to Mitsubishi Denki Kabushiki Kaisha Vortex flowmeter. 5,005,425, Cl. 73-861.220

Ohmae, Katsuhiko, to Mitsubishi Denki Kabushiki Kaisha Karman vortex flowmeter with signal waveform shaper circuit 5,005,427, Cl. 73-861.220

Ohmori, Kenji: *See*—
Kuzuo, Ryuichi; Kawamoto, Atsushi, Tada, Junya; Ohmori, Kenji, and Sekiya, Hiroko, 5,006,388, Cl. 428-64.000

Ohmura, Kazumi, Nishiyama, Jun, and Chayama, Yukio, to Tsubakimoto Chain Company Linear motor driven conveying apparatus 5,005,487, Cl. 104-292.000.

Ohmura, Kunioki *See*—
Toya, Ichizo, Ohmura, Kunioki; and Okazaki, Masaki, 5,006,449, Cl. 430-508.000

Ohnishi, Masahiro *See*—
Mori, Nobufumi, Ohnishi, Masahiro, Miyahara, Junji, Oikawa, Tetsuo; and Harada, Yoshiyasu, 5,006,707, Cl. 250-311.000

Ohnishi, Toshiya *See*—
Yonezawa, Yasuo; Ohnishi, Toshiya, Okumura, Shin'ichi, Sakai, Akiyoshi, Nakano, Hiroki, Matsushita, Masao, Morikawa, Atsushi, and Yoshihara, Motoshi, 5,005,371, Cl. 62-238.600

Ohnishi, Tsuyoshi Therapeutic usages of inhibitors for a potassium efflux channel 5,006,512, Cl. 514-21.000

Ohno, Tadayoshi, Nagato, Hitoshi, and Kanai, Tsutomu, to Kabushiki Kaisha Toshiba Electrothermal printer with a resistive ink ribbon and differing resistance current return paths 5,005,993, Cl. 400-120.000

Ohshima, Minoru *See*—
Mochizuki, Takeshi, Katagiri, Shigenobu, Seino, Minoru, Ohshima, Minoru, Saito, Susumu, and Arimoto, Akira, 5,006,704, Cl. 250-235.000
Saito, Susumu, Arimoto, Akira, Mochizuki, Takeshi, Tsuji, Yasuyuki, Ohshima, Minoru, and Seino, Minoru, 5,006,705, Cl. 250-235.000

Ohshima, Shigeo, Toda, Haruki, and Ikawa, Tatsuo, to Kabushiki Kaisha Toshiba Multiport memory with improved timing of word line selection 5,007,028, Cl. 365-233.000

Ohshita, Koichi, to Nikon Corporation Keplerian zoom finder optical system 5,005,955, Cl. 350-423.000

Ohta, Katsuhiro, Masuda, Hisami, and Makishima, Mamoru, to TDK Corporation Tire abnormality detecting device 5,006,844, Cl. 340-448.000

Ohta, Masanori, to Isuzu Jidosha Kabushiki Kaisha Cylinder liner unit for use in an internal combustion engine 5,005,469, Cl. 92-169.400

Ohtake, Yasuhisa *See*—
Sagou, Seiji, and Ohtake, Yasuhisa, 5,006,432, Cl. 430-23.000

Ohtsubo, Yoshiaki *See*—
Kosaka, Toru, Ohtsubo, Yoshiaki, and Meguro, Hiroshi, 5,006,700, Cl. 250-201.400

Ohtsuka, Eiji, to Kabushiki Kaisha Toshiba Electronic exchange having a conference telephone communication function and conference telephone communication method 5,007,049, Cl. 370-62.000

Ohtsuka, Koji, and Goto, Hirokazu, to Sanken Electric Co., Ltd. Fabrication of P-N junction semiconductor device 5,006,483, Cl. 437-179.000

Oikawa, Tetsuo *See*—
Mori, Nobufumi, Ohnishi, Masahiro, Miyahara, Junji, Oikawa, Tetsuo, and Harada, Yoshiyasu, 5,006,707, Cl. 250-311.000

Oilar, Clayton D., to Oilar, Clayton Dale Insulated beverage cup 5,005,717, Cl. 215-13.100

Oilar, Clayton Dale *See*—
Oilar, Clayton D., 5,005,717, Cl. 215-13.100

Oishi, Kengo *See*—
Onmori, Shozo, Takahashi, Daisuke, and Oishi, Kengo, 5,006,947, Cl. 360-132.000

Oka, Kengo, to Sumitomo Rubber Industries, Ltd. Golf ball 5,005,838, Cl. 273-232.000

Oka, Yoshiyuki, to Sejima, Shiro; Oka, Yoshiyuki, and Murata, Ken Coagulant for soil and/or sand method for preventing washout using the same 5,006,176, Cl. 106-633.000

Okabe, Minoru *See*—
Kanamori, Iwao, and Okabe, Minoru, 5,005,957, Cl. 350-432.000

Okada, Hisashi, and Yagihara, Morio, to Fuji Photo Film Co., Ltd. Silver halide photographic material 5,006,444, Cl. 430-264.000

Okada, Hisashi *See*—
Yagihara, Morio, Okada, Hisashi, and Katoh, Kazunobu, 5,006,445, Cl. 430-264.000

Okadome, Kenichiro *See*—
Inokuchi, Kiyoshi, Okadome, Kenichiro, Muto, Yoichi, Kawai, Yoshio, Onuma, Tadashi, and Shirakami, Toshiharu, 5,006,111, Cl. 604-67.000

Okamoto, Hiroyuki, and Hoshino, Kunio, to Yazaki Corporation. Connector with built-in through capacitors 5,006,079, Cl. 439-607.000

Okamoto, Osamu, Nakaya, Teruomi, Suzuki, Seizo; Kuwano, Naoaki, Sakai, Yoshinori, Oda, Hiroshi, Uegusa, Masao, and Iba, Goji, to National Aerospace Laboratory of Science & Technology Agency, and Kawasaki Industries, Ltd. Docking and active damping device for space structures 5,005,786, Cl. 244-161.000

Okamoto, Teiichi *See*—
Tanaka, Hazime, Okamoto, Teiichi, Yoshiga, Kenji, and Watanabe, Kazuhiko, 5,005,370, Cl. 62-211.000

Okauchi, Shigeki, to Canon Kabushiki Kaisha. Magnetic recording and/or reproducing apparatus having a retaining mechanism for a disc-shaped magnetic record bearing medium 5,007,040, Cl. 369-270.000

Okazaki, Hiroshi *See*—
Kazaoka, Kenichi, and Okazaki, Hiroshi, 5,006,052, Cl. 418-61.100

Okazaki, Kiyoshi, to Kabushiki Kaisha Toshiba Destroying wave treatment apparatus. 5,005,580, Cl. 128-660.030

Okazaki, Masaki *See*—
Toya, Ichizo, Ohmura, Kunioki, and Okazaki, Masaki, 5,006,449, Cl. 430-508.000

Oki Electric Industry Inc. Co *See*—
Harada, Yusuke, 5,006,484, Cl. 437-192.000

Okimoto, Haruo *See*—

Kawakita, Kouji; Kimura, Suzushi, Orinaka, Hideyuki; Yokotani, Youichiro, and Ishikawa, Mariko, 5,006,956, Cl. 361-321.000.

Ormco Corporation *See*—
Pickrell, Floyd W., Jr., Reher, James F.; and Sterrett, Terry L., 5,005,730, Cl. 221-71.000

Ortega, Agustin P A *See*—
Sanchez, Florentina S., Susan, Victor R., Carramolino-Fitera, Laura; and Ortega, Agustin P. A., 5,006,471, Cl. 435-254.000.

Osada, Naomi *See*—
Takanashi, Itsuo, Tanaka, Hedeshi, Kato, Shigeru, Osada, Naomi; and Ichito, Toshikatsu, 5,005,998, Cl. 400-208.000

Osanai, Osamu *See*—
Kawai, Michio, Tanaka, Sadahiro; and Osanai, Osamu, 5,005,575, Cl. 356-237.000.

Oscar Mayer Foods Corporation *See*—
Hustad, Gerald O., and Griesbach, Ray H., 5,005,707, Cl. 206-632.000

Oshima, Junji; Fujii, Tatsuo, and Yamada, Minoru, to Takeda Chemical Industries, Ltd. Core-shell polymer, composition containing the polymers and its molded articles 5,006,592, Cl. 524-504.000

Oshima, Kazuo, and Iwasaki, Shizuo, to Bridgestone Corp. Pneumatic radial tire having a folded belt including a polyvinyl alcohol cords 5,005,626, Cl. 152-527.000.

Oshio, Minoru *See*—
Kishi, Hiroshi, Chazono, Hirokazu; Oshio, Minoru; Saito, Hiroshi; Nakamura, Toshiya; and Shizuno, Hisamitsu, 5,006,954, Cl. 361-321.000.
Kishi, Hiroshi, Chazono, Hirokazu, Oshio, Minoru; Saito, Hiroshi; Nakamura, Toshiya, and Shizuno, Hisamitsu, 5,006,955, Cl. 361-321.000

Oshiro, Yasuo; Sato, Seiji; and Kurahashi, Nobuyuki, to Otsuka Pharmaceutical Co., Ltd. Carbostyril derivatives. 5,006,528, Cl. 514-253.000

Osman, Bradley L *See*—
Rippingale, John B., Upton, Charles R.; Schonstedt, Erick O., Osman, Bradley L., and , 5,006,806, Cl. 324-326.000

Ostergaard, David A., to Cedarapids, Inc. Impeller bar installation and repositioning means for impact crushers having open type rotors 5,005,772, Cl. 241-30.000

Osterloff, Kurt *See*—
Furer, Gerd; Heinzelmann, Karl-Fritz, and Osterloff, Kurt, 5,005,437, Cl. 74-467.000

Ostrowski, Jorg *See*—
Schonafinger, Karl, Beyerle, Rudi, Just, Melitta, Bohn, Helmut, and Ostrowski, Jorg, 5,006,540, Cl. 514-361.000

Ota, Kazuo, to Kabushiki Kaisha Komatsu Seisakusho. Apparatus including a laser scanner 5,005,929, Cl. 350-6.500.

Otai Tekko Kabushiki Kaisha and Koyo Seiko Co., Ltd. *See*—
Yamamoto, Takeomi, Endo, Nariaki, Kadota, Yasushi; and Yamakawa, Tadasu, 5,005,541, Cl. 123-90.350.

Otis Elevator Company *See*—
Nakai, Keiichiro, and Nakanishi, Yoshinori, 5,005,672, Cl. 187-17.000
Rivera, James A., 5,005,673, Cl. 187-52.0LC.

Otsuka Pharmaceutical Co., Ltd. *See*—
Oshiro, Yasuo, Sato, Seiji; and Kurahashi, Nobuyuki, 5,006,528, Cl. 514-253.000.

Otsuki, Akira, to Alpine Electronics Inc. Reversible drive mechanism for a tape recording apparatus 5,006,941, Cl. 360-96.200

Ott, Donald E. Panel-framing assembly and assembly method therefor. 5,005,333, Cl. 52-476.000.

Ottenheimer, Charles J Liquid chilling apparatus. 5,005,378, Cl. 62-378.000.

Otuka, Soiti. *See*—
Arima, Yoshihiro; Otuka, Soiti, and Kazushige, Nishida, 5,006,376, Cl. 428-34.100.

Ouchi, Teruo *See*—
Takahashi, Nagashige, and Ouchi, Teruo, 5,005,755, Cl. 228-126.000.

Outboard Marine Corporation *See*—
Binversie, Gregory J., Macier, James E.; and Mate, David W., 5,005,535, Cl. 123-52.00M
Bland, Gerald F.; Mondek, Martin J.; and Zdanowicz, Lawrence E., 5,006,085, Cl. 440-75.000

Overheidt, Robert P., to Miner Enterprises, Inc. Railway hopper car sliding gate sealing mechanism. 5,005,490, Cl. 105-282.200.

Owen, Hartley *See*—
Herbst, Joseph A.; Owen, Hartley; and Schipper, Paul H., 5,006,497, Cl. 502-67.000

Owens-Corning Fiberglas Corporation *See*—
Hartman, David R., Jutte, Ralph B., Beaver, Terry R.; and Hill, Homer G., 5,006,293, Cl. 264-137.000

Oy Partek AB. *See*—
Laimio, Kai, 5,005,488, Cl. 105-148.000

Pacer, James M *See*—
Roehrs, Daniel C., Caruso, Angelo T., Grace, Robert E., Mara, Robert M.; Elliot, John G., Saraceno, Patricia J., and Pacer, James M., 5,006,892, Cl. 355-208.000

Pacesetter Infusion, Ltd *See*—
Garrison, Michi E., Pelmulder, John P., and Renger, Herman L., 5,006,110, Cl. 604-65.000

Paciullo, Francis P., to Colgate-Palmolive Company. Litter box liner. 5,006,379, Cl. 428-35.200

Packham, Jackie F Rag rug loom. 5,005,273, Cl. 28-149.000.

Paff, Aaron R., to Rockwell International Corporation. Third mode torsional F-M resonator. 5,006,824, Cl. 333-197.000.

Pagani, Giorgio: *See*—
Zardi, Umberto; and Pagani, Giorgio, 5,006,316, Cl. 422-148.000.

Page, Shona M.. *See*—
Michell, Ernest W. J.; and Page, Shona M., 5,006,174, Cl. 106-426.000.

Pagnier, Thierry: *See*—
Duclot, Michel J.; and Pagnier, Thierry, 5,006,430, Cl. 429-191.000

Painter, Corning F.: *See*—
Chen, Michael S. K.; Painter, Corning F.; Pastore, Steven P.; Roth, Gary; and Winchester, David C., 5,006,141, Cl. 65-27.000.

Paleologou, Michael; and Berry, Richard M., to Pulp and Paper Research Institute of Canada Electrodialytic water splitting process for the treatment of aqueous electrolytes. 5,006,211, Cl. 204-182.400.

Pall Corporation: *See*—
Cooper, Roydon B., 5,006,235, Cl. 210-136.000

Palm, Bernhard, to Milwaukee Electric Tool Corporation Insulated cooling boot for power tool. 5,006,740, Cl. 310-50.000.

Palmer, Gary E.: *See*—
McLeod, Rick; and Palmer, Gary E., 5,005,251, Cl. 15-327.100.

Palmer, Michael J.: *See*—
Bregman, Mark F.; Horton, Raymond R.; Noyan, Ismail C.; and Palmer, Michael J., 5,006,925, Cl. 357-82.000
Kang, Sung K.; Palmer, Michael J.; Reiley, Timothy C.; and Topa, Robert D., 5,006,917, Cl. 357-70.000

Palmgren, Sven; and Tedenstig, Ove, to Facit AB. Control circuit for point-generating units of a write head. 5,007,004, Cl. 364-519.000.

Panandiker, K. P *See*—
Danick, Charles, and Panandiker, K. P., 5,006,612, Cl. 525-438.000

Pandey, Sudhakar: *See*—
Miller, John C.; Pandey, Sudhakar, and Pollock, Earl M., 5,006,713, Cl. 250-361.00R.

Gupta, Pramod; Engels, Hans-Wilhelm; and Rabe, Hansjurgen, 5,006,599, Cl. 524-740.000.

Rademacher, Wilhelm *See—*
Seele, Rainer; Kober, Reiner; Karbach, Stefan, Sauter, Hubert; Ammermann, Eberhard, Lorenz, Gisela, Rademacher, Wilhelm, and Jung, Johann, 5,006,152, Cl. 71-92.000

Radiation Measurements, Inc.: *See—*
Attix, Frank H., 5,006,714, Cl. 250-368.000.

Radtke, Manfred; and Ueffinger, Friedrich, to Eastman Kodak Company. Sheet stacking and stapling apparatus. 5,005,751, Cl. 227-111.000

Raemer, Daniel B.; Walt, David R.; and Munkholm, Christianne, to Brigham & Women's Hospital. CO_2 indicator and the use thereof to evaluate placement of tracheal tubes. 5,005,572, Cl. 128-207.140.

Raggio, William A. *See—*
Woolf, Lawrence D., Elsner, Frederick H.; and Raggio, William A., 5,006,507, Cl. 505-1.000.

Raghavan, Krishnan K. *See—*
Wong, Mon-N., Patin, Robert J., Trese, Brennan J., and Raghavan, Krishnan K., 5,006,859, Cl. 343-700.0MS

Ragosch, Ernst P., and Schwarz, Henning, to U.S. Philips Corporation. Circuit arrangement for adjusting the amplitude of a signal. 5,006,727, Cl. 307-264.000

Rahkonen, Timo *See—*
Alasaarela, Esko; Adolfsen, Pekka, and Rahkonen, Timo, 5,007,091, Cl. 381-26.000

Rahrooh, Ghobad; and Engel, Rudiger A. Deaeration process for the manufacture of fruit juices. 5,006,354, Cl. 426-231.000.

Rai Radiotelevisione Italiana *See—*
Barbero, Marzio; Muratori, Mario; and Stroppiana, Mario, 5,006,929, Cl. 358-105.000

RAI Radiotelevisions Italiano, S.p.A. *See—*
Stroppiana, Mario; and Ronchetti, Luigi, 5,006,930, Cl. 358-133.000.

Raine, Peter D.; and Ophaug, Darrell P., to Square D Company. Self-sealing snap-in receptacle, especially for circuit breaker cover retention. 5,005,880, Cl. 292-17.000

Raju, Vish *See—*
MacMillan, Ian; and Raju, Vish, 5,007,080, Cl. 379-269.000.

Ramirez, Richard J *See—*
Lee, Roger W., and Ramirez, Richard J., 5,005,451, Cl. 81-487.000

Ramos, John S *See—*
Furbee, Avery D., Bauer, Carl F., and Ramos, John S., 5,007,074, Cl. 378-138.000

Ramsay, Richard P. Telescopic carrying case. 5,005,743, Cl. 224-202.000

Ramsey, Robert B *See—*
Stokke, Olaf M.; Flanigan, David A.; Ramsey, Robert B., Williams, Robert E., and Huycke, John, 5,005,655, Cl. 175-66.000

Rapin, Jacques, and Vaillant, Philippe, to Framatome. Device for the electrical induction heating of a fluid contained in a pipeline. 5,006,683, Cl. 219-10.510.

Rare Research *See—*
Bailey, Ronald F., 5,005,257, Cl. 452-185.000

Rausco, Anthony *See—*
Schwarz, Fred M., Crawley, Clifton J., Jr., Rausco, Anthony, and Lagueux, Ken R., 5,005,352, Cl. 60-39.020

Rautanen, Suorama *See—*
Salminen, Ari; and Rautanen, Suorama, 5,006,399, Cl. 428-224.000

Raytheon Company *See—*
Clawson, Lawrence G.; and Adamski, Joseph R., 5,005,383, Cl. 68-133.000
Szewczyk, Robert M., 5,005,480, Cl. 102-213.000.

Reams, William H., to United States of America, Navy. Combined mine safety deployment and activation system. 5,005,482, Cl. 102-420.000

Reasoner, George E., Jr *See—*
D'Aoust, Robert; Cording, Robert B.; Grosse, Debora Y.; Jennings, Kevin, Krebs, Stephen R. Reasoner, George E., Jr., Smith, Gerald R., and Williams, David C., 5,007,100, Cl. 382-49.000.

Reavley, Francis Coin count verifier. 5,006,091, Cl. 453-59.000

Rebel, Herbert, and Hummel, Peter, to MAN Roland Druckmaschinen AG. Attachment for a damping unit of an offset printing press. 5,005,474, Cl. 101-148.000

Recasens, Joseph *See—*
Zanoli, Alain P.B., and Recasens, Joseph, 5,005,635, Cl. 165-9.100

Rector, Steve G. *See—*
Spangler, James B.; and Rector, Steve G., 5,006,963, Cl. 361-417.000

Reddy, Prabhakara Hybrid RF coupling device with integrated capacitors and resistors. 5,006,822, Cl. 333-112.000.

Reebok International Ltd.. *See—*
Diaz, Juan A.; Goldston, Mark R.; White, Spencer; Miller, David E., Legassie, Charles P., Russell, Wayne, and Ringel, Judith C., 5,005,300, Cl. 36-114.000.

Reedom, Eddie R. Seat belt cushion in the form of people places and things. 5,005,866, Cl. 280-801.000.

Reemay, Inc *See—*
LaTondress, Nancy T.; and Thomas, H. E., 5,005,706, Cl. 206-595.000.

Rees, Fenton, to Sundstrand Corporation. Torque angle control system for controlling the torque angle of a permanent magnet synchronous motor. 5,006,774, Cl. 318-721.000

Rees, Richard W., to Du Pont de Nemours, E. I., and Company. Fluorinated thermoplastic elastomers containing polymeric additives and process for preparing such elastomers. 5,006,594, Cl. 524-520.000

Reeves, Richard L.; and Woodland, Dennis Bi-directional flexible seal. 5,005,634, Cl. 165-9.000.

Reher, James F. *See—*
Pickrell, Floyd W., Jr., Reher, James F.; and Sterrett, Terry L., 5,005,730, Cl. 221-71.000

Reich, Sanford, to Shiley Infusaid, Inc. Pump diagnostic system. 5,006,997, Cl. 364-510.000.

Reid, William W., and Young, Joseph L., to Reid, William W.; Young, Joseph L., and U.S. Gold Corporation. Microbiological oxidation process for recovering mineral values. 5,006,320, Cl. 423-150.000

Reik, Wolfgang, and Elison, Hans-Dieter, to Luk Lamellen und Kupplungsbau GmbH. Torque transmitting and torsion damping apparatus for use in motor vehicles. 5,005,686, Cl. 192-70.170

Reiley, Timothy C. *See—*
Kang, Sung K., Palmer, Michael J., Reiley, Timothy C., and Topa, Robert D., 5,006,917, Cl. 357-70.000

Reinartz, Hans-Dieter; Steffes, Helmut; Von Hayn, Holger; and Meier, Thomas, to Alfred Teves GmbH. Tandem master cylinder. 5,005,350, Cl. 60-562.000

Reliance Electric Industrial Company *See—*
Fischer, Michael J. and Wilson, W. Eugene, 5,006,007, Cl. 403-290.000

Relson, Morris *See—*
Turney, David L., and Relson, Morris, 5,005,305, Cl. 40-449.000

REM Technologies, Inc *See—*
Wintermute, Pamela D., 5,006,748, Cl. 310-258.000

Rembold, Helmut, Pflug, Hannes, Christ, Wilhelm, Siebert, Hans-Joachim, Eblen, Ewald, Rodriguez-Amaya, Laufer, Helmut, Schmitt, Alfred, Pape, Werner, Buisson, Dominique, Lauvin, Pierre, Potz, Detlev, Simon, Nikolaus, Pigeroulet, Jean, and Karle, Anton, to Robert Bosch GmbH. Fuel injection pump. 5,005,548, Cl. 123-450.000

Renard, Georges *See—*
Besson, Raymond, Delatte, Richard, Renard, Georges, Valentin, Jean-Pascal, and Vaterkowski, Jean-Louis, 5,006,750, Cl. 310-348.000

Renger, Herman L *See—*
Garrison, Michi E., Pelmulder, John P., and Renger, Herman L., 5,006,110, Cl. 604-65.000

Renishaw plc *See—*
Taylor, Benjamin R., Chapman, Mark A. V., and Graham, Jeffrey, 5,007,006, Cl. 364-571.050
Thomas, David K., 5,006,952, Cl. 361-283.000

Resch, Carol M., to Lever Brothers Company. Soap compositions of enhanced antimicrobial effectiveness. 5,006,529, Cl. 514-721.000

Research Corporation Technologies, Inc *See—*
Hall, Dennis G., 5,006,716, Cl. 250-458.100

Research & Education Institute, Inc. Harbor-UCLA Medical Center *See—*
Bustillo, Maria del Carmen, 5,005,583, Cl. 128-738.000

Retech, Inc. *See—*
Schlienger, Max P., 5,005,494, Cl. 110-341.000

Revus, David E., and Boyer, Russell E., to Chevron Research Company. Microwave oil saturation scanner. 5,006,785, Cl. 324-639.000

Rex, Donald K. *See—*
Paterra, Jeffrey H., and Rex, Donald K., 5,005,996, Cl. 400-196.100

Rheinheimer, Joachim, Eicken, Karl, Plath, Peter, Westphalen, Karl-Otto, and Wuerzer, Bruno. Pyridine derivatives and their use as herbicides. 5,006,155, Cl. 71-92.000

Rheinmetall GmbH *See—*
Witt, Wolfram, 5,005,484, Cl. 102-501.000

Rhodes, Richard D., Jr., and Fredericks, W. David, to Davidson Textron Inc. Molding method for stabilizing the location of a skin insert. 5,006,288, Cl. 264-46.600

Rhodes, Warren W. *See—*
O'Bryan, Henry M., Jr., Rhodes, Warren W., and Thomson, John, Jr., 5,006,504, Cl. 505-1.000

Rhone-Poulenc Chimie *See—*
Cailly, Francinet; Leveque, Alain, and Sabot, Jean-Louis, 5,006,254, Cl. 210-639.000
Demazeau, Gerard, Martel, Olivier, Devalette, Michel, and Verdon, Eric, 5,006,318, Cl. 423-21.100

Rhone-Poulenc Rorer Pharmaceuticals Inc *See—*
Newman, Jack, and Farb, David L., 5,006,642, Cl. 530-383.000

Rhone-Poulenc Sante *See—*
Coffee, Edward C. J., 5,006,546, Cl. 514-397.000.

Ribio, Manuel J., de la Vega, Alberto, and Mueller-Lobeck, Eberhard. Method of making tortillas. 5,006,358, Cl. 426-496.000

Ricco, Mario, Damiani, Vincenzo, and Picciallo, Michele, to Weber S.r.l. System for determining axial displacement of a rod, particularly the plunger of an electromagnetic fuel injector. 5,005,404, Cl. 73-119.00A

Richard Wolf GmbH: *See—*
Wurster, Helmut; and Krauss, Werner, 5,005,579, Cl. 120-660.030

Richards, David M. *See—*
Baarman, David W.; and Richards, David M., 5,006,849, Cl. 341-95.000

Richards, Judith M., and Beckman, James H., to Eastman Kodak Company. Envelope constructed for ink jet printing. 5,005,758, Cl. 229-68.00R

Richardson, Roy A *See—*
Materna, Richard H., Linse, John S., and Richardson, Roy A., 5,007,084, Cl. 380-24.000

Rothman, Bobby W. *See—*
Cocco, Eugene R.; and Rothman, Bobby W., 5,005,284, Cl. 29-884.000.

Rotolico, Anthony J.: *See—*
Dorfman, Mitchell F.; Kaufold, Roger W., Kushner, Burton, Rotolico, Anthon, J.; and Tilkaran, Roopnarine, 5,006,321, Cl. 427-192.000.

Rouse, Marshall J., to Westinghouse Electric Corp. Apparatus for accurately assembling large scale machine parts. 5,005,276, Cl. 29-244.000.

Rouse, Melvin R. Autoclavable dental burr holder. 5,006,066, Cl. 433-77.000.

Roussel Uclaf. *See—*
Moguilewsky, Martine; Nedelec, Lucien; Nique, Francois; and Philibert, Daniel, 5,006,518, Cl. 514-179.000.

Rousser, Robert. *See—*
Martin, Charles R., Rousser, Robert, and Brabec, Daniel L., 5,005,774, Cl. 241-101.200.

Rowe, Neal E. *See—*
Sloff, Michael E.; and Rowe, Neal E., 5,006,682, Cl. 200-429.000.

Rowlands, Ivor T. Nuclear power plant. 5,006,303, Cl. 376-282.000.

Rowlett, Don C.. *See—*
Beach, Wayner H.; Den Besten, Leroy E., and Rowlett, Don C., 5,005,622, Cl. 144-241.000.

Roy, Samir. *See—*
Cleary, Gary W., and Roy, Samir, 5,006,342, Cl. 424-445.000.

Rozek, Werner. *See—*
Beltz, Dietmar; Nehler, Hans-Juergen, and Rozek, Werner, 5,006,981, Cl. 364-200.000.

Rozendaal, Adrianus. *See—*
Van der Plank, Pleun; and Rozendaal, Adrianus, 5,006,648, Cl. 536-119.000.

Rozman, Gregory I., to Sundstrand Corporation. Synchronous motor control. 5,006,768, Cl. 318-254.000.

Rubin, Barry J. *See—*
Deutsch, Alina, and Rubin, Barry J., 5,006,918, Cl. 357-71.000.

Rubin, Bruce J.: *See—*
Baughman, Richard C.; Ellingham, David J., Fowlkes, William Y., Rubin, Bruce J., and Stepanik, Frank S., 5,006,900, Cl. 355-271.000.

Rubin, David. Method for increasing tumor sensitivity to chemotherapy. 5,005,588, Cl. 128-804.000.

Rubin, David; and Rubin, Elyiahu J., to Century Laboratories, Inc. Process for the production of a marine animal oil. 5,006,281, Cl. 260-424.000.

Rubin, Elyiahu J. *See—*
Rubin, David, and Rubin, Elyiahu J., 5,006,281, Cl. 260-424.000.

Rubino, Daniel A. *See—*
Dziedzic, Joseph H., Jr., Rubino, Daniel A., and Schaeffer, Raymond J., 5,006,019, Cl. 406-152.000.

Rubinstein, Mordechai. *See—*
Kedem, Dan, and Rubinstein, Mordechai, 5,005,347, Cl. 56-328.100.

Ruch, Mark H., Paulsel, Roger Q., and Naron, Patricia J., to Compaq Computer Corporation. Sheet feeding mechanism and method for an electrophotographic printer. 5,005,817, Cl. 271-9.000.

Rueffer, Manfred. *See—*
Schiel, Lothar, and Rueffer, Manfred, 5,005,918, Cl. 303-114.000.

Rumm, Mark. *See—*
Serikov, Vladimir; Rumm, Mark; and Staub, Norman C., 5,005,582, Cl. 128-691.000.

Rupprecht, Kathleen M. *See—*
Baker, Robert K.; Pessolano, Arsenio A.; Rupprecht, Kathleen M., and Durette, Philippe L., 5,006,532, Cl. 514-301.000.

Ruscev, Mario, and Vandenabeele, Patrick, to Schlumberger Technology Corporation. Method and apparatus for measuring subsidence. 5,005,422, Cl. 73-784.000.

Rush, Donald L., and May, Norman W., to AEG Westinghouse Transportation Systems, Inc. Train motion detection apparatus. 5,006,847, Cl. 340-994.000.

Russell, Patrise M. *See—*
Dennison, Kathleen A., Kolcinski, Bruce E., Krishnan, Subramanian, and Russell, Patrise M., 5,006,247, Cl. 210-500.380.

Russell, Wayne. *See—*
Diaz, Juan A., Goldston, Mark R., White, Spencer, Miller, David E., Legassie, Charles P., Russell, Wayne, and Ringel, Judith C., 5,005,300, Cl. 36-114.000.

Rutherford, David B., Jr., to General Signal Corp. Vital processor implemented with non-vital hardware. 5,007,018, Cl. 364-900.000.

Ryan, Kyle A., Ackerman, Michael, Hale, Bruce, and Payne, Ward, to Turning the Tables, Inc. Board game. 5,005,839, Cl. 273-240.000.

Ryan, Robert C.. *See—*
Smegal, John A., Bilgic, Haluk A., Ryan, Robert C., and Grieshop, Vance J., 5,006,224, Cl. 208-254.00H.

Sabot, Jean-Louis. *See—*
Cailly, Francinet, Leveque, Alain, and Sabot, Jean-Louis, 5,006,254, Cl. 210-639.000.

Sado, Chiharu, and Matsuda, Yasuhiko, to Yoshida Kogyo K.K. Method of controlling the operation of applying a succession of discrete coupling elements. 5,005,278, Cl. 29-408.000.

Sager, Edmund. *See—*
Aime, Michel, and Sager, Edmund, 5,005,671, Cl. 187-1.00R.

Sagiyama, Masaru: *See—*
Watanabe, Tsutomu, Sagiyama, Masaru; Kawabe, Masaki; and Morita, Masaya, 5,006,420, Cl. 428-629.000.

Sagou, Seiji; and Ohtake, Yasuhisa, to Kabushiki Kaisha Toshiba. Method for manufacturing a shadow mask. 5,006,432, Cl. 430-23.000.

Sahashi, Noboru. *See—*
Kawase, Hideyuki, Sahashi, Noboru; and Hashizume, Tamotsu, 5,006,143, Cl. 65-43.000.

Saifer, Mark; Somack, Ralph; and Williams, L. David, to DDI Pharmaceuticals, Inc. Conjugates of superoxide dismutase coupled to high molecular weight polyalkylene glycols. 5,006,333, Cl. 424-78.000.

Saint-Gobain Vitrage. *See—*
Mathivat, Denis, Colmon, Daniel, and Philibert, Daniel, 5,006,146, Cl. 65-273.000.

Saint Gobain-Vitrage International. *See—*
Sauvinet, Vincent, Fosset, Jean, Valere, Michel; Defort, Daniel, and Boutrouille, Maurice, 5,005,769, Cl. 239-429.000.

Saint-Louis Augustin, Guy, and Guillon, Henri, to Hutchinson. Bottom wiper seal for a retractable car window. 5,005,317, Cl. 49-495.000.

Saito, Atsushi. *See—*
Koizumi, Yutaka, Nozawa, Minoru, Mori, Toshihiro, and Saito, Atsushi, 5,006,867, Cl. 346-140.00R.

Saito, Hiroshi. *See—*
Kishi, Hiroshi; Chazono, Hirokazu, Oshio, Minoru; Saito, Hiroshi; Nakamura, Toshiya; and Shizuno, Hisamitsu, 5,006,954, Cl. 361-321.000.
Kishi, Hiroshi, Chazono, Hirokazu; Oshio, Minoru; Saito, Hiroshi, Nakamura, Toshiya, and Shizuno Hisamitsu, 5,006,955, Cl. 361-321.000.

Saito, Naohito. *See—*
Masuda, Tsuyoshi, Tomihari, Hiromiti; Muto, Masaki; and Saito, Naohito, 5,006,578, Cl. 524-128.000.

Saito, Seiji. *See—*
Nonoshita, Hiroshi, and Saito, Seiji, 5,006,937, Cl. 358-456.000.

Saito, Susumu, Arimoto, Akira, Mochizuki, Takeshi, Tsuji, Yasuyuki; Ohshima, Minoru, and Seino, Minoru, to Hitachi, Ltd.; and Hitachi Koki Co., Ltd. Light beam scanning apparatus with controller for varying spacing between a plurality of scanning beams. 5,006,705, Cl. 250-235.000.

Saito, Susumu. *See—*
Mochizuki, Takeshi, Katagiri, Shigenobu, Seino, Minoru, Ohshima, Minoru, Saito, Susumu, and Arimoto, Akira, 5,006,704, Cl. 250-235.000.

Saito, Takeshi. *See—*
Mizuno, Toshiya, Teramoto, Yoshikichi, Saito, Takeshi, and Wakabayashi, Juichi, 5,006,695, Cl. 525-189.000.

Sakaguchi, Michiaki. *See—*
Kumagai, Motoo, Kato, Keiichi, Takeuti, Humio, Nagano, Masato; and Sakaguchi, Michiaki, 5,006,957, Cl. 361-321.000.

Sakaguchi, Nobuya, to Hosiden Electronics Co., Ltd. Jack with a switch. 5,006,675, Cl. 200-51.090.

Sakai, Akiyoshi. *See—*
Yonezawa, Yasuo, Ohnishi, Toshiya, Okumura, Shin'ichi, Sakai, Akiyoshi, Nakano, Hiroki, Matsushita, Masao, Morikawa, Atsushi and Yoshihara, Motoshi, 5,005,371, Cl. 62-238.600.

Sakai, Minoru. *See—*
Takahashi, Osamu, Sakai, Minoru, Furusawa, Genichi, and Hirano, Tsumoru, 5,006,453, Cl. 430-546.000.

Sakai, Nobuo. *See—*
Ishikawa, Takatoshi, Umemoto, Makoto, Sakai, Nobuo, and Furusawa, Genichi, 5,006,438, Cl. 430-372.000.

Sakai, Yoshinori. *See—*
Okamoto, Osamu, Nakaya, Teruomi, Suzuki, Seizo, Kuwano, Naoaki, Sakai, Yoshinori, Oda, Hiroshi, Uegusa, Masao, and Iba, Goji, 5,005,786, Cl. 244-161.000.

Sakakibara, Shiro, Imai, Norio, Kondo, Hidehiro, and Kamiya, Kazuo, to Aisin AW Co., Ltd. Control system for stepless belt transmissions. 5,005,442, Cl. 74-866.000.

Sakama, Masao. *See—*
Suzuki, Hideo, Matsushima, Shunichi, Obata, Masahiko, Sakama, Masao, Nakada, Akira, and Kumano, Shinji, 5,005,460, Cl. 84-600.000.

Sakamoto, Ichiro. *See—*
Itaba, Yasushi, Yoshifuji, Yutaka, Kondo, Takayoshi, Izawa, Minoru, Sakamoto, Ichiro, and Yoshino, Tadao, 5,006,378, Cl. 428-34.900.

Sakamoto, Keiji, and Kuwano, Hironobu, to Fanuc Ltd. Servomotor velocity control apparatus. 5,006,770, Cl. 318-561.000.

Sakamoto, Seiji, Kawaguchi, Chikakazu, Meguro, Yoshio, Harada, Takashi, and Takisawa, Toshifumi, to Diafoil Company, Limited. Polyester film for magnetic recording media. 5,006,589, Cl. 524-430.000.

Sakamoto, Yukio, and Yoshio, Hanato, to Murata Manufacturing Co., Ltd. Ceramic molded body. 5,006,392, Cl. 428-137.000.

Sakane, Chitose. *See—*
Takiguchi, Haruhisa, Kudo, Hiroaki, Sakane, Chitose, and Sugahara, Satoshi, 5,007,107, Cl. 372-96.000.

Sakashita, Takeshi. *See—*
Atsuta, Mitsuru, Sakashita, Takeshi, Miyamoto, Ryoichi, Tanimura, Yukinori, and Fuji, Saburo, 5,006,340, Cl. 424-405.000.

Sakemoto, Akito, Watanabe, Hitoshi, and Kanazawa, Yasunori, to Hitachi Maxell, Ltd. Optical information recording/reproducing apparatus. 5,007,039, Cl. 369-116.000.

Sakuma, Nobuo. *See—*
Suzuki, Seizo; Sakuma, Nobuo; Yamaguchi, Katsumi; and Endo, Osamu, 5,005,928, Cl. 350-6.100.

Sakurai, Masaaki; and Yoda, Mitsuru, to Nippon Signal Co., Ltd. The Visual magnetic recording medium and method of making the same. 5,006,422, Cl. 428-694.000.

Salminen, Ari; and Rautanen, Suorama, to Tamfelt OY AB. Planar textile structure. 5,006,399, Cl. 428-224.000.

Salomon S. A.: *See—*
Mabboux, Michel, 5,005,301, Cl. 36-117.000.

Salomon S.A.: *See—*
Bonaventure, Laurent; Begey, Jean-Marie, Perrissoud, Claude; and Lagier, Serge, 5,005,303, Cl. 36-120.000.
Szafranski, Pierre, 5,005,854, Cl. 280-626.000.

SAM Technology, Inc.: *See—*
Greer, Douglas S., and Gevins, Alan S., 5,005,578, Cl. 128-653.00A.

Samejima, Hisashi: *See—*
Hakoda, Keizo, and Samejima, Hisashi, 5,006,059, Cl. 425-573.000.

Samezawa, Mitsuo: *See—*
Hijikata, Isamu, Uehara, Akira; and Samezawa, Mitsuo, 5,006,220, Cl. 204-298.330.

Samsung Electronics Co., Ltd.. *See—*
Hwang, Sang K., Jung, Tae S., and Choi, Kyu H., 5,007,025, Cl. 365-226.000.
Kim, Byeongyun; and Hwang, Sangki, 5,007,023, Cl. 365-203.000.

Samuel, Ifor D. W. *See—*
Clark, Michael G., and Samuel, Ifor D. W., 5,005,952, Cl. 350-335.000.

Sanchez, Florentina S.; Susan, Victor R., Carramolino-Futera, Laura, and Ortega, Agustin P. A., to Antibioticos S.A. of Bravo Murillo 38. Fungal resistance markers. 5,006,471, Cl. 435-254.000.

Sanden Corporation. *See—*
Ishii, Yutaka, 5,005,285, Cl. 29-890.043.

Sanders, Douglas E., Uhler, George M., and Brown, John F., III, to Digital Equipment Corporation. Pipelined digital CPU with deadlock resolution. 5,006,980, Cl. 364-200.000.

Sandoz Ltd.: *See—*
Lee, Shy-Fuh, Anderson, Richard J., Luehr, Gary W., and Scott, Carole R., 5,006,150, Cl. 71-88.000.
Lehr, Friedrich, 5,006,644, Cl. 534-625.000.
Pedrazzi, Reinhard, 5,006,128, Cl. 8-437.000.

Sandvik AB. *See—*
Karlsson, Harry L., 5,005,989, Cl. 384-94.000.

Sandvik, Lars V., and Anderzen, Gert A., to General Engineering (Netherlands) B. V. Pivotally mounted locking station for passive safety belt carriage. 5,005,867, Cl. 280-804.000.

Sanjurjo, Angel, to CommTech Development Partners II. Process for producing crystalline silicon ingot in a fluidized bed reactor. 5,006,317, Cl. 422-245.000.

Sanken Electric Co., Ltd.. *See—*
Ohtsuka, Koji, and Goto, Hirokazu, 5,006,483, Cl. 437-179.000.

Sanki System Product Co., Ltd.. *See—*
Yukishita, Takeshi, 5,006,245, Cl. 210-256.000.

Sans, Claude. *See—*
Falempin, Francois, Sans, Claude, Champigny, Patrick, Laruelle, Gerard, and Garrel, Jean-Marie, 5,005,782, Cl. 244-53.00B.

Kumar, Lon D.; and Schobel, Alexander M., 5,006,571, Cl 523-120.000

Schock, Edward J. Connection of T sections between half rings within annular housing. 5,006,860, Cl 343-742.000

Schoenmakers, Albert W *See—*
Davis, Paul J., Quarmby, Simon C.; and Schoenmakers, Albert W., 5,006,341, Cl. 424-442.000

Schonafinger, Karl; Beyerle, Rudi; Just, Melitta, Bohn, Helmut; and Ostrowski, Jorg, to Cassella Aktiengesellschaft. Substituted 3-aminosydnonimines, processes for their preparation and their use 5,006,540, Cl 514-361.000.

Schonfeld, Frederick A. *See—*
Vines, Arthur D.; Schonfeld, Frederick A., and Espat, Ricardo, 5,006,841, Cl 340-825.070.

Schonstedt, Erick O. *See—*
Rippingale, John B., Upton, Charles R., Schonstedt, Erick O.; Osman, Bradley L; and , 5,006,806, Cl. 324-326.000

Schonstedt Instrument Company *See—*
Rippingale, John B, Upton, Charles R; Schonstedt, Erick O; Osman, Bradley L, and , 5,006,806, Cl. 324-326.000.

Schorlemmer, Hans U *See—*
Schwab, Wilfried, Bartlett, Robert R., Gebert, Ulrich; Schorlemmer, Hans U., Dickneite, Gerhard, and Sedlacek, Hans H., 5,006,515, Cl. 514-89.000

Schorr, Theodore H., to Spectra-Physics, Inc. Window seal for optical scanner 5,005,329, Cl 52-204.000.

Schott, Edmund A., to Sundstrand Corporation Brushless generator with concentrically arranged rectifier assembly 5,006,741, Cl 310-68.00D.

Schotter, Daniel K, to Hughes Aircraft Company. Multi-directional payout fiber optic canister 5,005,930, Cl. 350-96.100

Schram, Cornelius J, to National Research Development Corporation Manipulating means utilizing ultrasonic wave energy for use with particulate material 5,006,266, Cl 210-748.000.

Schroeder, Richard B., to Hercules, Incorporated. Double truck printing registration system for a rotary printing press 5,005,477, Cl 101-415.100.

Schubert, Frederic E. *See—*
DiSanto, Frank J., Krusos, Denis A.; and Schubert, Frederic E., 5,006,212, Cl 204-192.140

Schubert & Salzer Maschinenfabrik Aktiengesellschaft: *See—*
Schwarz, Ralph, 5,005,776, Cl 242-18.0PW

Schucker, Douglas W, to Motorola, Inc Direct contact TAB method 5,006,486, Cl 437-220.000

Schuetz, James E., to Dow Chemical Company, The Novel ceramic binder comprising poly(ethyloxazoline) 5,006,493, Cl. 501-127.000.

Schuetz, Stanley T. *See—*
Weidner, Jerry R.; Schuetz, Stanley T.; and O'Brien, Michael H., 5,006,142, Cl 65-32.500

Schuetzenduebel, Wolfram G, and Honan, James T., to Blount Energy Resource Corp. Controlling pollutants from boilers. 5,006,322, Cl. 423-210.000.

Schuiteman, Martin W *See—*
Eggink, Hendrik H J., Friedrichs, Winand H. A. M., Netten, Adriaan, Van Der AA, Herman H M., and Schuiteman, Martin W, 5,006,752, Cl 313-161.000

Schulte, Harvey; and Noto, Sal, to Becton, Dickinson and Company Apparatus for method for causing vortices in a test tube 5,005,981, Cl 366-219.000

Schulte, Richard D. *See—*
Borst, Herbert A., Machacek, Zdenek, Schnittger, Ernest; Schulte, Richard D., Scott, Richmond, and Tilman, Paul A., 5,005,275, Cl 29-235.000

Schultz, Mark H, and Koenig, David J., to Onan Corporation Microprocessor based integrated generator set controller apparatus and method 5,006,781, Cl 322-25.000

Schutte, Marlin *See—*
Markle, Stephen, Hutchings, William; Schutte, Marlin; and Howk, Richard, 5,005,843, Cl 279-29.000

Schutte, Marlin D, Bahr, Craig B, Weetman, Ronald J; and Howk, Richard A., to General Signal Corporation Mixing system for dispersing a compressible fluid such as gas into liquid in a vessel. 5,006,283, Cl 261-93.000

Schwab, Wilfried, Bartlett, Robert R, Gebert, Ulrich, Schorlemmer, Hans U; Dickneite, Gerhard, and Sedlacek, Hans H., to Hoechst Aktiengesellschaft Pharmaceuticals, phosphorus-containing 2-isoxazolines and isoxazoles contained therein 5,006,515, Cl. 514-89.000

Schwartz, Cheryl D. *See—*
Lam, Yiu-kuen T., Hensens, Otto D., Chang, Raymond S., Schwartz, Cheryl D., and Zink, Deborah L., 5,006,466, Cl. 435-120.000.

Schwartz, David S. Bingo game with indicia distributed on videocassette. 5,005,840, Cl. 273-269.000.

Schwarz, Fred M.; Crawley, Clifton J., Jr; Rausco, Anthony; and Lagueux, Ken R., to United Technologies Corporation Clearance control method for gas turbine engine 5,005,352, Cl. 60-39.020

Schwarz, Henning: *See—*
Ragosch, Ernst P.; and Schwarz, Henning, 5,006,727, Cl 307-264.000.

Schwarz, Ralph, to Schubert & Salzer Maschinenfabrik Aktiengesellschaft. Process and device to guide and sever a thread upon bobbin replacement. 5,005,776, Cl. 242-18.0PW

Schwarz, William M.; Marchessault, Robert H, Alexandru, Lupu; and Henrissat, Bernard, to Xerox Corporation. Hot melt ink compositions. 5,006,170, Cl. 106-20.000.

Schwenger, Willy, to Carl Stahl GmbH. Lifting clamp 5,005,890, Cl 294-103.100

Science Applications International Corporation *See—*
Gozani, Tsahi, and Shea, Patrick M., 5,006,299, Cl 376-159.000

Scimat Limited: *See—*
Cook, John A; and Singleton, Raymond W, 5,006,187, Cl 156-244.110.

Scimone, Anthony: *See—*
Klemann, Lawrence P., Finley, John W, and Scimone, Anthony, 5,006,351, Cl 426-611.000

Scipar, Inc.: *See—*
Singh, Surjit, 5,005,355, Cl 60-204.000

Scott, Carole R. *See—*
Lee, Shy-Fuh, Anderson, Richard J; Luehr, Gary W., and Scott, Carole R, 5,006,150, Cl. 71-88.000

Scott, Dana L. *See—*
Dooley, R. Dennis; Morris, Daryl W, Scott, Dana L; and Watts, Jimmy A., 5,005,245, Cl 15-104.040

Scott, Randy W., and Baker, Joffre B., to Invitron; and University of Kansas. Purified protease nexin 5,006,252, Cl 210-635.000

Scott, Richmond: *See—*
Borst, Herbert A., Machacek, Zdenek; Schnittger, Ernest; Schulte, Richard D., Scott, Richmond, and Tilman, Paul A, 5,005,275, Cl 29-235.000.

Scott, Sherman A. Undersea relocation apparatus & method 5,007,029, Cl 367-4.000.

Scott, Steven E., to Telectronics N.V. Braid Electrode leads and catheters and methods for using the same 5,005,587, Cl 128-786.000.

Scott, William L. *See—*
Cullinan, George J.; Laguzza, Bennett C, and Scott, William L, 5,006,652, Cl. 540-478.000

SDS Biotech Kabushiki Kaisha. *See—*

Shibazaki, Mitsuhiro *See*—
Yoshida, Hiroshi, Shibazaki, Mitsuhiro, Kubo, Hiroaki, and Jinbo, Shunji, 5,006,017, Cl. 405-263.000
Shih, T Thomas, and Sim, William J, to Arco Chemical Technology, Inc Propylene oxide purification. 5,006,206, Cl. 203-55.000
Shi, Hikaru, and Sugimoto, Fumio, to Furukawa Electric Co., Ltd., The Manufacturing uniaxially drawn oriented polyolefin film for electric insulation. 5,006,292, Cl. 264-127.000.
Shiki, Zenya *See*—
Fukuda, Makoto, Kashiwadate, Ken, Kouyama, Toshitaka, and Shiki, Zenya, 5,006,591, Cl. 524-502.000
Shikatani, Yutaka, Kataoka, Naoki, Shimo, Yoshiyuki, Kuroda, Nobuyuki, and Matsuura, Kazuo, to Nippon Oil Company, Limited Novel compolymers and electroactive polymers derived therefrom 5,006,633, Cl. 528-230.000
Shikunami, Juichi, Itonaga, Makoto, Kayanuma, Kanji, Kai, Masakatsu, and Nakamura, Nobuaki, to Victor Company of Japan, Ltd Reflective optical rotary encoder disc 5,006,703, Cl. 250-231.130
Shiley Infusaid, Inc *See*—
Reich, Sanford, 5,006,997, Cl. 364-510.000.

Shillington, Richard A., to Med-Safe Systems, Inc. Pole clip needle cap holder 5,005,793, Cl. 248-229.000.
Shillington, Ronald G., to Siemens-Bendix Automotive Electronics Limited. Integrated tuned induction system. 5,005,532, Cl. 123-52.00M
Shimamoto, Masayoshi *See*—
Nakane, Kazuhiko, Furukawa, Teruo, Shimamoto, Masayoshi, and Yoshimoto, Kyosuke, 5,007,038, Cl. 369-44.110
Shimazu, Isao *See*—
Miyagi, Junichi; and Shimazu, Isao, 5,005,411, Cl. 74-473.00R.
Shimazu, Nobuo *See*—
Yoshizawa, Masahiro, Kikuchi, Akira; Wada, Kou; Fujinami, Minpei; and Shimazu, Nobuo, 5,006,795, Cl. 324-158.00R.
Shimizu, Hiroshi *See*—
Maekawa, Masashi, Kotani, Kunio, Ukaji, Ryoji; Shimizu, Hiroshi; and Sato, Kenichi, 5,005,797, Cl. 248-479.000
Shimizu, Yoichi, to Nankai Kogyo Kabushiki Kaisha. Heald frame for looms 5,005,607, Cl. 139-91.000.
Shimo, Yoshiyuki *See*—
Shikatani, Yutaka, Kataoka, Naoki; Shimo, Yoshiyuki, Kuroda, Nobuyuki; and Matsuura, Kazuo, 5,006,633, Cl. 528-230.000.
Shimoda, Tatsuya; Seto, Takeshi, Endo, Kenichi, Yamaha, Yoshikazu; and Takagi, Nobukazu, to Seiko Epson Corporation, and Diesel Kiki Co., Ltd Scroll compressor with reverse rotation speed limiter 5,006,045, Cl. 417-42.000
Shimoi, Hiroyuki, to Fujitsu Limited Data protection system in a data processing system 5,007,027, Cl 365-229.000
Shimozono, Shigeru, to Seikosha Co., Ltd. Operation indicator of timepiece and so on 5,007,034, Cl. 368-77.000
Shimuzu, Akira, to Canon Kabushiki Kaisha Non-linear optical device. 5,005,933, Cl 350-96.140
Shin-Etsu Chemical Co., Ltd. *See*—
Itoh, Kunio, Shiobara, Toshio, and Futatsumori, Koji, 5,006,614, Cl 525-476.000
Watanabe, Junichi, and Yokota, Tohru, 5,006,623, Cl. 526-320.000.
Shin-Etsu Handotai Co., Ltd *See*—
Nakano, Masami, and Abe, Takao, 5,007,071, Cl 378-74.000.
Shin Etsu Polymer Co., Ltd *See*—
Egawa, Toshihiko; and Odashima, Satoshi, 5,005,949, Cl 350-276.00R
Shincovich, John T *See*—
Robinson, Darrell, and Shincovich, John T., 5,006,076, Cl 439-146.000
Shinonaga, Hirohiko *See*—
Takanashi, Itsuo, Nakagaki, Shintaro, and Shinonaga, Hirohiko, 5,006,935, Cl 358-300.000
Shinto, Hiroaki *See*—
Mori, Shinji, Buma, Kozi, and Shinto, Hiroaki, 5,005,860, Cl 280-731.000
Shiobara, Toshio *See*—
Itoh, Kunio, Shiobara, Toshio, and Futatsumori, Koji, 5,006,614, Cl 525-476.000
Shirakami, Toshiharu *See*—
Inokuchi, Kiyoshi, Okadome, Kenichiro, Muto, Yoichi, Kawai, Yoshio, Onuma, Tadashi, and Shirakami, Toshiharu, 5,006,111, Cl 604-67.000.
Shirato, Yoshiaki *See*—
Ayata, Naoki, Shirato, Yoshiaki, Takatori, Yasushi, and Seki, Mitsuaki, 5,006,864, Cl. 346-33.00R
Shirosaka, Toshiaki, to DX Antenna Company, Limited. Microstrip line antenna with crank-shaped elements and resonant waveguide elements 5,006,858, Cl 343-700.000
Shirota, Norihisa, to Sony Corporation Highly efficient coding apparatus 5,006,931, Cl. 358-133.000
Shirtum, Robert P., to Dow Chemical Company, The Removing contaminants from a gas stream. 5,006,369, Cl 427-212.000.
Shizuno, Hisamitsu *See*—
Kishi, Hiroshi, Chazono, Hirokazu, Oshio, Minoru, Saito, Hiroshi, Nakamura, Toshiya, and Shizuno, Hisamitsu, 5,006,954, Cl 361-321.000.
Kishi, Hiroshi, Chazono, Hirokazu, Oshio, Minoru, Saito, Hiroshi, Nakamura, Toshiya, and Shizuno, Hisamitsu, 5,006,955, Cl 361-321.000.
Shogaki, Takeshi *See*—
Kato, Yoshiko, Yoshinaga, Junji; Shogaki, Takeshi; Kurano, Satoko, and Yano, Ikuya, 5,006,514, Cl. 514-53.000.
Shoger, Kirk D *See*—
Heisley, Grover C.; Tegeler, John J., and Shoger, Kirk D., 5,006,531, Cl. 514-278.000
Short, Edward H, III; and Ellis, Jim E., to BS&B Safety Systems, Inc Fail safe rupture disk assembly 5,005,722, Cl. 220-89.100
Shuey, Lyle W., DeHoff, Edward J. and Schenk, Donald E., to General Motors Corporation ABS solenoid/isolation valve integration into single-ended solenoid body, using master cylinder actuation 5,005,919, Cl. 303-119.000
Sibilo, Gerard, and Louis, Michel, to Aerospatiale Societe Nationale Industrielle. Device for fixing an optical member such as a filter to a support. 5,005,947, Cl. 350-252.000.
Sichmann, Eggo, Krug, Thomas, and Kempf, Stephan, to Leybold Aktiengesellschaft. Process for coating a substrate with electrically conductive materials. 5,006,213, Cl. 204-192.140
Sidoruk, Sergei N. *See*—
Matjukhina, Ljudmila I., Mikhalev, Alexandr S.; Sidoruk, Sergei N., and Chushenkov, Igor M., 5,006,776, Cl 318-723.000.
Siebert, Hans-Joachim *See*—
Rembold, Helmut; Pflug, Hannes, Christ, Wilhelm; Siebert, Hans-Joachim; Eblen, Ewald, Rodriguez-Amaya, Laufer, Helmut, Schmitt, Alfred; Pape, Werner, Buisson, Dominique, Lauvin, Pierre; Potz, Detlev, Simon, Nikolaus; Pigeroulet, Jean, and Karle, Anton, 5,005,548, Cl. 123-450.000.
Siebol, George. Dual-lock blind fastener. 5,006,024, Cl 411-43.000.
Siemens Ak *See*—
Ebersole, Ronald J., Johnson, David; Budde, David, Myers, Mark S.; and Bier, Gerhard, 5,006,982, Cl 364-200.000.
Siemens Aktiengesellschaft: *See*—
Bachel, Ernst; and Licker, Anton-Guenther, 5,006,669, Cl. 174-93.000
Bransky, Olaf, Wiede, Guenter, Stein, Fritz-Dieter, and Helmreich, Gerhard, 5,007,090, Cl 381-60.000.
Dederer, Guenter, 5,005,455, Cl 83-50.000
Hamann, Jens; and Vogt, Hartmut, 5,006,775, Cl 318-723.000
Ingwersen, Hartwig, 5,006,805, Cl. 324-322.000
Lebisch, Helmut; Basel, Rainer, Fuchs, Georg, Dietmar, Hermann, Wipfelder, Ernst, and Hekele, Wilhelm, 5,006,055, Cl 425-2.000
Pernpeintner, Alfons; and Frinzel, Udo, 5,005,549, Cl 123-479.000
Schiteenhelm, Rudolf, 5,006,709, Cl 250-327.200.
Siemens-Bendix Automotive Electronics, L P *See*—
Yang, Kuang L., Gutierrez, David, and Gimpelson, George E., 5,006,421, Cl 428-641.000
Siemens-Bendix Automotive Electronics Limited *See*—
Shillington, Ronald G., 5,005,532, Cl 123-52.00M
Siemens Medical Laboratories, Inc *See*—

Silicon Systems, Inc.: *See*—
White, Bert, and Negabhan-Hagh, Mehrdad, 5,006,854, Cl 341-172.000.
Sillett, Christopher, to APV UK Limited Aseptic processing system 5,005,472, Cl 99-468.000.
Silver, Steven A *See*—
Phillips, Roger W.; Spellman, Vernon C., Gossett, Wayne L., Kamerling, Marc A., Coombs, Paul G., Todd, David W., and Silver, Steven A., 5,005,719, Cl 215-230.000.
Silvetti, Brian M. *See*—
MacCracken, Calvin D.; and Silvetti, Brian M., 5,005,368, Cl 62-139.000
Sim, Jae K Toilet assembly 5,005,222, Cl 4-216.000.
Sim, William J *See*—
Shih, T. Thomas; and Sim, William J., 5,006,206, Cl 203-55.000
Simm, Wolfgang, Steine, Hans-Theo, and Streb, Karl P., to Castolin S.A Apparatus for flame spraying of powder materials 5,005,764, Cl 239-79.000
Simon Container Machinery Limited: *See*—
Park, Marcus G., 5,006,042, Cl 414-795.400
Simon, Marvin K., and Divsalar, Dariush, to United States of America, National Aeronautics and Space Administration Doppler-corrected differential detection system 5,007,068, Cl 375-53.000.
Simon, Nikolaus *See*—
Rembold, Helmut; Pflug, Hannes; Christ, Wilhelm; Siebert, Hans-Joachim; Eblen, Ewald, Rodriguez-Amaya, Laufer, Helmut, Schmitt, Alfred; Pape, Werner, Buisson, Dominique; Lauvin, Pierre; Potz, Detlev, Simon, Nikolaus, Pigeroulet, Jean; and Karle, Anton, 5,005,548, Cl 123-450.000
Simpson, Harold G., and Bindra, Charanjit S., to Harold Simpson, Inc. Apparatus for securing a roofing support spacer to underlying support structures. 5,005,323, Cl. 52-90.000.
Singh, Balwant: *See*—
Forgione, Peter S., and Singh, Balwant, 5,006,653, Cl 544-196.000.
Singh, Surjit, to Scipar, Inc. Method of suppressing formation of contrails and solution therefor 5,005,355, Cl 60-204.000.
Singleton, Raymond W *See*—
Cook, John A., and Singleton, Raymond W., 5,006,187, Cl 156-244.110.
Sioux Tools, Inc *See*—
Young, Raymond L., and Sjovall, James A., 5,005,682, Cl 192-0.034
Sisk, Harold R.: *See*—
Draffen, Dale, Dunning, William E., McGregor, Larry D., Walker, Donald L., and Sisk, Harold R., 5,005,983, Cl 366-340.000
Siu-Ming, Yee. Acne solution. 5,006,557, Cl 514-557.000.
Sivan, Richard D., to Motorola, Inc Transistor device with high density contacts 5,006,911, Cl 357-23.110
Sjogren, Christer A., to Quipp, Incorporated Connection assembly for transmitting the load of an intercept arm directly to the pitch centerline of the drive chain. 5,006,041, Cl 414-790.400.
Sjovall, James A *See*—
Young, Raymond L.; and Sjovall, James A., 5,005,682, Cl 192-0.034.
Skerik, Richard D., to Du Pont de Nemours and Company Process control system with reconfigurable expert rules and control modules 5,006,992, Cl. 364-513.000.
Skerbinjek, Wolfgang *See*—
Bischof, Horst, and Skerbinjek, Wolfgang, 5,005,302, Cl. 36-119.000.
Skertic, Matthew M., to Hughes Aircraft Company Peltier cooling stage utilizing a superconductor-semiconductor junction 5,006,505, Cl. 505-1.000.

Skidmore, Ian F.; Lunts, Lawrence H. C.; Finch, Harry; Naylor, Alan; and Campbell, Ian B., to Glaxo Group Limited. Dichloroaniline derivatives for the therapy or prophylaxysis of a disease associated with reversible airway obstruction. 5,006,556, Cl. 514-539.000

Skunes, Timothy A., Case, Steven K.; and Jalkio, Jeffrey A., to CyberOptics Corporation. Apparatus and method for the noncontact measurement of drill diameter, runout, and tip position. 5,005,978, Cl. 356-372.000.

Slegers, John, to Rohm and Haas Company. Method of operating membrane separation systems. 5,006,253, Cl. 210-636.000.

Sloan-Kettering Institute for Cancer Research: *See*—
Yamaguchi, Hiroshi; Furukawa, Koichi, Livingston, Philip O.; Lloyd, Kenneth O.; Oettgen, Herbert F.; Old, Lloyd J., and Fortunato, Sheila R., 5,006,470, Cl. 424-85.800.

Sloff, Michael E.; and Rowe, Neal E., to Westinghouse Electric Corp. Linear snap action operating mechanism and an electrical switch incorporating same. 5,006,682, Cl. 200-429.000.

Smallfoot, Lambert L. Locking spout closure cap. 5,005,723, Cl. 220-210.000.

Smegal, John A.; Bilgic, Haluk A., Ryan, Robert C., and Grieshop, Vance J., to Shell Oil Company. Start-up of a hydrorefining process. 5,006,224, Cl. 208-254.00H.

Smith, Allan F.: *See*—
Shepley, Pete; Johnston, Richard; and Smith, Allan F., 5,005,554, Cl. 124-24.100.

Smith, Colin; and Welbourn, Anthony D., to British Telecommunications public limited company. Heterojunction bipolar transistor with SiGe. 5,006,912, Cl. 357-34.000.

Smith, Fred P.: *See*—
Smith, Fred T.; and Smith, Fred P., 5,006,030, Cl. 414-406.000.

Smith, Fred T.; and Smith, Fred P., to Waste Management of North America, Inc. Apparatus for transferring refuse from containers into refuse equipment. 5,006,030, Cl. 414-406.000.

Smith, Gerald R.: *See*—
D'Aoust, Robert; Cording, Robert B.; Grosse, Debora Y., Jennings, Kevin; Krebs, Stephen R., Reasoner, George E., Jr.; Smith, Gerald R.; and Williams, David C., 5,007,100, Cl. 382-49.000.

Smith, James C. Flat garment hanger with retainer slots. 5,005,742, Cl. 223-87.000.

Smith, James L.: *See*—
Prueitt, Melvin L., Mueller, Fred M., and Smith, James L., 5,006,672, Cl. 174-125.100.

Smith, John C., and Jacobson, William O., to Union Oil Company of California. Multiple fracture production device and method. 5,005,649, Cl. 166-308.000.

Smith, John W., and Meagher, James P., to Emhart Industries Inc. Automobile brake vacuum switch. 5,006,677, Cl. 200-61.890.

Smith, Jon D., to Dry Dock Industries, Inc. Fastener receiving cap. 5,006,027, Cl. 411-522.000.

Smith Kline & French Laboratories Ltd.: *See*—
Ife, Robert J.; Brown, Thomas H.; and Leach, Colin A., 5,006,535, Cl. 514-313.000.

Smith, Loren, to Robert Bosch GmbH. Coupler element. 5,005,878, Cl. 285-319.000.

Smith & Mahoney, P.C.: *See*—
Galgana, Russell J., 5,006,029, Cl. 414-327.000.

Smith, Roger C.: *See*—
Jennings, Alfred R., Jr.; and Smith, Roger C., 5,005,645, Cl. 166-280.000.

Smith, Samuel C. Device to display cover and pages of a document. 5,005,869, Cl. 281-15.100.

Smith, Terry E.; Cho, James R.; and Cottrell, Ian W., to GAF Chemicals Corporation. Solubilization of complexes of water-insoluble organic compounds by aqueous solutions of polyvinylpyrrolidone. 5,006,595, Cl. 524-548.000.

Smith, William A.; and Chen, Ji-Feng, to Cleveland Clinic Foundation, The. Heart pump having contractible guide mechanism for pusher plate. 5,006,104, Cl. 600-016.000.

Smith, William L. Electromagnetic sensor assembly. 5,006,797, Cl. 324-173.000.

SmithKline Beecham Corporation: *See*—
Lafferty, John J.; DeMarinis, Robert M., and Shah, Dinubhai H., 5,006,521, Cl. 514-215.000.

Smyly, George M., Sr. Separative trailer tongue hitching method. 5,005,852, Cl. 280-477.000.

Sneyd, James C. *See*—
Alikhan, Mir I.; Colrud, Sandra M.; and Sneyd, James C., 5,006,116, Cl. 604-365.000.

Snyder, Fred E. *See*—
Basile, Peter A., Madan, Ashvani K.; Snyder, Fred E., and Stillman, Harold M., 5,005,226, Cl. 4-354.000.

Sobotta, Rainer, Langbein, Adolf, Merz, Herbert, Bauer, Rudolf, and Mierau, Joachim, to Boehringer Ingelheim GmbH. Certain 3-bromo-2,6-dimethoxybenzamides and pharmaceutical use thereof. 5,006,533, Cl. 514-304.000.

Societe Anonyme: Carbone Industrie: *See*—
Gassiat, Alain L., 5,005,676, Cl. 188-218.0XL

S.A. Saurer Diederichs: *See*—

Societe de Fabrication de Material Orthopedique: *See*—
Cotrel, Yves, 5,005,562, Cl. 128-69.000

Societe Europeenne des Produits Refractaires: *See*—
Zanoli, Alain P. B.; and Recasens, Joseph, 5,005,635, Cl. 165-9.100.

Societe Moderne d Batiment Industriel: *See*—
Todisco, Serge, 5,005,330, Cl. 52-303.000

Soga, Tsunehiko: *See*—
Kusama, Tsuneo; Soga, Tsunehiko; and Shiba, Tetsuo, 5,006,647, Cl. 536-117.000.

Soga, Yoshinobu: *See*—
Itoh, Hiroshi; Sugaya, Masami; Soga, Yoshinobu; Morisawa, Kunio; Habuchi, Ryoji, Kouno, Katsumi, and Hattori, Yuji, 5,006,093, Cl. 474-28.000

Sohmiya, Norimasa *See*—
Koichi, Yasushi; Sohmiya, Norimasa; and Karasawa, Kazunori, 5,006,896, Cl. 355-246.000.

Solarex Corporation: *See*—
Gaddy, Edward M., 5,006,179, Cl. 136-244.000.

Soliman, Mohamed Y.; Kuhlman, Robert D., and Poulsen, Don K., to Halliburton Company. Method of determining fracture parameters for heterogenous formations. 5,005,643, Cl. 166-250.000.

Soll, David B., and Failla, Stephen J. Sclera and/or limbus marking device for use in intraocular surgery. 5,006,123, Cl. 606-166.000

Sollac. *See*—
DeSmet, Gabriel, 5,005,396, Cl. 72-309.000.

Sollinger, Hans-Peter, to J. M. Voith GmbH. Smoothing device of a coating applicator unit. 5,005,515, Cl. 118-100.000.

Solomon, James E., to Buckeye Steel Castings Company. Articulated railroad car connector. 5,005,715, Cl. 213-62.00A

Somack, Ralph: *See*—
Saifer, Mark, Somack, Ralph; and Williams, L. David, 5,006,333, Cl. 424-78.000

Somerhausen, Bernard: *See*—
Servais, Albert, and Somerhausen, Bernard, 5,006,418, Cl. 428-621.000

Someya, Akihiko, to Kabushiki Kaisha Toshiba. Thermal printing apparatus responsive to estimated stored heat of the heating element. 5,006,866, Cl. 346-76.0PH.

Sommer, Friedhelm: *See*—
Vetter, Hans; Ohlschlager, Hans; Odenwalder, Heinrich; Morcher, Bernhard; Sommer, Friedhelm, and Rosenhahn, Lothar, 5,006,457, Cl. 430-613.000.

Sommerfeld, Eugene G.: *See*—
Brasure, Donald E.; and Sommerfeld, Eugene G., 5,006,593, Cl. 524-520.000.

Sondergedl, Horst. Chair for an office or the like. 5,005,905, Cl. 297-320.000.

Sonntagbauer, Ernst, to Elin-Union Thyristor on-load change-over switch. 5,006,784, Cl. 323-343.000

Sontag, Heinz, Elias, Hartmut; Ludwig, Wolfgang, Fritzsch, Walter; Eschner, Wolfgang; Hundhausen, Rainer, and Kratz, Harald, to Dornier GmbH. Optical position detection. 5,005,979, Cl. 356-375.000.

Sony Corporation: *See*—
Catalano, Paul D., 5,005,713, Cl. 211-191.000.
Creed, David M., Wilkinson, James H., and Lawlor, Robert J. D., 5,006,927, Cl. 358-31.000.
Kobayashi, Junichiro, Hiramatsu, Shigeru; and Takakuwa, Hidemi, 5,006,478, Cl. 437-41.000.
Kodama, Yasumasa, 5,006,881, Cl. 354-484.000
Miyasaka, Kenji, 5,006,944, Cl. 360-99.060
Shirota, Norihisa, 5,006,931, Cl. 358-133.000
Usuki, Hideki, Kohri, Shumpei, Yano, Masatoshi; and Ishida, Hiroshi, 5,006,738, Cl. 307-594.000.

Sorensen, James C. *See*—
DiMartino, Stephen P., Sr.; and Sorensen, James C., 5,006,132, Cl. 55-16.000.

Sorensen, Joseph A., and Gatzemeyer, Dwight L., to Peterson Manufacturing Co., Inc. Hand tool or improved bar clamp. 5,005,449, Cl. 81-152.000.

Sosnowich, Michael P.: *See*—
Blackburn, William A., and Sosnowich, Michael P., 5,005,216, Cl. 2-79.000

Soultanian, Daniel S.: *See*—
Steiner, Robert E., and Soultanian, Daniel S., 5,005,252, Cl. 15-339.000.

Spacesaver Corporation: *See*—
Dahnert, Dean L., 5,005,923, Cl. 312-201.000.

Spangler, Earl M. Rocker shaft support system for internal combustion engine. 5,005,544, Cl. 123-195.00R.

Spangler, James B.; and Rector, Steve G., to McDonnell Douglas Corporation. Selectable chip carrier. 5,006,963, Cl. 361-417.000.

Sparton Corporation: *See*—
Vines, Arthur D.; Schonfeld, Frederick A.; and Espat, Ricardo, 5,006,841, Cl. 340-825.070

Spater, Stuart S. *See*—
Kolton, Chester; and Spater, Stuart S., 5,005,741, Cl. 223-85.000

Spear, A. Gil, Jr. *See*—
Berke, Joseph J.; Muller, George H.; and Spear, A. Gil, Jr., 5,005,964, Cl. 351-50.000.

Specified Equipment Systems Company, Inc.: *See*—
Kistner, Kenneth J., 5,005,765, Cl. 239-135.000.

Spectra-Physics, Inc.: *See*—
Nojiri, Howard H., 5,005,670, Cl. 186-61.000
Schorr, Theodore H., 5,005,329, Cl. 52-204.000.

Speedy Weedy, Inc.: *See*—
Parks, David W., Parks, Thomas A.; and Green, Raymond, 5,005,888, Cl. 294-50.000.

Speer, Larry W., to Eastman Kodak Company. Device for aiding in measuring pigmented marking particle level in a magnetic brush development apparatus. 5,005,516, Cl. 118-657.000.

Speer, Richard: *See*—
Grossman, Mark W.; Speer, Richard; and George, William A., 5,006,165, Cl. 75-407.000.

Spellman, Vernon C.: *See*—
Phillips, Roger W.; Spellman, Vernon C.; Gossett, Wayne L.; Kamerling, Marc A.; Coombs, Paul G.; Todd, David W.; and Silver, Steven A., 5,005,719, Cl. 215-230.000.

Spielberger, Seymour, to Barnes Engineering Company. Ballistic protective laser shield. 5,005,926, Cl. 350-1.100.

Spies, Manfred; and Heitz, Walter, to Bayer Aktiengesellschaft. Process for the production of SiO_2 containing polybenzamides. 5,006,636, Cl. 528-320.000.

Spitler, Michael L., to Chillynex Corporation. Thermal wraps. 5,005,374, Cl. 62-259.300.

Sprague Electric Company: *See*—
Ross, Sidney D., and Finkelstein, Manuel, 5,006,964, Cl. 361-504.000.

Sprout, James C.: *See*—
Schmuckal, Peter J.; Phillips, Mitchell S.; Keiper, Francis P., III; Sprout, James C.; and Fried, Ronald H., 5,007,081, Cl. 379-354.000.

Sprunger, Paul C.: *See*—
Briscoe, Terry L.; and Sprunger, Paul C., 5,005,304, Cl. 37-141.00R

Square D Company: *See*—
Raine, Peter D.; and Ophaug, Darrell P., 5,005,880, Cl. 292-17.000.

Square Head, Inc.: *See*—
Pare, Rodney H.; Tata, Peter D.; and Marrocco, Anthony R., 5,005,255, Cl. 16-115.000

Squillante, Peter L.; Egyud, Julius; and Karron, Abraham, to Franklin Electronic Publishers, Incorporated. Electronic thesaurus with access history list. 5,007,019, Cl. 364-900.000

Squire, Edward N., to Du Pont de Nemours, E. I., and Company. Amorphous copolymers of perfluoro-2,2-dimethyl-1,3-dioxole. 5,006,382, Cl. 428-35.700.

Sridhar, Manickam R.; Payton, John L.; and Bargoot, Carol A., to Codex Corporation. Adaptive rate control for echo cancelling modem. 5,007,047, Cl. 370-32.100

Stabler, Manfred. *See*—
Barth, Walter; Borst, Erich; Helm, Winfried; and Stabler, Manfred, 5,005,321, Cl. 51-170.00T

Stack Electronics Co., Ltd. *See*—
Noguchi, Hiroshi; and Kawada, Kazuo, 5,006,668, Cl. 174-75.00C.

Staefa Control System, Inc *See*—
Haessig, David L., 5,005,636, Cl. 165-16.000.

Stahlecker, Fritz, to Stahlecker, Hans, a part interest. Process and an arrangement for producing packages. 5,005,348, Cl. 57-87.000.

Stahlecker, Hans. *See*—
Stahlecker, Fritz, 5,005,348, Cl. 57-87.000.

Stamos, Mark E.: *See*—
Fields, Gary C., Stamos, Mark E., and Pena, Lawrence T., 5,007,077, Cl. 379-67.000.

Standard Oil Company, The. *See*—
Cheung, Lim H., 5,005,665, Cl. 181-101.000
Davis, James C., 5,006,256, Cl. 210-645.000.
Davis, James C., 5,006,287, Cl. 264-41.000.

Stanford University: *See*—
Steele, Charles R., 5,006,984, Cl. 364-413.270.

Stanley, John H., to Goodyear Tire & Rubber Company, The. Light weight flexible coaxial vapor recovery hose. 5,005,613, Cl. 141-45.000.

Stanley, Patricia M.: *See*—
Olson, Lynne A., and Stanley, Patricia M., 5,006,126, Cl. 8-401.000.

Stanley Works Limited, The *See*—
Gilbert, Richard, 5,005,290, Cl. 30-162.000.

Stanton, Dorothy R. Animal marking and urination control device. 5,005,525, Cl. 119-95.000

Stark, Johann: *See*—
Ritter, Joachim; and Stark, Johann, 5,005,683, Cl. 192-45.000

Staub, Norman C.: *See*—
Serikov, Vladimir; Rumm, Mark, and Staub, Norman C., 5,005,582, Cl. 128-691.000

Staub, Richard A.: *See*—
Wyatt, Richard J., Freed, William J., and Staub, Richard A., 5,006,122, Cl. 606-130.000

Stauffer, Charles C.: *See*—
Kibler, Jack M.; Schmotzer, Jack K., and Stauffer, Charles C., 5,005,430, Cl. 73-863.010.

Steadley Company: *See*—
Harmon, Lonnie R., 5,005,809, Cl. 267-103.000.

Stearns, Floyd E., to Eastman Kodak Company. Sheet separating device and apparatus for use therein. 5,006,903, Cl. 355-308.000.

Steele, Charles R., to Stanford University. Bone/tissue analyzer and method. 5,006,984, Cl. 364-413.270.

Steen, Henry B., III. *See*—
Buckman, William G.; Steen, Henry B., III; and Buckman, William G., Jr., 5,006,046, Cl. 417-54.000.

Steffero, Robert F., Sr., to Aqua Systems Division of Chem-Free, Inc. Water-treatment system. 5,006,240, Cl. 210-223.000.

Steffes, Helmut: *See*—
Reinartz, Hans-Dieter; Steffes, Helmut; Von Hayn, Holger; and Meier, Thomas, 5,005,350, Cl. 60-562.000.

Stegemoeller, Calvin L.: *See*—
Bragg, Dale E.; and Stegemoeller, Calvin L., 5,006,034, Cl. 414-555.000.

Stegherr, Ludolf. Means for positioning arched halving-joints of frame portions and for milling bevels into these frame portions. 5,005,618, Cl. 144-136.00R.

Stein, Fritz-Dieter: *See*—
Bransky, Olaf; Wiede, Guenter; Stein, Fritz-Dieter; and Helmreich, Gerhard, 5,007,090, Cl. 381-60.000.

Stein, Philip D.: *See*—
Hall, Steven E.; and Stein, Philip D., 5,006,542, Cl. 514-381.000.

Steinbrecher, Gary A. Leaper's obstacle. 5,005,827, Cl. 272-102.000.

Steine, Hans-Theo: *See*—
Simm, Wolfgang; Steine, Hans-Theo; and Streb, Karl P., 5,005,764, Cl. 239-79.000.

Steiner, Robert E.; and Soultanian, Daniel S., to Emerson Electric Co. Portable wet/dry vacuum cleaner and recharging base. 5,005,252, Cl. 15-339.000.

Steltenkamp, Robert J., to Colgate-Palmolive Co. Processes for repelling insects by means of N-alkyl neoalkanamide insect repellents. 5,006,562, Cl. 514-625.000

Stemmler, Kurt; Weckop, Ludwig; and Marth, Egon, to Winkler & Dunnebier Maschinenfabrik und Eisengiesserei KG. Interfolder device with dynamic pressure section connected at the outlet side of the folding rollers. 5,005,816, Cl. 270-39.000.

Stengele, Erich: *See*—
Tamm, Rolf; Huber, Bernhard; Rodel, Gunther, and Stengele, Erich, 5,005,976, Cl. 356-312.000.

Stenger, Claudia V.: *See*—
Huang, Shu-Jen W.; and Stenger, Claudia V., 5,006,261, Cl. 210-712.000.

Stepanik, Frank S.: *See*—
Baughman, Richard C.; Ellingham, David J.; Fowlkes, William Y., Rubin, Bruce J.; and Stepanik, Frank S., 5,006,900, Cl. 355-271.000

Stephens, Jerry B.; Jackson, Richard E.; and Conder, David H. Hydraulic jacking apparatus. 5,006,015, Cl. 405-230.000.

Stephens, Peter W. *See*—
Jenkins, Anthony; and Stephens, Peter W., 5,007,072, Cl. 378-88.000.

Stephenson, Malcolm I.: *See*—
Burton, David P.; Dillon, Paul A.; and Stephenson, Malcolm I., 5,006,796, Cl. 324-158.00F

Stern, Bradley M.; and Doane, James. Retractable sling for transporting coaster-type vehicles. 5,005,868, Cl. 280-814.000

Sternberg, Esther M.; Wilder, Ronald L.; Chrousos, George P.; and Gold, Philip W., to United States of America, Health and Human Services. Evaluative means for detecting inflammatory reactivity. 5,006,330, Cl. 424-9.000.

Sternberger, Klaus: *See*—
Martini, Thomas; Keil, Karl-Heinz, Karsunky, Ulrich; and Sternberger, Klaus, 5,006,129, Cl. 8-554.000.

Sternenberg, James E.: *See*—
Morris, Gene A.; Patel, Deepak C.; and Sternenberg, James E., 5,005,805, Cl. 251-229.000

Sterner, Carl L. Combination road repair machine with improved crack-filling capabilities. 5,006,012, Cl. 404-107.000.

Sterrett, Terry L.: *See*—
Pickrell, Floyd W., Jr.; Reher, James F.; and Sterrett, Terry L., 5,005,730, Cl. 221-71.000.

Steudle, Ernst; and Stumpf, Burkhard, to Steudle, Ernst. Process and apparatus for the determination of the concentration of a substance dissolved in a solvent by means of an osmometer. 5,005,403, Cl. 73-64.300

Stevens, Brad: *See*—
Achille, Felix; Stevens, Brad; and Clingerman, George, 5,006,383, Cl. 428-35.900.

Stevens, Rodney W.: *See*—
Kitaura, Yoshihiko; Ito, Fumitaka, Stevens, Rodney W.; and Asai, Nobuko, 5,006,541, Cl. 514-367.000

Stevens, Vernon C., to Ohio State University, The. Antigenic modification of polypeptides. 5,006,334, Cl. 424-88.000.

Steward, Wayne D. *See*—
Fenne, Kenneth R., Steward, Wayne D., and Didyk, Witaly, 5,006,779, Cl. 320-2.000

Stewart, David B. *See*—
Stewart, William R.; and Stewart, David B., 5,005,259, Cl. 19-97.000.

Stewart, James J.: *See*—
Dietrich, Joseph J.; Niksa, Andrew J.; and Stewart, James J., 5,006,216, Cl. 204-257.000

Stewart, Kenneth W., Sr., to United Technologies Motor Systems, Inc. Dynamoelectric machine brush rigging and method of assembly. 5,006,747, Cl. 310-239.000.

Stewart, William R., and Stewart, David B., to William R. Stewart & Sons Ltd. Opening roller for open end spinning machines. 5,005,259, Cl. 19-97.000.

Stiles, Richard C.: *See*—
Marks, Larry D.; Stiles, Richard C.; and Bartloff, William F., 5,005,740, Cl. 222-651.000.

Stillman, Harold M.: *See*—
Basile, Peter A.; Madan, Ashvani K.; Snyder, Fred E.; and Stillman, Harold M., 5,005,226, Cl. 4-354.000

Stocko Metallwarenfabriken Henkels und Sohn GmbH & Co *See*—
Obst, Frank, 5,005,752, Cl. 227-114.000.

Stoffelen, Henricus J. H.: *See—*
Hasker, Jan; Crombeen, Jacobus E.; Niessen, Anton K.; and Stoffelen, Henricus J. H., 5,006,753, Cl. 313-346.00R

Stokes, John F., to Honeywell Inc. Method of making an electrostatic silicon accelerometer. 5,006,487, Cl. 437-228.000.

Stokes, Rick W. Paper rack. 5,005,709, Cl. 211-50.000.

Stokke, Olaf M.; Flanigan, David A.; Ramsey, Robert B., Williams, Robert E.; and Huycke, John, to Conoco Inc. Partially halogenated ethane solvent removal of oleophylic materials from mineral particles. 5,005,655, Cl. 175-66.000.

Stone, Herman, to PMC, Inc. Density reduction in flexible polyurethane foams. 5,006,569, Cl. 521-118.000.

Stone & Webster Engineering Corporation: *See—*
Karafian, Maxim, and Tsang, Irving C., 5,006,131, Cl. 422-201.000.

Stoody, William R. Flaccid bag bottle for dispensers. 5,005,733, Cl. 222-105.000.

Strand, Marc A.: *See—*
Jackson, Winston J., Jr.; Darnell, W. Ronald; Bell, Bruce C.; and Strand, Marc A., 5,006,628, Cl. 528-182.000.

Strang, Harry: *See—*
Fischer, Reiner; Jensen-Korte, Uta; Kunisch, Franz; Marhold, Albrecht, Ooms, Pieter; Schallner, Otto; Santel, Hans-Joachim; Schmidt, Robert R.; Krauskopf, Birgit; and Strang, Harry, 5,006,148, Cl. 71-72.000.
Gesing, Ernst R.; Santel, Hans-Joachim; Schmidt, Robert R.; and Strang, Harry, 5,006,156, Cl. 71-93.000.

Strassel, Albert: *See—*
Guerin, Bernard; and Strassel, Albert, 5,006,602, Cl. 525-72.000.

Streb, Karl P.: *See—*
Simm, Wolfgang; Steine, Hans-Theo; and Streb, Karl P., 5,005,764, Cl. 239-79.000.

Stresswave Technology Limited: *See—*
Holroyd, Trevor J., 5,005,415, Cl. 73-587.000.

Strobl, Georg; and Wong, Ben T., to Johnson Electric S.A. Splashproof cover for an electric motor. 5,006,742, Cl. 310-88.000.

Strong, Finn A. Aquarium assembly. 5,005,521, Cl. 119-5.000.

Strong, Thomas F. Automatic proportioning fertilizer injector. 5,005,601, Cl. 137-205.500.

Stroppiana, Mario; and Ronchetti, Luigi, to RAI Radiotelevisions Italiano, S.p.A. Device for reducing the redundancy in blocks of digital video data in DCT encoding. 5,006,930, Cl. 358-133.000.

Stroppiana, Mario: *See—*
Barbero, Marzio; Muratori, Mario; and Stroppiana, Mario, 5,006,929, Cl. 358-105.000.

Stuck, Robert M.; and Maw, Samuel H., Jr. Apparatus and method for cooking food products, specially for broiling whole chickens and other meats. 5,006,355, Cl. 426-243.000.

Stumpf, Burkhard: *See—*
Steudle, Ernst, and Stumpf, Burkhard, 5,005,403, Cl. 73-64.300.

Stutzel, Klaus: *See—*
Ludwig, Karl; van Raemdonck, Edwin, Stutzel, Klaus, and Vingerhoets, Marcel, 5,006,654, Cl. 544-219.000.

Suda, Hirofumi: *See—*
Kaneda, Naoya; Wada, Hiroyuki; Hirasawa, Masahide, and Suda, Hirofumi, 5,005,956, Cl. 350-429.000.

Sueoka, Hiroyuki: *See—*
Oe, Takanori; Sueoka, Hiroyuki; Hisadome, Masao; and Yamagami, Keiji, 5,006,520, Cl. 514-212.000.

Suessegger, Albert, to Kloeckner-Humbolt-Deutz Aktiengesellschaft. Sifter for sifting granular material and grinding system having introduction therein to of such a sifter. 5,005,770, Cl. 241-19.000.

Suga, Toshiyuki; Arai, Hideaki, and Kitajima, Shinichi, to Honda Giken Kogyo Kabushiki Kaisha. Abnormal combustion-detecting device and combustion control device for internal combustion engines. 5,005,547, Cl. 123-425.000.

Sugahara, Kazuyuki, Kusunoki, Shigeru; and Ipposhi, Takashi, to Mitsubishi Denki Kabushiki Kaisha. Stacked type semiconductor device. 5,006,913, Cl. 357-41.000.

Sugahara, Satoshi: *See—*
Takiguchi, Haruhisa; Kudo, Hiroaki; Sakane, Chitose; and Sugahara, Satoshi, 5,007,107, Cl. 372-96.000.

Sugano, Kazuhiko, to Nissan Motor Co., Ltd. Shift control system for automatic transmission. 5,005,443, Cl. 74-868.000.

Sugaya, Masami: *See—*
Itoh, Hiroshi; Sugaya, Masami; Soga, Yoshinobu; Morisawa, Kunio; Habuchi, Ryoji; Kouno, Katsumi; and Hattori, Yuji, 5,006,093, Cl. 474-28.000.

Sugimoto, Fumio: *See—*
Shii, Hikaru; and Sugimoto, Fumio, 5,006,292, Cl. 264-127.000.

Sugimoto, Mutsumi, to Katsuyama Kinzoku Kogyo Kabushiki Kaisha. Buckle assembly for seat belt. 5,005,267, Cl. 24-637.000.

Sugimoto, Yoichi: *See—*
Yahagi, Toshio, Iwagawa, Yoshihiro; Sugimoto, Yoichi; and Satoh, Tsuyoshi, 5,005,917, Cl. 303-113.000.

Sugiyama, Genroku: *See—*
Hirata, Toichi; Tanaka, Hideaki, Sugiyama, Genroku; and Kajita, Yusuke, 5,005,358, Cl. 60-426.000.

Sugiyama, Isao: *See—*
Kamiya, Takashi; Naito, Toshihiko; Negi, Shigeto; Komatu, Yuuki; Kai, Yasunobu; Nakamura, Takaharu; Sugiyama, Isao; Machida, Yoshimasa; Nomoto, Seiichiro; Kitoh, Kyosuke, Katsu, Kanemasa; and Yamauchi, Hiroshi, 5,006,649, Cl. 540-222.000.

Sugiyama, Kazuhiro: *See—*
Kawabe, Masanao; Kimura, Masao; Sugiyama, Kazuhiro, Yamaoka, Ikuro; and Inoue, Hiroharu, 5,006,631, Cl. 528-204.000.

Sugiyama, Keishi: *See—*
Ichitsubo, Norio; and Sugiyama, Keishi, 5,006,080, Cl. 439-634.000.

Sugiyama, Takeshi, to Mitsubishi Denki Kabushiki Kaisha. Pinion shift lever starter with waterproof boat. 5,005,435, Cl. 74-7.00A.

Sugiyama, Yuichi; Isono, Takashi; Nakamura, Yukihiro; Takaiwa, Akihiro; and Komatsubara, Kenichi, to SDS Biotech Kabushiki Kaisha. Imino[(3-halogenophenyl)amino]acetic acid derivatives and herbicides containing same. 5,006,160, Cl. 71-111.000.

Sullivan, Shelby F., Whitehouse, Harper J.; and Hamilton, Richard P., to United States of America, Navy. Transducer assembly for deep submergence. 5,007,030, Cl. 367-153.000.

Sulzer Brothers Limited: *See—*
Mandrin, Charles, and Keller, Rene, 5,006,133, Cl. 55-53.000.

Sumigawa, Yukio, to Sanshin Kogyo Kabushiki Kaisha. Tilting device for marine propulsion unit. 5,006,083, Cl. 440-61.000.

Sumitomo Chemical Company, Limited: *See—*
Tsushima, Kazunori, Matsuo, Noritada; Kisida, Hiroshi; and Yano, Toshihiko, 5,006,538, Cl. 514-345.000.

Sumitomo Electric Industries, Ltd.: *See—*
Fujioka, Hideaki; and Katayama, Yoshio, 5,005,916, Cl. 303-103.000.
Yamamoto, Susumu; Murai, Teruyuki; Kawabe, Nozomu; and Tobioka, Masaaki, 5,006,289, Cl. 264-61.000.

Sumitomo Metal Industries, Ltd. *See—*
Yasumura, Ichiro; and Fujimoto, Kuniharu, 5,005,395, Cl. 72-128.000.

Sumitomo Metal Mining Company Limited: *See—*
Kishimoto, Toshiki; and Imamura, Kuniyasu, 5,006,199, Cl. 156-621.000.
Kuzuo, Ryuichi; Kawamoto, Atsushi; Tada, Junya; Ohmori, Kenji; and Sekiya, Hiroko, 5,006,388, Cl. 428-64.000.

Sumitomo Rubber Industries Inc. *See—*
Kinuhata, Satoru, Takami, Masao; Shibata, Eiji; and Tamura, Tadahiko, 5,005,628, Cl. 157-13.000.

Sumitomo Rubber Industries, Ltd.. *See—*
Oka, Kengo, 5,005,838, Cl. 273-232.000.
Touji, Daijiro, Nakahara, Akihiro, Nakashita, Takefumi; Mitsuba, Atsuko, Nakashio, Yukiyasu, and Nagase, Tsuneyuki, 5,006,586, Cl. 524-377.000.

Sundstrand Corporation: *See—*
Danby, Clive M., 5,006,772, Cl. 318-696.000.
Katsumata, Shin; and Corcoran, Mark W., 5,006,043, Cl. 415-113.000.
Rees, Fenton, 5,006,774, Cl. 318-721.000.
Rozman, Gregory I., 5,006,768, Cl. 318-254.000.
Schott, Edmund A., 5,006,741, Cl. 310-68.00D.

Sundstrand Data Control, Inc *See—*
Novack, Mitchell J., Norling, Brian L.; and Woodruff, James R., 5,005,413, Cl. 73-517.0AV.

Susan, Victor R *See—*
Sanchez, Florentina S.; Susan, Victor R.; Carramolino-Fitera, Laura, and Ortega, Agustin P. A., 5,006,471, Cl. 435-254.000.

Suyama, Koji: *See—*
Maruyama, Fumio; Suyama, Tomio; Kamino, Hiroaki; Suyama, Koji, Kuwahara, Tokihiro; and Nagata, Osamu, 5,006,767, Cl. 318-103.000.

Suyama, Tomio: *See—*
Maruyama, Fumio; Suyama, Tomio, Kamino, Hiroaki; Suyama, Koji, Kuwahara, Tokihiro, and Nagata, Osamu, 5,006,767, Cl. 318-103.000.

Suzuki, Akira. *See—*
Ishida, Masato, Takeda, Hiroaki; Watanabe, Kazuo; Suzuki, Akira; Suzuki, Nobuyuki, Sato, Isamu; and Miyamato, Kazuki, 5,006,890, Cl. 355-202.000.

Suzuki, Fuminori, and Ebihara, Heihachiro, to Citizen Watch Co., Ltd. Liquid crystal television. 5,006,933, Cl. 358-236.000.

Suzuki, Hideo, Matsushima, Shunichi; Obata, Masahiko; Sakama, Masao; Nakada, Akira, and Kumano, Shinji, to Yamaha Corporation Musical tone control apparatus. 5,005,460, Cl. 84-600.000.

Suzuki, Hideo. *See—*
Adachi, Takeshi; Mizuno, Kotaro; Yamada, Shigeru; Suzuki, Hideo, and Kimpara, Mamoru, 5,005,459, Cl. 84-453.000.

Suzuki, Kazuo, Tachibana, Fusao; and Chonan, Mitsugi, to Fuji Jukogyo Kabushiki Kaisha. Two cycle engine with fuel injector. 5,005,533, Cl. 123-52.0MB.

Suzuki, Kenji, to Fuji Photo Film Co., Ltd. Photographic printer. 5,006,886, Cl. 355-46.000.

Suzuki, Nobuyuki. *See—*
Ishida, Masato; Takeda, Hiroaki; Watanabe, Kazuo; Suzuki, Akira, Suzuki, Nobuyuki, Sato, Isamu; and Miyamato, Kazuki, 5,006,890, Cl. 355-202.000.

Suzuki, Norio; Oda, Sennosuke, Maruyama, Hiromi; and Hoshino, Kenichi, to Matsushita Electric Industrial Co., Ltd. Alkaline storage battery. 5,006,426, Cl. 429-94.000.

Suzuki, Seizo; Sakuma, Nobuo, Yamaguchi, Katsumi; and Endo, Osamu, to Ricoh Company, Ltd. Optical scanning system. 5,005,928, Cl. 350-6.100.

Suzuki, Seizo: *See—*
Okamoto, Osamu; Nakaya, Teruomi; Suzuki, Seizo; Kuwano, Naoaki; Sakai, Yoshinori; Oda, Hiroshi; Uegusa, Masao; and Iba, Goji, 5,005,786, Cl. 244-161.000.

Suzuki, Tadasu, to Tsubakimoto Chain Co. Ratchet type tensioner. 5,006,095, Cl. 474-111.000.

Suzuki, Takamitsu; Iwanami, Takeshi; and Yonezawa, Minoru, to Yamaha Hatsudoki Kabushiki Kaisha; Yamaha Hatsudoki Kabushiki Kaisha; and Yamaha Hatsudoki Kabushiki Kaisha. Engine induction system. 5,005,536, Cl. 123-52.0MV.

Suzuki, Takanobu; and Furusawa, Tsutomu, to Fuji Xerox Co., Ltd. Recording apparatus. 5,007,003, Cl. 364-519.000.

Suzuki, Tetsuro: *See—*
Yoshikawa, Masao; and Suzuki, Tetsuro, 5,006,915, Cl. 357-61.000.

Suzuki, Toshio: *See—*
Kasuya, Akira; and Suzuki, Toshio, 5,006,580, Cl. 524-264.000.
Magara, Takuji, Iwasaki, Takeshi, Suzuki, Toshio; and Yamamoto, Masahiro, 5,006,692, Cl. 219-69.120.

Suzuki, Yoshio; Umeda, Kaoru; and Kitoh, Norimasa, to Honda Giken Kogyo Kabushiki Kaisha; and Kabushiki Kaisha Imasen Denki Seisakusho Reclining device. 5,005,906, Cl. 297-362.000.

Swaneck, Edward H. Sheet register control for printing machines. 5,005,819, Cl. 271-107.000.

Swanson, Dail L.; and Costa, Larry J., to Valmont Industries, Inc. Fluorescent lamp ballast with end connector. 5,006,764, Cl. 315-276.000.

Swanson, John H.: *See—*
Van Gordon, Todd D.; Swanson, John H.; Kristensen, Knud N.; and Sherman, Adam, 5,005,734, Cl. 222-107.000.

Swanson, Steven E.: *See—*
Barlow, Robert W., Swanson, Steven E.; and Lynch, Thomas M., 5,005,941, Cl. 350-96.210
Barlow, Robert W., Lynch, Thomas M.; and Swanson, Steven E., 5,005,942, Cl. 350-96.210.

Swedberg, Sally A., to Hewlett-Packard Company. Halogenated surface with reduced protein interaction. 5,006,313, Cl. 422-70.000.

Swimex Systems, Inc *See—*
Mermelstein, Seymour, 5,005,228, Cl. 4-488.000

Swisher, Beth A. *See—*
Markley, Lowell D.; Hamilton, Christopher T.; Swisher, Beth A.; and Secor, Jacob, 5,006,159, Cl. 71-98.000

Swiss Serum & Vaccine Institute *See—*
Gluck, Reinhard, and Germanier, Rene, 5,006,335, Cl. 424-89.000.

Syrett, Barry C *See—*
McKubre, Michael C. H.; and Syrett, Barry C., 5,006,786, Cl. 324-71.200

Szabados, Rudolph J. *See—*
Berg, Lloyd; Wendt, Kraig M., and Szabados, Rudolph J., 5,006,205, Cl. 203-15.000

Szafranski, Pierre, to Salomon S.A. Alpine safety ski binding. 5,005,854, Cl. 280-626.000.

Szajewski, Richard P.; Burns, Paul A., Poslusny, Jerrold N.; Platt, Norma B., and Norden, Timothy D., to Eastman Kodak Company. Photographic material and process. 5,006,448, Cl. 430-505.000.

Szego, Andras *See—*
Sarkozy, Peter, Pap, Laszlo, Szego, Andras; Nagy, Lajos; Szekely, Istvan, Marmarosi, Katalin, and Grosch, Janos, 5,006,545, Cl. 514-395.000.

Szekely, Istvan *See—*
Sarkozy, Peter, Pap, Laszlo, Szego, Andras, Nagy, Lajos; Szekely, Istvan, Marmarosi, Katalin, and Grosch, Janos, 5,006,545, Cl. 514-395.000

Szekszardi Allami Gazdasag KSZE Novenytermelesi Rendszer: *See—*
Kiss, Laszlo, Justus, Gyula; Zsuppan, Jozsef, and Knollmar, Tibor, 5,006,149, Cl. 71-81.000

Szewczyk, Robert M., to Raytheon Company. Optical fuze. 5,005,480, Cl. 102-213.000

Szumski, Ronald P *See—*
Cameron, Evan S., Szumski, Ronald P., and West, James K., 5,006,721, Cl. 250-561.000

T Cell Sciences, Inc.: *See—*
Kung, Patrick C., Ip, Stephen, Brown, Michael; and McKeen, Linda A., 5,006,459, Cl. 435-5.000

Tachi S Co., Ltd *See—*
Nagata, Kojiro, 5,005,894, Cl. 296-68.100
Ogasawara, Hiromitsu, 5,006,771, Cl. 318-568.100

Tachibana, Fusao: *See—*
Suzuki, Kazuo, Tachibana, Fusao, and Chonan, Mitsugi, 5,005,533, Cl. 123-52.0MB

Tachibana, Tetsuo *See—*
Isono, Osamu, Fukui, Toshimasa, Nishino, Tetsuo; Tachibana, Tetsuo; and Iwabuchi, Eisuke, 5,007,055, Cl. 371-32.000

Tachikawa, Hiromichi *See—*
Yokoya, Hiroaki, and Tachikawa, Hiromichi, 5,006,433, Cl. 430-49.000

Tada, Junya *See—*
Kuzuo, Ryuichi, Kawamoto, Atsushi; Tada, Junya, Ohmori, Kenji; and Sekiya, Hiroko, 5,006,388, Cl. 428-64.000

Tagasangyo, Ltd.: *See—*
Tamura, Kozo; Kodato, Toshiharu; Nihira, Syoichi; Tsukamoto, Yasuhiro; and Iida, Akira, 5,006,780, Cl. 320-54.000.

Taguchi, Masao, to Fujitsu Limited. Semiconductor memory device and method for producing the same. 5,006,910, Cl. 357-23.600.

Taiyo Fishery Co., Ltd.: *See—*
Nishi, Norihisa; Nakamura, Makoto; and Noguchi, Satoshi, 5,006,353, Cl. 426-231.000

Taiyo Yuden Co., Ltd.: *See—*
Kakinuma, Hiromi; and Iida, Hideo, 5,006,702, Cl. 250-208.100.
Kishi, Hiroshi; Chazono, Hirokazu; Oshio, Minoru; Saito, Hiroshi; Nakamura, Toshiya; and Shizuno, Hisamitsu, 5,006,954, Cl. 361-321.000
Kishi, Hiroshi; Chazono, Hirokazu; Oshio, Minoru; Saito, Hiroshi; Nakamura, Toshiya; and Shizuno, Hisamitsu, 5,006,955, Cl. 361-321.000.
Ueda, Syuusaku; and Fujimoto, Masayuki, 5,006,491, Cl. 501-96.000.

Takabayashi, Yasuhiro, to Fuji Electric Co., Ltd. Method and apparatus for controlling the temperature of a reforming reaction catalyst. 5,006,425, Cl. 429-23.000.

Takada, Shun: *See—*
Sasaki, Masao; Nishijima, Toyoki; Takada, Shun, and Onodera, Kaoru, 5,006,454, Cl. 430-546.000.

Takada, Yoshiharu: *See—*
Hatano, Sakae; Takada, Yoshiharu, Kainuma, Kiyokazu; Kanematsu, Isao; Asano, Kazuo, Yoshida, Hisashi; and Mori, Yoshinori, 5,006,685, Cl. 219-69.200.

Takagi, Nobukazu: *See—*
Shimoda, Tatsuya, Seto, Takeshi; Endo, Kenichi; Yamaha, Yoshikazu; and Takagi, Nobukazu, 5,006,045, Cl. 417-42.000.

Takagi, Tadao; and Sato, Toshihiro, to Nikon Corporation. Electronic flash lighting device for camera. 5,006,879, Cl. 354-413.000.

Takahashi, Daisuke: *See—*
Onmori, Shozo; Takahashi, Daisuke; and Oishi, Kengo, 5,006,947, Cl. 360-132.000.

Takahashi, Fumio: *See—*
Yoneshima, Kunihiko; and Takahashi, Fumio, 5,006,277, Cl. 252-301.60S.

Takahashi, Masami; and Kajiya, Ichiro, to Matsushita Electric Industrial Co., Ltd. Lens mounting apparatus for a television camera. 5,005,948, Cl. 350-252.000.

Takahashi, Nagashige; and Ouchi, Teruo, to Asahi Kogaku Kogyo Kabushiki Kaisha. Flexible tube of endoscope and method of and apparatus for producing the same. 5,005,755, Cl. 228-126.000.

Takahashi, Osamu; Sakai, Minoru; Furusawa, Genichi; and Hirano, Tsumoru, to Fuji Photo Film Co. Ltd. Silver halide color photographic material having improved dye image stability. 5,006,453, Cl. 430-546.000.

Takahashi, Ryo: *See—*
Ogino, Sumihito; and Takahashi, Ryo, 5,005,492, Cl. 108-145.000

Takahashi, Tsutomu: *See—*
Kurihara, Kazumasa; and Takahashi, Tsutomu, 5,005,687, Cl. 192-0.073.

Takaiwa, Akihiro: *See—*
Sugiyama, Yuichi; Isono, Takashi, Nakamura, Yukihiro; Takaiwa, Akihiro; and Komatsubara, Kenichi, 5,006,160, Cl. 71-111.000.

Takaki, Takeshi; Kaijiri, Kouhei; Oda, Denichi; Oda, Kunio, Kurihara, Hideo; and Tanabe, Takeshi, to Ube Industries, Ltd. Fiber-reinforced rubber composition and production process and use thereof. 5,006,603, Cl. 525-105.000.

Takaku, Hitoshi, to Jidosha Kiki Co., Ltd. Brake booster. 5,005,464, Cl. 91-6.000.

Takakuwa, Hidemi: *See—*
Kobayashi, Junichiro; Hiramatsu, Shigeru; and Takakuwa, Hidemi, 5,006,478, Cl. 437-41.000.

Takamatsu, Toshiaki: *See—*
Hamada, Hiroshi, Takamatsu, Toshiaki, and Kimura, Naofumi, 5,006,840, Cl. 340-784.000.

Takami, Masao: *See—*
Kinuhata, Satoru, Takami, Masao; Shibata, Eiji; and Tamura, Tadahiko, 5,005,628, Cl. 157-13.000.

Takanashi, Itsuo, Tanaka, Hedeshi; Kato, Shigeru, Osada, Naomi; and Ichito, Toshikatsu, to Victor Company of Japan, Ltd. Cartridge for a printer system. 5,005,998, Cl. 400-208.000.

Takanashi, Itsuo; Nakagaki, Shintaro, and Shinonaga, Hirohiko, to Victor Company of Japan, Ltd. Charge latent image recording reproducing system with a uniformly charge detection region providing a reference intensity of a recorded object. 5,006,935, Cl. 358-300.000.

Takano, Masami; Hamada, Tetsurou, and Masuda, Katsuhiko, to Honda Giken Kogyo Kabushiki Kaisha. Torque transmitting device. 5,005,685, Cl. 192-58.00B

Takao, Toshiyuki; and Igata, Toshiaki, to Fuji Photo Film Co., Ltd. Information recording medium. 5,006,387, Cl. 428-64.000.

Takase, Isao; Takemoto, Haruki, Tatsuta, Mitsugu; Maseki, Shinobu, Kano, Takenori, Yokoyama, Fumitomo; and Niimi, Mamoru, to Aisin Aw Co., Ltd. Floating structure for interconnecting three clutches with a single actuator in an automatic transmission. 5,006,102, Cl. 475-282.000

Takashimizu, Satoru: *See—*
Kimura, Yuichiro; Kabuto, Nobuaki; Takashimizu, Satoru, and Masujima, Katsuhiro, 5,006,739, Cl. 307-270.000

Takatori, Yasushi: *See—*
Ayata, Naoki, Shirato, Yoshiaki, Takatori, Yasushi, and Seki, Mitsuaki, 5,006,864, Cl. 346-33.00R

Takeda Chemical Industries, Ltd. *See*—
Oshima, Junji, Fuji, Tatsuo; and Yamada, Minoru, 5,006,592, Cl 524-504.000.
Takeda, Hiroaki. *See*—
Ishida, Masato; Takeda, Hiroaki; Watanabe, Kazuo, Suzuki, Akira, Suzuki, Nobuyuki, Sato, Isamu, and Miyamato, Kazuki, 5,006,890, Cl 355-202.000.
Takeda, Hisao, and Kawano, Mutsumi, to Kyoritsu Yuki Co., Ltd Process for the preparation of dispersion of water-soluble cationic polymer, 5,006,590, Cl. 524-458.000
Takefuta, Hideyasu *See*—
Kushida, Takeo, Takefuta, Hideyasu, and Muramatsu, Hajime, 5,005,412, Cl 73-517.00R.
Takegahara, Takashi *See*—
Seki, Masaki, Takegahara, Takashi, and Kajitani, Akira, 5,006,977, Cl. 364-192.000
Takeishi, Kazuo; Okubo, Yasuhiro; and Itoh, Takashi, to Director General, Public Works Research Institute, Ministry of Construction, and Nishihara Environmental Sanitation Research Corporation Limited Process for treating organic waste water 5,006,251, Cl 210-618.000.
Takemoto, Haruki: *See*—
Takase, Isao, Takemoto, Haruki, Tatsuta, Mitsugu, Maseki, Shinobu, Kano, Takenori, Yokoyama, Fumitomo, and Niimi, Mamoru, 5,006,102, Cl 475-282.000
Takeuchi, Akira *See*—
Ohba, Nobuyuki, Ikeda, Atsuhiko, Matsunari, Kenji Yamada, Yuji, Hirata, Michiya, Nakamura, Yasuo, Takeuchi, Akira, and Karino, Hiroyuki, 5,006,157, Cl 71-95.000
Takeuchi, Yoshinori *See*—
Satoh, Yutaka, and Takeuchi, Yoshinori, 5,005,859, Cl 280-721.000
Takeuti, Humio *See*—

Tsinberg, Mikhail, to North American Philips Corporation. High definition multiple analog component amplitude modulated television transmission system. 5,006,926, Cl. 358-12.000.
Tsubakimoto Chain Company *See—*
Ohmura, Kazumi; Nishiyama, Jun; and Chayama, Yukio, 5,005,487, Cl 104-292.000
Suzuki, Tadasu, 5,006,095, Cl. 474-111.000
Tsubakimoto Emerson Co *See—*
Fuji, Shunji, 5,005,684, Cl. 192-56.00R.
Tsuji, Kenji *See—*
Katoh, Takehiro; Azuma, Yoshihiko, Hirano, Masayasu, Kageyama, Naohiro; Ishimura, Toshihiko; Tsuji, Kenji, and Ootsuka, Hiroshi, 5,006,877, Cl. 354-412.000.
Tsuji, Yasuyuki *See—*
Saito, Susumu; Arimoto, Akira; Mochizuki, Takeshi, Tsuji, Yasuyuki; Ohshima, Minoru; and Seino, Minoru, 5,006,705, Cl 250-235.000
Tsukada, Nobuo *See—*
Kasuga, asao; Mori, Takayuki; and Tsukada, Nobuo, 5,006,746, Cl 310-323.000
Tsukamoto, Masahide; Nishimura, Yutaka, and Fukui, Yasuo, to Matsushita Electric Industrial Co., Ltd. Coating method and cleaning method for heat-soluble material. 5,006,189, Cl. 156-247.000.
Tsukamoto, Yasuhiro *See—*
Tamura, Kozo; Kodato, Toshiharu; Nihira, Syoichi; Tsukamoto, Yasuhiro; and Iida, Akira, 5,006,780, Cl 320-54.000
Tsushima, Kazunori. Matsuo, Noritada, Kisida, Hiroshi, and Yano, Toshihiko, to Sumitomo Chemical Company, Limited Certain insecticidal 6-(phenoxy-2-pyridyl)-methyl-neophental ethers. 5,006,538, Cl 514-345.000
Tsutsu, Noriko; Nakata, Yoshiro; and Esaki, Hideya, to Matsushita Electric Industrial Co., Ltd. Method of evaluating a semiconductor device and an apparatus for performing the same. 5,006,717, Cl 250-484.100
Tsuzuki, Kazuo, to NEC Corporation. Integrated communications system for HDLC variable-length data packets and fixed-length voice/video packets 5,007,045, Cl. 370-94.100.
Tubauto: *See—*
Caillol, Andre, 5,005,907, Cl. 297-362.000
Tucek, Miroslav, and Scrap freezing tunnel. 5,005,377, Cl. 62-374.000
Tungsram Reszvenytarsasag: *See—*
Nagel, Ferenc; and Farkasne, Maria J., 5,006,489, Cl. 501-15.000.
Turley, W Dale: *See—*
Noel, Bruce W., Borella, Henry M.; Cates, Michael R.; Turley, W Dale; MacArthur, Charles D.; and Cala, Gregory C., 5,005,984, Cl. 374-29.000.
Turner, James B., to Boeing Company, The. Autotuned resonant power source 5,006,973, Cl. 363-34.000.

Turney, David L., and Relson, Morris, to Gulton Industries, Inc Magnetically operated display device 5,005,305, Cl 40-449.000
Turning, Inc *See—*
Kooiker, Mark S., 5,005,279, Cl 29-426.500
Turning the Tables, Inc *See—*
Ryan, Kyle A., Ackerman, Michael, Hale, Bruce, and Payne, Ward, 5,005,639, Cl. 273-240.000
Turuda, Shigeto *See—*
Motonari, Kazunori, Kumamoto, Kazuo; Turuda, Shigeto; Ito, Yutaka, and Mitsutake, Taiichiro, 5,006,411, Cl 428-421.000
Tusim, Martin H., and Grimes, James T., to Dow Chemical Company, The Anti-clumping agents for expandable vinylaromatic-acrylonitrile polymeric materials 5,006,565, Cl 521-57.000.
Tuttup, Robert *See—*
Webster, Jeffrey, Richey, Stephen, and Tuttup, Robert, 5,005,410, Cl 73-335.000
Tyrrell, Paul C., Backes, Johannes B., McCormick, David D., and Jesse, John F., to Rival Manufacturing Company Automatic shut-off and alarm for electric heater 5,007,103, Cl 219-363.000
Ube Industries, Ltd *See—*
Motonari, Kazunori, Kumamoto, Kazuo, Turuda, Shigeto, Ito, Yutaka, and Mitsutake, Taiichiro, 5,006,411, Cl 428-421.000
Takaki, Takeshi, Kaijiri, Kouhei, Oda, Denichi, Oda, Kunio, Kurihara, Hideo, and Tanabe, Takeshi, 5,006,603, Cl 525-105.000
Uccellini, Rinaldo G *See—*
Jones, John, and Uccellini, Rinaldo G., 5,005,659, Cl 180-65.100
Uchida, Katsuyuki, and Fujiwara, Hiroto, to Murata Manufacturing Co., Ltd Face-like heating device 5,006,696, Cl 219-505.000
Uchikawa, Akira, to Japan Electronic Control Systems Co., Ltd. Oxygen concentration-detecting apparatus 5,006,221, Cl 204-426.000.
Udagawa, Mari *See—*
Yasunobu, Chizuko, Mori, Fumihiko, Ohata, Hideo, Udagawa, Mari, Inaba, Kenchiro, Hida, Kenichi, and Satoh, Yumiko, 5,006,998, Cl 364-513.000
Ueda, Kenichiro *See—*
Nakamura, Katsunari, Ueda, Kenichiro, Irie, Yoshirou, Hoshi, Toyokazu, and Kawakami, Motozo, 5,006,996, Cl. 364-478.000
Ueda, Shinji *See—*
Moriyaki, Masakazu, Ishikawa, Takatoshi, Andoh, Kazuto; Seto, Nobuo, Koshimizu, Toshio, and Ueda, Shinji, 5,006,456, Cl 430-372.000
Ueda, Syuusaku, and Fujimoto, Masayuki, to Taiyo Yuden CO., Ltd Process for production of nitride ceramic shapes 5,006,491, Cl 501-96.000
Uede, Hisashi *See—*
Fujioka, Yoshide, Ohba, Toshihiro, Kanatani, Yoshiharu, and Uede, Hisashi, 5,006,838, Cl 340-781.000

van Zanten, Anton, and Kost, Friedrich, to Robert Bosch GmbH. Circuitry for converting a measurement signal disturbed by a disturbance function into an undisturbed signal. 5,007,007, Cl. 364-574.000
Vaterkowski, Jean-Louis *See*—
Besson, Raymond; Delaite, Richard; Renard, Georges; Valentin, Jean-Pascal; and Vaterkowski, Jean-Louis, 5,006,750, Cl. 310-348.000
Vaughn, Walter L., McKeand, Thomas J., Jr., and Patton, Robert T., to Dow Chemical Company, The. Biocidal fluid filters. 5,006,267, Cl. 210-755.000.
VDO Adolf Schindling AG *See*—
Mann, Arnold, 5,005,546, Cl. 123-339.000
Veale, Charles J. Mobile-cervical extension and supporting apparatus. 5,005,563, Cl. 128-75.000
Veatch, Fred C., and Keller, Alfred E., to Conoco Inc. Regeneration of acidic cationic exchange resin used in the reactivation of spent alkanolamine. 5,006,258, Cl. 210-677.000
Veber, Daniel F *See*—
Greenlee, William J.; Veber, Daniel F.; and Williams, Peter D., 5,006,511, Cl. 514-19.000
Veit Transpo GmbH. *See*—
Gonser, Jochen, 5,005,690, Cl. 198-350.000
Velcro Industries B.V. *See*—
Kennedy, William J., Leach, Peter E., and Grogan, Larry N., 5,005,242, Cl. 5-481.000
Venema, Bernardus G. J. L. *See*—
Kemkers, Pieter; Van Roosmalen, Johannes H. M.; and Venema, Bernardus G. J. L., 5,005,338, Cl. 53-494.000.
Vercaemer, Claude *See*—
Jasinski, Raymond; Fletcher, Philip; and Vercaemer, Claude, 5,005,406, Cl. 73-153.000.
Verdon, Eric *See*—
Demazeau, Gerard; Martel, Olivier; Devalette, Michel; and Verdon, Eric, 5,006,318, Cl. 423-21.100
Verla-Pharm Arzneimittelfabrik Apotheker H.J.V. Ehrlich GmbH & Co. KG *See*—
Helbig, Joachim, and Classen, Hans G., 5,006,516, Cl. 514-163.000
Verrico, Marsha K., to Nabisco Brands, Inc. Method and apparatus for spraying snow-like frosting onto foodstuff particles. 5,005,514, Cl. 118-16.000
Vetter, Hans; Ohlschlager, Hans; Odenwalder, Heinrich; Morcher, Bernhard; Sommer, Friedhelm; and Rosenhahn, Lothar, to Bayer Aktiengesellschaft. Photographic recording material. 5,006,457, Cl. 430-613.000

Vetter, Ronald F *See*—
Pracchia, Louis; Vetter, Ronald F.; and Rosenlof, Darwin, 5,006,429, Cl. 429-112.000
Vick, Kenneth W., Webb, J. C., and Litzkow, Carl A., to United States of America, Agriculture. Insect detection using a pitfall probe trap having vibration detection. 5,005,416, Cl. 73-587.000
Vickers PLC *See*—
Cooper, Graham P., and Jones, Reginald T., 5,006,442, Cl. 430-168.000.
Victor company of Japan, Ltd *See*—
Nishio, Akira; Nakamura, Masato; and Mochizuki, Akihiro, 5,006,745, Cl. 310-177.000
Shikunami, Juichi, Itonaga, Makoto; Kayanuma, Kanji; Kai, Masakatsu, and Nakamura, Nobuaki, 5,006,703, Cl. 250-231.130.
Takanashi, Itsuo, Tanaka, Hedeshi, Kato, Shigeru; Osada, Naomi; and Ichito, Toshikatsu, 5,005,998, Cl. 400-208.000
Takanashi, Itsuo, Nakagaki, Shintaro; and Shinonaga, Hirohiko, 5,006,935, Cl. 358-300.000
Vielhaber, Robert G *See*—
Sharaby, Zaev; and Vielhaber, Robert G., 5,006,607, Cl. 525-356.000.
Villalon, Claudine, to U.S. Philips Corporation. Method of manufacturing an intergrated circuit including steps for forming interconnections between patterns formed at different levels. 5,006,485, Cl. 437-195.000
Villis, Michelle. *See*—
Gaiatto, Daniele; Menguzzato, Gianni; and Villis, Michelle, 5,005,220, Cl. 2-421.000.
Vines, Arthur D., Schonfeld, Frederick A., and Espat, Ricardo, to Sparton Corporation. Addressable transducer with improved response signal processing. 5,006,841, Cl. 340-825.070.
Vingerhoets, Marcel *See*—
Ludwig, Karl; van Raemdonck, Edwin; Stutzel, Klaus; and Vingerhoets, Marcel, 5,006,654, Cl. 544-219.000
Virkar, Anil V., to Gas Research Institute. Stabilized bismuth oxide. 5,006,494, Cl. 501-152.000
Virnig, Daniel R., Jackson, Douglas O.; and Blechen, Frederick C., to Boeing Company, The. Automatic throttle controller for aircraft with intermixed engines. 5,006,993, Cl. 364-431.010.
Virr, Michael J., to Tampella Keeler Inc. Bubbling fluid bed boiler with recycle. 5,005,528, Cl. 122-4.00D
Visionex *See*—
Gin, Jerry; and Wong, Vernon G., 5,006,310, Cl. 422-56.000.
VIX Design Products, Inc. *See*—
Haugen, Ronald E.; and Murphy, David T., 5,005,892, Cl. 296-3.000.
Vogel Viola, and Mobius, Dietmar, to Hoechst Aktiengesellschaft. Film comprising at least one unimolecular layer. 5,006,410, Cl. 428-411.100.
Vogele, Richard. Device for the cutting of plates of soft material. 5,005,289, Cl. 30-140.000
Vogelzang, Steven J. Wood burning apparatus. 5,005,555, Cl. 126-60.000.
Vogl, Allen W., Poe, Steven C.; MacNeill, John H.; and Buron, Douglas J., to International Teleservice Corporation. Coin fraud prevention unit and modular configurations for pay telephone stations. 5,007,079, Cl. 379-145.000
Vogler, Erwin A *See*—
Liczwek, Deborah L., and Vogler, Erwin A., 5,006,259, Cl. 210-692.000
Vogt, Hartmut: *See*—
Hamann, Jens; and Vogt, Hartmut, 5,006,775, Cl. 318-723.000.
Volland, Michel, Grandvallet, Gilles; and Fourneaux, Roger, to S.A. Saurer Diederichs. Pneumatic removal of defective weft filament. 5,005,609, Cl. 139-116.200
von Allworden, Wilhelm, to Greenland Gmph & Co. Round baler. 5,005,696, Cl. 206-83.500.
von der Heide, Johann: *See*—
Elsasser, Dieter; and von der Heide, Johann, 5,006,943, Cl. 360-99.080.
von der Heyde, Richard; and Becker, Erich, to KNF Newberger GmbH. Peristaltic pump. 5,006,049, Cl. 417-476.000.
Von Hayn, Holger *See*—
Reinartz, Hans-Dieter; Steffes, Helmut; Von Hayn, Holger; and Meier, Thomas, 5,005,350, Cl. 60-562.000.
Votava, Paul, III; and Mojonnier, Daniel K. Dual-action aquarium filter. 5,006,230, Cl. 210-94.000
Vrzalik, John H., to Kinetics Concepts, Inc. Patient support apparatus. 5,005,240, Cl. 5-453.000.
Vuillaume, Denis: *See*—
Muggeo, Alain; and Vuillaume, Denis, 5,005,756, Cl. 228-127.000
Vulcano, Terrance E. Keyboard with one hand character key array and one hand mapping key array. 5,006,001, Cl. 400-486.000.
W.A. Technology Limited. *See*—
Wilson, Colin J., 5,006,814, Cl. 330-107.000.
Waago, Harald. Use of human growth hormone in treating topical ulcers. 5,006,509, Cl. 514-12.000.
Wacker-Chemie GmbH: *See*—
Wolfer, Dietrich; and Marsch, Wilhelm, 5,006,372, Cl. 427-387.000.
Wada, Hiroyuki: *See*—
Kaneda, Naoya; Wada, Hiroyuki; Hirasawa, Masahide; and Suda, Hirofumi, 5,005,956, Cl. 350-429.000.
Wada, Kou *See*—
Yoshizawa, Masahiro, Kikuchi, Akira; Wada, Kou; Fujinami, Minpei; and Shimazu, Nobuo, 5,006,795, Cl. 324-158.00R
WaferScale Integration Inc *See*—
Kazerounian, Reza; Ali, Syed; and Eitan, Boaz, 5,006,974, Cl. 363-60.000.
Wagner, Walter R *See*—
Anderson, Thomas A.; Kalar, Richard G.; Markfelt, Reinhold S., and Wagner, Walter R., 5,006,228, Cl. 209-365.300
Wahle, Bernd, Herold, Claus-Peter, Zoellner, Wolfgang, Schieferstein, Ludwig, and Oberkobusch, Dons, to Henkel Kommanditgesellschaft auf Aktien. Copolymers of long chain alkyl acrylates with N-containing olefins and their use as flow improvers for crude oils. 5,006,621, Cl. 526-262.000.
Wakabayashi, Juichi: *See*—
Mizuno, Toshiya, Teramoto, Yoshikichi; Saito, Takeshi, and Wakabayashi, Juichi, 5,006,605, Cl. 525-189.000
Wakayama, Shigeru, and Miura, Akira, to Kabushiki Kaisha Toshiba. Method of forming thin organic films. 5,006,374, Cl. 427-430.100
Wako Sangyo Kabushiki Kaisha. *See*—
Sato, Mikio; and Yamaguchi, Tsuneo, 5,006,242, Cl. 210-232.000
Waldorf Corporation *See*—
Dutcher, Daniel P., 5,005,701, Cl. 206-491.000.
Walker, Delroy: *See*—
Egermeier, John C., Ellzey, Janet, and Walker, Delroy, 5,005,519, Cl. 118-722.000
Walker, Donald L.: *See*—
Draffen, Dale, Dunning, William E.; McGregor, Larry D., Walker, Donald L., and Sisk, Harold R., 5,005,983, Cl. 366-340.000
Walker, Frank J., Jr: *See*—
Walker, Frank J., Sr.; and Walker, Frank J., Jr., 5,006,044, Cl. 417-12.000.
Walker, Frank J., Sr.; and Walker, Frank J., Jr. Method and system for controlling a mechanical pump to monitor and optimize both reservoir and equipment performance. 5,006,044, Cl. 417-12.000
Wall, Robert G., Friedmann, Francois; and Current, Steven P., to Chevron Research Company. Steam enhanced oil recovery method using branched alkyl aromatic sulfonates. 5,005,644, Cl. 166-272.000
Wallace Computer Services, Inc *See*—
Schmidt, Eric R., 5,006,191, Cl. 156-268.000
Wallace, John: *See*—
Day, Richard A.; and Wallace, John, 5,006,661, Cl. 548-227.000
Wallick, Claude R., Jr., and Schmitt, Thomas J., to Emerson Electric Co. Method of manfacturing a foldable ladder structure. 5,005,280, Cl. 29-434.000
Walsh, Michael J.: *See*—
Kelleher, Barbara J.; Walsh, Michael J., and Cone, Richard E., 5,005,234, Cl. 5-94.000.
Walt, David R.: *See*—
Raemer, Daniel B.; Walt, David R.; and Munkholm, Christianne, 5,005,572, Cl. 128-207.140
Walter, Wilhelm: *See*—
Dreschmann, Peter, and Walter, Wilhelm, 5,005,992, Cl. 384-484.000.
Walters, Donald, to University of Florida. Spectacle frames. 5,005,965, Cl. 351-119.000.
Walton, Jesse D., Jr *See*—
Logan, Kathryn V.; and Walton, Jesse D., Jr., 5,006,490, Cl. 501-155.000
Wang Laboratories, Inc *See*—
Cooper, James L., 5,006,836, Cl. 340-710.000
Wang, Mao-Hsiung. Steering wheel lock. 5,005,389, Cl. 70-209.000.
Wang, Teng-Yun *See*—
Lo, Tzung-I.; and Wang, Teng-Yun, 5,005,384, Cl. 70-25.000
Ward, William E., and Gumm, Jack R., Jr., to Boeing Company, The. Method and apparatus for the design and construction of composite parts. 5,006,990, Cl. 364-768.000
Warnauth, Ivan J., II, and Moeglin, Steven J., to Goodyear Tire & Rubber Company, The. Airspring end member and airspring assembly. 5,005,808, Cl. 267-64.270
Warner-Lambert Company *See*—
Kumar, Lori D.; and Schobel, Alexander M., 5,006,571, Cl. 523-120.000
Warren, Keith O., to Litton Systems, Inc. Stackable multilayer substrate for mounting integrated circuits. 5,006,923, Cl. 357-80.000
Wash, Michael L., to Eastman Kodak Company. Implicit mid roll interrupt protection code for camera using dedicated magnetic tracks on film. 5,006,873, Cl. 354-106.000.
Washizu, Takehiro; and Nagamatsu, Tsutomu, to Yamaha Hatsudoki Kabushiki Kaisha. Intake system for automotive engine. 5,005,534, Cl. 123-52.00M.
Washizu, Takehiro; and Nagamatsu, Tsutomu, to Yamaha Hatsudoki Kabushiki Kaisha. Ventilation system for automotive engine. 5,005,553, Cl. 123-572.000.
Waste Management of North America, Inc *See*—
Smith, Fred T., and Smith, Fred P., 5,006,030, Cl. 414-406.000
Watanabe, Hiroaki. *See*—
Maruyama, Haruhisa; Ishiguro, Ken-ichi; Watanabe, Hiroaki, and Yagisawa, Osamu, 5,006,058, Cl. 425-556.000.

Westphal, Dennis; and Piles, Jonathan, to CertainTeed Corporation. Glide pad for sliding windows, doors and the like. 316,032, 4-9-91, Cl. D8-400.000.
Westvaco Corporation: *See*—
Kea, John E., 316,037, Cl. D9-425.000.
Whitfield, Oliver J. Wood stove door. 316,141, 4-9-91, Cl. D23-347.000.
Whitley, Warwick M., II, to Attwood Corporation. Support base for boat light pole. 316,159, 4-9-91, Cl. D26-142.000.
Wieman, Mark: *See*—
Wieman, Martha L.; and Wieman, Mark, 316,059, Cl. D11-158.000.
Wieman, Martha L.; and Wieman, Mark. Lawn sculpture. 316,059, 4-9-91, Cl. D11-158.000.
Windorski, David C., to Minnesota Mining and Manufacturing Company. Notepaper dispenser. 316,112, 4-9-91, Cl. D19-86.000.

Wischhusen, Michael L., to Michelin Recherche et Technique. Tire. 316,066, 4-9-91, Cl. D12-143.000
Yamada, Toshiharu, and Kobayashi, Kunihiko, to Yamaha Hatsudoki Kabushika Kaisha. Sailing craft. 316,074, 4-9-91, Cl. D12-303.000
Yamaha Hatsudoki Kabushika Kaisha. *See*—
Yamada, Toshiharu, and Kobayashi, Kunihiko, 316,074, Cl. D12-303.000
Yamamori, Eiji, to Sony Corporation. Adaptor for an 8 cm compact disk. 316,088, 4-9-91, Cl. D14-126.000
Yamategi, Katsumi, to Sony Corporation. Hand held copying machine. 316,106, 4-9-91, Cl. D18-36.000
Yamazaki, Takashi. *See*—
Fushiya, Fusao, Yamazaki, Takashi, and Saito, Mikio, 316,020, Cl. D8-61.000
Yazaki Corporation. *See*—
Inaba, Shigemitsu, 316,080, Cl. D13-146.000
Takenouchi, Kenji, Makita, Toshihiko, and Norizuki, Teruhisa, 316,077, Cl. D13-133.000
Tsubokura, Shizuo, Hoshino, Kunio, and Takayanagi, Itsuo, 316,075, Cl. D13-123.000
Tsubokura, Shizuo, Hoshino, Kunio, and Takayanagi, Itsuo, 316,081, Cl. D13-147.000
Yocum, Roderick E. Trailer hitch cover. 316,069, 4-9-91, Cl. D12-162.000.
Young, H. Gerald. *See*—
Petralia, Salvatore, and Young, H. Gerald, 316,167, Cl. D32-22.000
Zanetti, Joseph. *See*—
DiVito, Fred, Beal, Christopher; and Zanetti, Joseph, 316,139, Cl. D23-303.000

LIST OF PLANT PATENTEES

Arizona Technology Development Corporation. *See*—
McDaniel, Robert G., 7,495, Cl. 74.000
Beimel, Stephen H.. *See*—
Egger, Janet N.; and Beimel, Stephen H., 7,493, Cl. 68.000
Bell, David J. D.. *See*—
Bell, Henry F. D.; Bell, Margaret A.; and Bell, David J. D., 7,490, Cl. 30.000
Bell, Henry F. D.; Bell, Margaret A.; and Bell, David J. D. Macadamia named "Hidden Valley A4", 7,490, 4-9-91, Cl. 30.000
Bell, Margaret A.. *See*—
Bell, Henry F. D.; Bell, Margaret A.; and Bell, David J. D., 7,490, Cl. 30.000
Daou, Arthur J.; and Daou, Suzanna. Arthur cherimoya tree. 7,491, 4-9-91, Cl. 33.000
Daou, Suzanna. *See*—
Daou, Arthur J.; and Daou, Suzanna, 7,491, Cl. 33.000
Egger, Janet N.; and Beimel, Stephen H., to Mitsuwa Nursery, Inc. Gazania plant called *Gazania rigens* 'Moorpark Orange'. 7,493, 4-9-91, Cl. 68.000
Fiala, John L., to J. Frank Schmidt & Son Co. Flowering crab apple tree 'Sinai Fire'. 7,492, 4-9-91, Cl. 34.000
J. Frank Schmidt & Son Co.. *See*—
Fiala, John L., 7,492, Cl. 34.000
Klemm, Siegfried, to Klemm & Sohn. Geranium plant named Breneso. 7,494, 4-9-91, Cl. 68.000
Klemm & Sohn. *See*—
Klemm, Siegfried, 7,494, Cl. 68.000
McDaniel, Robert G., to Arizona Technology Development Corporation. Pyrethrum plane named Arizona. 7,495, 4-9-91, Cl. 74.000
Mitsuwa Nursery, Inc.. *See*—
Egger, Janet N.; and Beimel, Stephen H., 7,493, Cl. 68.000

CLASSIFICATION OF PATENTS

ISSUED APRIL 9, 1991

NOTE.—First number, class; second number, subclass; third number, patent number

PATENT AND TRADEMARK OFFICE NOTICES

Patent Cooperation Treaty (PCT) Information

For information concerning the PCT member countries see the notice appearing in the *Official Gazette* at 1120 O.G. 54 on Nov. 27, 1990.

For use of the European Patent Office as an International Searching Authority for international applications filed in the United States Receiving Office, see the notice appearing in the *Official Gazette* at 1022 O.G. 52 on Sept. 28, 1982.

For use of the European Patent Office as an International Preliminary Examining Authority for international applications filed in the United States Receiving Office, see the notices appearing in the *Official Gazette* at 1080 O.G. 2 on July 7, 1987 and at 1091 O.G. 2 on June 7, 1988. There is no longer a limit on the number of such international applications accepted for international preliminary examination by the European Patent Office; see the notice appearing at 1116 O.G. 32, on July 17,1990.

The search fee of the European Patent Office was changed due to a difference in the amount of the fee in German Marks and the exchange rate of the U.S. dollar in relation to the German Mark as of Jan. 3, 1991, and was announced in the *Official Gazette* at 1122 O.G. 564 on Jan 1, 1991.

International fees were changed on March 1, 1991 due to a difference in the exchange rate of the U.S. dollar in relation to the Swiss Franc and were announced in the *Official Gazette* at 1122 O.G. 629 on Jan. 22, 1991.

Certain domestic PCT fees and charges for International Search and Preliminary Examination have been changed effective Apr. 17, 1989 and were announced in the *Official Gazette* at 1100 O.G. 24 on Mar. 7, 1989.

The current schedule of PCT fees (in U.S. dollars) is as follows:

Transmittal fee:	170.00
Search Fee	
U.S. Patent and Trademark Office (USPTO) as International Searching Authority (ISA)	
—No corresponding prior U.S. national application filed	550.00
—Corresponding prior U.S. national application filed	380.00
—Supplemental search fee, per additional invention	150.00
European Patent Office as ISA	1492.00
Preliminary examination fee	
USPTO as International Preliminary Examining Authority (IPEA)	
—Search fee paid to USPTO as ISA	400.00
—Additional examination fee, per additional invention	130.00
—ISA not the USPTO	600.00
—Additional examination fee, per additional invention	200.00
International fees	
Basic fee	559.00
Basic Supplemental fee (for each page over 30)	11.00
Designation fee per country or region for the first 10 national or regional offices	135.00
Designation fee for 11th and subsequent designations	No Charge
Handling fee	171.00

U.S. National Stage fees	Small Entity	Regular
USPTO was IPEA	165.00	330.00
USPTO was ISA but not IPEA	185.00	370.00
USPTO was neither ISA nor IPEA	250.00	500.00
USPTO was IPEA and all claims presented satisfied provisions of PCT Article 33(2) to (4)	25.00	50.00
—For each independent claim in excess of 3	18.00	36.00
—For each claim in excess of 20	6.00	12.00
—For each application containing a multiple dependent claim	60.00	120.00
—Surcharge for filing national fee or oath or declaration after the time limit applicable under PCT Article 22 or 39(1)	60.00	120.00
—Processing fee for filing English translation after the time limit applicable under PCT Article 22 or 39(1)	30.00	30.00

Dec. 21, 1990

HARRY F. MANBECK, Jr.
Assistant Secretary and Commissioner of Patents and Trademarks.

Notice of Maintenance Fees Payable

Title 37, Code of Federal Regulations, Section 1.362(d), effective Nov. 1, 1984, provides that maintenance fees may be paid without surcharge for a six-month period beginning 3, 7, and 11 years after the date of issue of patents based on application filed on or after Dec. 12, 1980. An additional six-month grace period is provided by 35 U.S.C. 41(b) and 37 CFR 1.362(e) for payment of the maintenance fee with the surcharge set forth in 37 CFR 1.20(k) or (l), as amended effective Apr. 17, 1989. If the maintenance fee is not paid in a patent requiring such payment the patent will expire on the 4th, 8th or 12th anniversary of the patent.

Attention is drawn to the patents which were issued on April 12, 1988 for which maintenance fees due at 3 years and six months may now be paid. The patents have patent numbers within the following ranges:

Utility Patents 4,736,466 through 4,737,993
Reissue Patents based on the above identified patents.

Attention is drawn to the patents which were issued on April 10, 1984 for which maintenance fees due at 7 years and six months may now be paid. The patents have patent numbers within the following ranges:

Utility Patents 4,441,211 through 4,442,550
Reissue Patents based on the above identified patents.

No maintenance fees are required for design or plant patents.

Payments of maintenance fees in patents should be directed to "Commissioner of Patents and Trademarks, Box M. Fee, Washington, D.C. 20231."

The current amounts of the maintenance fees due at 3 years and six months and seven years and six months are set forth in 37 CFR 1.20(e), and (f), as amended Nov. 5, 1990, which are reproduced below:

37 CFR § 1.20 Post-issuance fees and surcharges

"(e) For maintaining an original or reissue patent, except a design or plant patent, based on an application filed on or after after Dec. 12, 1980 and before Aug. 27, 1982, in force beyond 4 years; the fee is due by three years and six months after the original grant.....$245.00

"(f) For maintaining an original or reissue patent, except a design or plant patent, based on an application filed on or after Dec. 12, 1980 and before Aug. 27, 1982, in force beyond 8 years; the fee is due by seven years and six months after the original grant.....$495.00"

"(h) For maintaining an original or reissue patent except a design or plant patent, based on an application filed on or after Aug. 27,1982, in force beyond 4 years; the fee is due by three years and six months after the original grant:

By a small entity (§1.9(f)).....$415.00
By other than a small entity.....$850.00"

"(i) For maintaining an original or reissue patent, except a design or plant patent, based on an application filed on or after Aug. 27, 1982, in force beyond 8 years; the fee is due by seven years and six months after the original grant:

By a small entity (§1.9(f)).....$835.00
By other than a small enttity.....$1670.00"

The amounts of the surcharges for paying the maintenance fee during the grace period or after the expiration of the patent are set forth in 37 CFR 1.20(k), (l) and (m), which are reproduced below:

"(k) Surcharge for paying a maintenance fee during the 6-month grace period following the expiration of three years and six months , seven years and six months, and eleven years and six months after the date of the original grant of a patent based on an application filed on or after Dec. 12, 1980 and before Aug. 27,1982.....$120.00"

"(l) Surcharge for paying a maintenance fee during the 6-month grace period following the expiration of three years and six months, seven years and six months, and eleven years and six months after the date of the original grant of a patent based on an application filed on or after Aug. 27, 1982:

By a small entity(§1.9(f)).....$60.00
By other than a small entity.....$120.00"

"(m) Surcharge for accepting a maintenance fee after expiration of a patent for non-timely payment of a maintenance fee where the delay is shown to the satisfaction of the Commissioner to have been unavoidable.....$550.00"

Notice of Expiration of Patents Due to Failure to Pay Maintenance Fees

35 U.S.C. 41 and 37 CFR 1.362(g) provide that if the required maintenance fee and any applicable surcharge are not paid in a patent requiring such payment, the patent will expire at the end of the 4th, 8th, or 12th anniversary of the grant of the patent depending on the first maintenance fee which was not paid.

According to the records of the Office, the patents listed below have expired due to failure to pay the required maintenance fee and any applicable surcharge.

REISSUE APPLICATIONS FILED

Notice under 37 CFR 1.11(b). The reissue applications listed below are open to inspection by the general public in theindicated Examining Groups and copies may be obtained by paying the fee therefor (37 CFR 1.21(b).

4,715,620, Re. S. N. 07/662,730, Filed Mar. 1, 1991, Cl. 282/9, MANIFOLD FORM ASSEMBLY, Gary J. Thompson, Owner of Record: *Inventor*, Attorney or Agent: Andrew S. McConnel, Ex. Gp.: 326

4,761,058, Re. S. N. 07/562,108, Filed Aug. 2, 1990, Cl. 350/331T, BIASING LIQUID CRYSTAL DISPLAYS HAVING CAPACITORS AND TRANSISTORS, Yukitoshi Okubo, et al., Owner of Record: *Inventor*, Attorney or Agent: Steven E. Warner, Ex. Gp.: 254

4,761,140, Re. S. N. 07/559,689, Filed July 26, 1990, Cl. 439/621, FUSE BLOCK WITH REJECTION FEATURE, Gayle L. Sappingotn, Owner of Record: *Cooper Industries, Inc., Houston, Tex.*, Attorney or Agent: David A. Rose, Ex. Gp.: 322

4,802,444, Re. S. N. 07/638,812, Filed Jan. 8, 1991, Cl. 119/29, THERAPEUTIC PET TOY, Joseph P. Markham, et al., Owner of Record: *Bounce, Inc., Lakewood, Colo.*, Attorney or Agent: Gary D. Fields, Ex. Gp.: 333

4,809,422, Re. S. N. 07/665,423, Filed Mar. 6, 1991, Cl. 29/568, MACHINE TOOL WITH INDEX MEANS, Koichiro Kitamura, Owner of Record: *Kitamura Machinery Co., Ltd., Takaoka-Si, Japan*, Attorney or Agent: Jean D. Kuelper, Ex. Gp.: 322

4,913,998, Re. S. N. 07/664,535, Filed Mar. 4, 1991, Cl. 430/96, SILVER-BASED ELECTROSTATIC PRINTING MASTER, Allan Cairncross, et al., Owner of Record: *E. I. du Pont de Nemours and Company, Wilmington, De.*, Attorney or Agent: Alason G. Bowen, Ex. Gp.: 156

4,952,382, Re. S. N. 07/634,106, Filed Dec. 26, 1990, Cl. 423/244, PROCESS FOR REMOVING SULFUR OXIDES WITH AN ABSORBENT WHICH CONTAIN AN ANIONIC CLAY, Imanuel H. Vanbroekhoven, Owner of Record: *Akzo N.V., BM Arnhem, Netherlands*, Attorney or Agent: William P. Berridge, Ex. Gp.: 113

REQUESTS FOR REEXAMINATION FILED

Notice under 37 CFR 1.11(c). The requests for reexamination listed below are open to inspection by the general public in the indicated Examining Groups. Copies of the requests and related papers may be obtained by paying the fee therefor established in the Rules (37 CFR 1.19(a).

In the event correspondence to the patent owner is not received, this notice will be considered to be constructive notice to the patent owner and reexamination will proceed (37 CFR 1.248(a)(5) and 1.525(b).

4,554,644, Reexam. No. 90/002,294, Requested Mar. 11, 1991, Cl. 365/154, STATIC RAM CELL, Peter C. Chen, et al., Owner of Record: *Fairchild Camera and Instrument Corp., (A. K. A. Fairchild Semiconductor Corp.,) Mountain View, Calif.*, Attorney or Agent: Micheal J. Pollock, Limbach, Limbach & Sutton, San Francisco, Calif., Ex. Gp.: 233, Requester: Owner

4,573,477, Reexam. No. 90/002,290, Requested Feb. 28, 1991, Cl. 128/663, ULTRASONIC DIAGNOSTIC APPARATUS, Koroku Namekawa, et al., Owner of Record: *Aloka Co., Ltd., Tokyo, Japan*, Attorney or Agent: William L. Androlia, Koda & Androlia, Los Angeles, Calif., Ex. Gp.: 335, Requester: Owner

4,641,668, Reexam. No. 90/002,291, Requested Feb. 28, 1991, Cl. 128/661, ULTRASONIC BLOOD FLOW IMAGING METHOD AND APPARATUS, Koroku Namekawa, Owner of Record: *Aloka Co., Tokyo, Japan*, Attorney or Agent: William L. Androlia, Koda & Androlia, Los Angeles, Calif., Ex. Gp.: 335, Requester: Owner

4,679,126, Reexam. No. 90/002,289, Requested Mar. 01, 1991, Cl. 362/226, MINIATURE LAMP ARRAYS HAVING IMPROVED LAMP RETENTION FEATURES, Robert H. Van Sickler, Owner of Record: *General Electric Corp., Cleveland, Ohio*, Attorney or Agent: John P. McMahon, Cleveland, Ohio, Ex. Gp.: 346, Requester: Owner

4,826,283, Reexam. No. 90/002,292, Requested Mar. 7, 1991, Cl. 350/096.12, LiB_3O_5 CRYSTAL AND ITS NONLINEAR OPTICAL DEVICES, Chen Chuangtian, et al., Owner of Record: *Fujian Institute of Research on the Structure of Matter, Chinese Academy of Sciences, Fujian, China*, Attorney or Agent: Armstrong, Nikado, Marmelstein & Kubovcik, Washington, D.C., Ex. Gp.: 251, Requester: Owner

4,836,218, Reexam. No. 90/002,286, Requested Feb. 25, 1991, Cl. 128/773, METHOD AND APPARATUS FOR THE ACOUSTIC DETECTION AND ANALYSIS OF JOINT DISORDERS, Thomas Gay, et al., Owner of Record: *Arthroteck, Inc., Hartford, Conn.*, Attorney or Agent: Fishman, Dionne & Cantor, Windsor, Conn., Ex. Gp.: 335, Requester: Owner

4,838,552, Reexam. No. 90/002,293, Requested Mar. 8, 1991, Cl. 273/138A, MULTILINE SLOT MACHINE, Takashi Hagiwara, Owner of Record: *Sigma Enterprises, Inc., Tokyo, Japan*, Attorney or Agent: Brian D. Ogonowski, Skjerven, Morrill, MacPherson, et al., San Jose, Calif., Ex. Gp.: 334, Requester: Owner

4,904,922, Reexam. No. 90/002,287, Requested Feb. 27, 1991, Cl. 323/316, APPARATUS FOR CONVERTING BETWEEN DIGITAL AND ANALOG VALUES, Joseph H. Collies, Owner of Record: *Brooktree Corp., San Diego, Calif.*, Attorney or Agent: Roston & Schwartz, Los Angeles, Calif., Ex. Gp.: 212, Requester: Fliesler, Dubb, Meyer & Lovejoy, San Francisco, Calif.

Service by Publication

A petition to cancel the registrations identified below having been filed, and the notice of such proceeding sent by certified mail to registrants at the last known address having been returned by the Postal Service as undeliverable, notice is hereby given that unless the registrant listed herein, their assigns or legal representatives shall enter an appearance within thirty days from the date of this publication, the cancellation will be proceeded with as in the case of default.

K.W.C., Inc., Beachwood, Ohio, Reg. No. 1,150,436, for the mark "THE BEAR NECESSITIES", Canc. No. 18,852.

No-Glug Jug Corp., Jacksonville, Fla., Reg. No. 764,868, for the mark "NO-GLUG" (stylized), Canc. No. 19,142.

Lakeside Industries, Inc., West Hartford, Conn., Reg. No. 988,835, for the mark "SKIL-BALL" (stylized), Canc. No. 19,219.

Hussein Kabil, dba Green Grove Citrus, McAllen, Tex., Reg. No. 1,060,458, for the mark "TOPPER" and design, Canc. No. 19,270.

Hussein Kabil, dba Green Grove Citrus, McAllen, Tex., Reg. No. 1,082,817, for the mark "SUPREME" design, Canc. No. 19,271.

SPECIAL BOXES FOR MAIL

Special PTO mail box numbers should be used to allow forwarding of particular types of mail to the appropriate areas as quickly as possible. Such mail is forwarded directly to the appropriate area without being opened. Only the specified type of document should be placed in an envelope addressed to one of these boxes. If any documents other than the specified type identified for each box are addressed to that box, they will be delayed in reaching the appropriate area for which they are intended.

The following special boxes should be used only for their specified purpose. Address mail as follows:

Box _____
Commissioner of Patents and Trademarks
Washington, D.C. 20231

Box 3	Mail for the Office of personel for NFC
Box 4	Mail for the Assistant Commissioner for External Affairs and the Office of Legislation and Internal Affairs.
Box 5	"No Fee" mail related to trademarks.
Box 6	Mail for the Office of Procurement
Box 7	Reissue applications for patents involved in litigation and subsequently filed related papers.
Box 8	All papers for the Office of the Solicitor *except* communications relating to *pending litigation*: papers relating to pending litigation shall be mailed only to Office of the Solicitor, P.O. Box 15667, Arlington, Va. 22215
Box 9	Coupon orders for U.S. patent and trademark copies.
Box 10	Orders for certified copies of patent and trademark applications.
Box 11	Electronic Ordering Service (EOS).
Box 12	Contributions to the Examiner Education Program.
Box 13	Mail for the Employee and Labor Relations Division.
Box 14	Invoices directed to the Office of Finance.
Box 15	Mail for the Advisory Commission on Patent Law Reform.
Box 171	Vacancy Announcement Applications.
Box AF	Expedited procedure for processing amendments and other responses after final rejection.
Box Assignment	All assignment documents except those filed with new applications.
Box EEO	Mail for the Office of Equal Employment Programs.
Box FWC	Requests for File Wrapper Continuation Applications (under 37 CFR 1.62)
Box Interference	Communications relating to interferences and applications and patents involved in interference.
Box Issue Fee	All Communications following the receipt of a PTOL-85 "Notice of Allowance and Issue Fee Due," and prior to the issuance of a patent should be addressed to Box Issue Fee, unless advised to the contrary. Assignments should be submitted in a separate envelope and not be sent to Box Issue Fee.
Box ITU	All intent to use documents, excluding the initial application and amendments to allege use.
Box M. Fee	Correspondence related to a patent that is subject to the payment of a maintenance fee.
Box Non-Fee-Amendment	Non-fee amendments to patent applications. (Use Box AF for responses after final rejection).
Box OED	Mail for the Office of Enrollment and Discipline
Box PATENT APPLICATION	New patent application and associated papers and fees.
Box TRADEMARK	New trademark application and associated papers and APPLICATION fees.
Box Pat. Ext.	Applications for patent term extension.
Box PCT	Mail related to applications filed under the Patent Cooperation Treaty.
Box Reexam	Requests for Reexamination for *original* request papers *only*
Box Sequence	Submission of diskette for biotechnical application.
Box SN	For fee and petitions under 37 CFR 1.182 to obtain date received and/or serial number for patent applications *prior* to the Office's standard notification (return postcard or the official "Filing Receipt," "Notice to File Missing Parts," or "Notice of Incomplete Application").

Reference Collections of U.S. Patents Available for Public Use in Patent Depository Libraries

The following libraries, designated as Patent Depository Libraries (PDLs), receive current issues of U.S. Patents and maintain collections of earlier-issued patents. The scope of these collections varies from library to libary, ranging from patents of only recent years to all or most of the patents issued since 1790.

These patent collections, which are organized in patent number sequence, are available for use by the public free of charge. Each of the PDLs, in addition, offers supplemental reference publications of the U.S. Patent Classification System, including the *Manual of Classification, Index to the U.S. Patent Classification, Classification Definitions*, and provides technical staff assistance in their use to aid the public, in gaining effctive access to information contained in patents. CASSIS (Classification And Search Support Information System), which provides direct, on-line access to Patent and Trademark Office data, is available at all PDLs. Facilities for making paper copies of patents from either microfilm or paper collections are generally provided for a fee.

Since there are variations in the scope of patent collections among the PDLs and in their hours of service to the public, anyone contemplating use of the patents at a particular library is urged to contact that library, in advance, about its collection and hours in order to avert possible inconvenience.

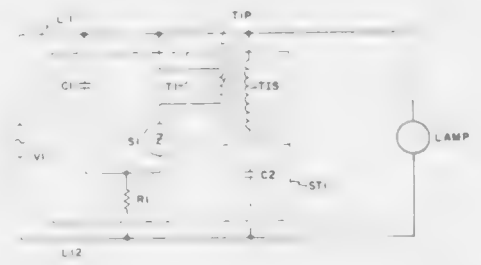
STARTER CIRCUIT FOR GASEOUS DISCHARGE LAMP

Gregory L. Sodini, Memphis, Tenn., assignor to Fl Industries, Livingston, N.J.



Reexamination Request No. 90/001,845, Sep. 19, 1989.

Reexamination Certificate for Patent No. 4,480,214, issued Oct. 30, 1984, Ser. No. 369,262, Apr. 16, 1982.

Reexamination Certificate B1 4,480,214, issued Jan. 31, 1989.

Int. Cl.[4] **H05B** *41/14*

U.S. Cl. 315—290

AS A RESULT OF REEXAMINATION, IT HAS BEEN DETERMINED THAT:

Claims **1–14** are cancelled.

[1. A starter for a gaseous discharge lamp adapted to be powered across the two conductors from an alternating current source, the starter circuit being connected across the two conductors in parallel with said lamp, said starter circuit including a first and second path both in parallel across the source, said first path including a series resistance-capacitance network in which there is a choke coil in series resistance with the resistance of said resistance capacitance network and further with the combination of a voltage threshold sensitive switch and pulse transformer primary in parallel with the capacitance of said network, said switch being adapted to close a circuit to the primary of the transformer when the threshold voltage of the switch is reached by the network, and said second path including the secondary of said pulse transformer coupled across said two conductors for transmitting high voltage, high frequency pulses to said lamp to start said lamp, with said pulse transformer having a turns ratio of approximately one to thirty to generate high voltage, high frequency starting current from said transformer secondary for starting said lamp.]

B1 4,489,022 (1449th)

FORMING COHERENT REFRACTORY MASSES

Pierre Robyn, Nivelles, and Pierre Deschepper, Charleroi, both of Belgium, assignors to Glaverbel SA, Brussels, Belgium

Reexamination Request No. 90/001,894, Nov. 20, 1989.

Reexamination Certificate for Patent No. 4,489,022, issued Dec. 18, 1984, Ser. No. 420,502, Sep. 17, 1982.

Claims priority, application United Kingdom, Nov. 25, 1981, 8135569

Int. Cl.[5] **F27D** *1/16*

U.S. Cl. 264—30

AS A RESULT OF REEXAMINATION, IT HAS BEEN DETERMINED THAT:

The patentability of claims **1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13** and **14** is confirmed.

New claims **15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27** and **28** are added and determined to be patentable.

1. A process of forming a refractory mass comprising burning particles of exothermically oxidisable material having an average grain size less than 50 μm while mixed with particles of incombustible refractory material during projection of the mixture against a surface to form a coherent refractory mass on said surface, said oxidisable material comprises silicon and aluminum, the aluminium being present in an amount not exceeding 9% by weight of the total mixture, and wherein the aluminum and silicon are together present in an amount not exceeding 15% by weight of the total mixture.

B1 4,732,026 (1450th)

METHOD OF LAP WELDING EVENTUAL CAN BLANK CONSISTING OF METAL SHEET OR THE LIKE

Kunikatsu Ban, Mie, Japan, assignor to N.P.W. Technical Laboratories, Mie, Japan

Reexamination Request No. 90/001,872, Oct. 30, 1989.

Reexamination Certificate for Patent No. 4,732,026, issued Mar. 22, 1988, Ser. No. 838,502, Mar. 11, 1986.

Claims priority, application Japan, Mar. 11, 1985, 60-48699

Int. Cl.[4] **B21D** *39/02, 51/28;* **B23K** *11/06*

U.S. Cl. 72—52

AS A RESULT OF REEXAMINATION, IT HAS BEEN DETERMINED THAT:

Claims **1–4** are cancelled.

New claims **6** and **8** (renumbered **6** and **5**) are added and determined to be patentable.

5. A method of lap welding a blank of metal sheet or a covered metal sheet to form a can, comprising the steps of; overlapping both edge portions of the blank to form a lap joint having a width being less than three times the thickness of said blank, simultaneously heating and applying a pressure to the lap joint in an air atmosphere by feeding the lap joint between upper and lower wire electrodes held by upper and lower roller electrodes, respectively, thereby welding the lap joint, said lap joint being electrically heated during application of pressure to said lap joint between upper and lower wire electrodes, each of said upper and lower electrodes having a contact width more than three times width of said lap joint, wherein sequences of thermal press bond sections are formed without the formation of a melting zone in said air atmosphere, each of said thermal press bond sections having a vicker's hardness ranging from 170 to 210, and the center-to-center distance between adjacent thermal press bond sections being set to be in a range of 0.8±0.2 mm.

B1 4,773,812 (1451st)

RECEPTACLE LIFT AND SLIM PROFILE POWER UNIT THEREFOR

Jimmy O. Bayne, and Robert E. Wyman, both of Simpsonville, S.C., assignors to Bayne Machine Works, Inc.

Reexamination Request No. 90/001,993, Apr. 10, 1990.

Reexamination Certificate for Patent No. 4,773,812, issued Sep. 27, 1988, Ser. No. 44,045, Apr. 29, 1987.

Int. Cl.[5] **B65F** *3/02*

U.S. Cl. 414—408

AS A RESULT OF REEXAMINATION, IT HAS BEEN DETERMINED THAT:

The patentability of claims **1–15** is confirmed.

Claims 22–24 are cancelled.

Claims 16, 19–21, and 25 are determined to be patentable as amended.

Claims 17, 18, 26 and 27, dependent on an amended claim, are determined to be patentable.

New claims 28–31 are added and determined to be patentable.

25. A hydraulic rotary motor [as in claim 24 further], comprising:

housing means adapted for the controlled flow of hydraulic fluids therethrough, said housing means being defined by joined upper and lower blockheads, and having hydraulic fluid ports on opposing ends thereof for the complementary flow of fluids therethrough relative said housing means;

piston means received in said housing means for controlled reciprocably movement therein actuated by the passage of hydraulic fluid through said housing means in one direction therethrough at a time, with complementary fluid exit and entry through said opposing end fluid ports, said piston means including a piston rod supporting rack teeth thereon;

pinion gear output shaft means, operatively associated with said housing means and projecting therefrom through an opening defined with a cooperating seal member to prevent escape of any hydraulic fluid from said housing means other than through one of said fluid ports thereof, for being rotatably driven by engagement of pinion teeth thereof with said rack teeth of said piston means;

whereby said output shaft means may be rotated for driving a load by controlled reciprocable movement of said piston means in one direction at a time with said pinion teeth and rack teeth immersed in said hydraulic fluid within said housing means for maintenance-free lubrication thereof;

said housing means includes at least one cylinder for reciprocable receipt of said piston means, with said piston rod thereof being reciprocably movable on approximately one longitudinally bi-sected side of said cylinder, and said output shaft means being receivable in generally the other longitudinally bi-sected side of said cylinder so that engagement of said pinion and rack teeth is provided within said cylinder, whereby hydraulic fluid received in such cylinder provides lubrication for such teeth;

said output shaft means is rotatably mounted transversely to the direction of movement of said piston rod, and includes two opposing ends which project from said housing means, both of which are adapted for rotatably driving a load secured thereto;

a second cylinder substantially parallel with said first cylinder and radially displaced therefrom, such that rack teeth supported on a piston rod reciprocally received in such [second] cylinder also engage said pinion teeth of said output shaft means[.], and

means for supplying hydraulic fluid to said second cylinder so that said rack teeth on said piston rod of said second cylinder and said rack teeth of said piston rod of said first mentioned cylinder jointly drive said output shaft in one direction or the other.

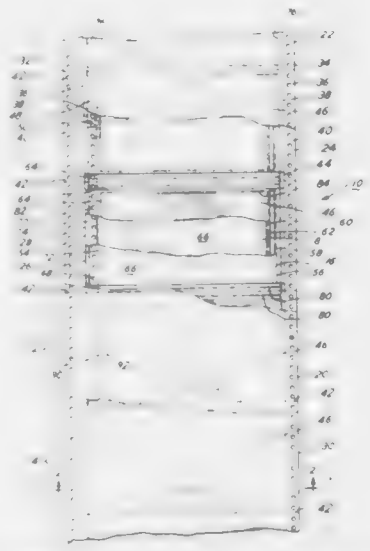
Re. 33,570



CONTINUOUS FILLED ENVELOPE ASSEMBLY WITH NON-MARGINAL SPACED FEED HOLES

Robert E. Ashby, Quakertown, Pa., assignor to Moore Business Forms, Inc., Grand Island, N.Y.

Original No. 4,645,123, dated Feb. 24, 1987, Ser. No. 282,589, Jul. 13, 1981. Application for reissue Dec. 14, 1988, Ser. No. 284,385

Int. Cl.[5] B65D *27/10*

U.S. Cl. 229—69 **12 Claims**

1. A continuous business form assembly constituting a filled envelope assembly and comprising four webs, each of three of the webs being continuous in a longitudinal direction and having two spaced marginal edges in a transverse direction, a marginal row of spaced feed holes extending along a each marginal edge, a line of marginal perforations extending along each marginal row of spaced feed holes, the marginal row of spaced feed holes and marginal perforations thereby defining two continuous, marginal feed strips along the two marginal edges, and each of the three webs further having a line of non-marginal perforations adjacent a first of the lines of marginal perforations and two spaced transverse lines of perforations, the line of non-marginal perforations defining a non-marginal strip adjacent one of the marginal feed strips and the transverse lines of perforations defining a sheet on the web;

the three webs being superimposed with the feed holes, perforations, feed strips, and sheets thereof superimposed and the three webs being attached along the non-marginal strips;

two of the three webs being first and second webs and the other of the three webs being an intermediate third web located between the first and second webs, the intermediate third web defining transversely extending die cuts along the transverse lines of perforations of the intermediate third web between the marginal lines of perforations thereof, the die cuts thereby interrupting the transverse lines of perforations of the intermediate web between the marginal lines of perforations thereof;

the first web being attached to the second web along the transverse lines of perforations and through the die cuts, to form an envelope of the sheets of the first and second webs and an envelope insert of the the third web;

the intermediate third web having a non-marginal row of spaced feed holes extending along the line of non-marginal perforations of the intermediate third web in the non-marginal strip of the intermediate third web, the non-marginal strip of the third web thereby being a non-marginal feed strip;

the continuous business form assembly further comprising a non-continuous fourth web superimposed on the intermediate third web between the intermediate third web and the first web, the non-continuous fourth web having transverse edges in the transverse direction along the die cuts and marginal edges spaced in the transverse direction, one of the marginal edges of the non-continuous fourth web extending along the first of the lines of marginal perforations of the third web, the fourth web further having a line of marginal perforations superimposed upon the line of non-marginal perforations of the third web and a row of spaced feed holes superimposed on the non-marginal row of spaced feed holes of the third web, the non-continuous fourth web being attached along the non-marginal strip of the third web to the third web.

5. A continuous business form assembly constituting a filled envelope assembly and comprising four webs, each of three of the webs being continuous in a longitudinal direction and having two spaced marginal edges in a transverse direction, a marginal row of spaced feed holes extending along each marginal edge, the marginal row of spaced feed holes thereby defining two continuous, marginal feed strips along the two marginal edges, and each of the three webs further having a line of non-marginal perforations and two spaced transverse lines of perforations, the line of non-marginal perforations defining a non-marginal strip adjacent one of the marginal feed strips; and the transverse lines of perforations defining a sheet on the web;

the three webs being superimposed with the feed holes, perforations, feed strips, and sheets thereof superimposed and the three webs being attached along the non-marginal strips;

two of the three webs being first and second webs and the other of the three webs being an intermediate third web located between the first and second webs, the intermediate third web defining transversely extending die cuts along the transverse lines of perforations of the intermediate third web between the marginal feed strips thereof, the die cuts thereby interrupting the transverse lines of perforations of the intermediate web between the marginal feed strips thereof;

the first web being attached to the second web along the transverse lines of perforations and through the die cuts, to form an envelope of the sheets of the first and second webs and an envelope insert of the third web;

the intermediate third web having a non-marginal row of spaced feed holes extending along the line of non-marginal perforations of the intermediate third web in the non-marginal strip of the intermediate third web, the non-marginal strip of the third web thereby being a non-marginal feed strip;

the continuous business form assembly further comprising a non-continuous fourth web superimposed on the intermediate third web between the intermediate third web and the first web, the non-continuous fourth web having transverse edges in the transverse direction along the die cuts and marginal edges spaced in the transverse direction, one of the marginal edges of the non-continuous fourth web extending along the first of the marginal feed strips of the third web, the fourth web further having a line of marginal perforations superimposed upon the line of non-marginal perforations of the third web and a row of spaced feed holes superimposed on the non-marginal row of spaced feed holes of the third web, the non-continuous fourth web being attached along the non-marginal strip of the third web to the third web.

9. A continuous business form assembly including a plurality of filled envelope assemblies, each of which includes at least a pair of first and second outer webs which comprise a plurality of first

envelopes, said first and second outer webs extending continuously in a longitudinal direction, each of said first envelopes being defined in part by transversely extending lines of perforations spaced longitudinally of each other along said first and second webs; said first and second webs having a plurality of feed holes arranged longitudinally along marginal edges of said first and second webs; each of said assemblies further comprising a pair of insert envelope webs and an insert web, wherein at least one of said pair of insert envelope webs and said insert web are laterally abbreviated with respect to said first and second outer webs, and another of said pair of insert envelope webs and said insert web extend across the entire width of the web, and further wherein said pair of insert envelope webs and said insert web each include feed means permitting said insert envelope webs and said insert web to be fed independently of said first and second outer webs.

Re. 33,571

SYSTEM AND METHOD FOR AUTOMATIC TRANSACTION

Kenichi Takahashi, Niigata, Japan, assignor to Hitachi, Ltd., Tokyo, Japan

Original No. 4,692,600, dated Sep. 8, 1987, Ser. No. 736,702, May 22, 1985. Application for reissue Sep. 8, 1989, Ser. No. 404,906

Claims priority, application Japan, Jul. 31, 1984, 59-159060

Int. Cl.[5] G06K *5/00*

U.S. Cl. 235—379 **43 Claims**

11. A system for automatic banking transactions, comprising:

medium reader means for receiving a medium from a customer and for reading data from said medium in which information identifying said customer is recorded;

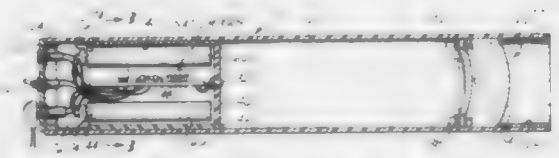
an operation unit provided with at least one combination transaction selection key to input the selection of the combination transaction, and at least one number key to input numerical values by the customer;

display means for displaying instructions and data for operation to the customer;

control means for identifying the customer in response to the information identifying said customer and providing customer banking information;

said control means further performing a first banking transaction based upon said customer banking information and one selection of said combination transaction selection key and thereafter performing a second banking transaction based upon the customer banking information and said selection of the combination transaction selection key with automatic flow from the first banking transaction to the second banking transaction in response to only one reading data from said medium and only one selection of said combination transaction selection key.

Re. 33,572



INVISIBLE LIGHT BEAM PROJECTOR AND NIGHT VISION SYSTEM

Brad E. Meyers, c/o B.E. Meyers Co. Inc., 17525 NE. 67th Ct., Redmond, Wash. 98052

Original No. 4,707,595, dated Nov. 17, 1987, Ser. No. 3,253, Dec. 29, 1986. Continuation of Ser. No. 694,444, Jan. 30, 1985, abandoned. Application for reissue Jul. 13, 1989, Ser. No. 379,271

Int. Cl.[5] G01J *1/00*

U.S. Cl. 250—504 R **46 Claims**

1 An invisible light beam projector, comprising a tubular body having a forward end and a rearward end;

an invisible light beam emitting diode having an emitting lens,

mounting means inside of said tubular body mounting the diode at a location within the body, between the two ends of the body, with the lens of the diode directed towards the forward end of the body;

control circuit means for *causing* the diode [adapted] to be repetitiously charged and discharged, and on each discharge causing the diode to light and transmit a narrow beam of invisible light through the emitting lens towards the forward end of the tubular body, said control circuit means functioning to turn the diode on and off at a rate resulting in the diode being on between about 10–20% of the time and off during the remainder of the time, and when on being powered by a current that is substantially larger than the diode could stand if on continuously, and

projection lens means within the tubular body, forwardly of the diode, of a type which is always in focus in a range between a predetermined minimum distance from the light projector and infinity, said projection lens means being positioned and adapted to receive the narrow beam of invisible light from the diode lens and enlarge and collimate this light into a collimated beam of invisible light in sharp focus, to produce a lighting spot having a sharp and definite edge

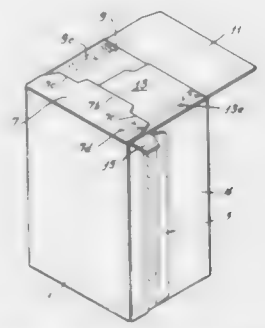
Re. 33,573

FOLDING ICE-CREAM CARTON, CARTON BLANK AND METHOD

Thomas W. Froom, 10 Burncoat Way, Pittsford, N.Y. 14534



Original No. 4,526,563, dated Jul. 2, 1985, Ser. No. 530,367, Sep. 8, 1983. Division of Ser. No. 331,557, Dec. 17, 1981, Pat. No. 4,431,129, which is a division of Ser. No. 158,167, Jun. 10, 1980, Pat. No. 4,328,656, which is a division of Ser. No. 842,747, Oct. 17, 1977, Pat. No. 4,239,115. Application for reissue Mar. 9, 1987, Ser. No. 23,845

Int. Cl.[5] B65B *43/08, 43/26*

U.S. Cl. 493—151 **17 Claims**

1 A method for closing an end of a carton tube formed of front, rear, cover, and bottom panels fastened together into a tube by means of a front cover flap fastened to the front panel, having respectively connected to said panels and said front cover flap, by fold lines, front and rear panel inner end wall-forming flaps, one of which is adapted to overlie the other when they are folded in; a side cover flap having a tuck-in tab projecting from the mid-portion thereof, which side cover flap is adapted, when it is folded in, to overlie the overlying inner end wall-forming flap; a bottom panel flap adapted, when folded in, to overlie the tuck-in tab of the side cover flap; and, a glue-flap extension of the front cover flap adapted, when folded in, to overlie the fold-in side cover flap, which method

comprises folding in one of the inner end wall-forming flaps, folding in the other inner end wall-forming flap so that it overlies the one already folded in, folding in the side cover flap thereover, applying strips of glue along and adjacent the fold lines between the folded-in inner end wall-forming flaps and the panels to which they are connected, the glue strip adjacent the rear panel [being terminated short of the folded-down side cover flap and] being disposed between the tuck-in tab and the rear panel, and the other glue strip extending up over the folded-down side cover flap between the tuck-in tab and the front panel, and then folding the outer end wall-forming flap

and the glue-flap extension into contact with said glue strips and causing them to adhere thereto [without a mandrel].

7,496

MINIATURE ROSE PLANT NAMED 'LUIS DESAMERO'

Cecilia D. Bennett, deceased, late of Chula Vista, Calif., by Susan O'Brien, executrix, assignor to Susan O'Brien, special administrator, Chula Vista, Calif.

Filed Jan. 2, 1990, Ser. No. 460,233
Int. Cl.[5] A01H *5/00*
U.S. Cl. Plt.—8 **1 Claim**

1. A new and distinct variety of miniature rose plant named, 'Luis Desamero' of hardy, dwarf, vigorous growth, well-branched and attractive in appearance, substantially as illustrated and described, characterized by its hybrid tea-form blooms, ranging from near Primrose Yellow to near Mimosa Yellow, with flowers borne usually one to a stem but occasionally in sprays of 3 to 5 or more.

7,497

ALMOND TREE, CRUZ

Irwin H. Bonds, Hilmar, Calif., assignor to Ruben A. Cruz, Modesto, Calif.

Filed Oct. 16, 1989, Ser. No. 422,412
Int. Cl.[5] A01H *5/00*
U.S. Cl. Plt.—30 **1 Claim**

1. A new and distinct variety of almond tree substantially as illustrated and described and which is somewhat similar to the Nonpareil almond tree (believed unpatented) which matures at approximately the same time of the season, but which is distinguished therefrom and characterized principally as to novelty, by producing a crop which is ripe for commercial harvesting and shipment approximately seven to ten days after the Nonpareil variety of almond tree and which further has a longer blooming period than the Nonpareil variety of almond tree, the new variety of almond tree "Cruz" facilitating the pollenization of other almond trees growing in the immediate geographical vicinity thereof.

7,498

HEATHER PLANT NAMED ERICA 'AUGUSTINA'

Bruno L. Imazio, 197 Sunset Beach Rd., Watsonville, Calif. 95076

Filed Aug. 14, 1989, Ser. No. 393,674
Int. Cl.[5] A01H *5/00*
U.S. Cl. Plt.—54 **1 Claim**

1. A new and distinct cultivar of Heather plant named Erica 'Augustina', substantially as herein shown and described characterized particularly as to novelty by its early blooming habit; attractive deep, rich rose-magenta color; and vigorous long stems desirable for cut flowers.

7,499

GERANIUM PLANT NAMED FISPOL

Ingeborg Schumann, Hoehr-Grenzhausen, Fed. Rep. of Germany, assignor to Florfis AG, Binningen, Switzerland

Filed Oct. 25, 1989, Ser. No. 426,564
Int. Cl.[5] A01H *5/00*
U.S. Cl. Plt.—68 **1 Claim**

1. A new and distinct cultivar of geranium plant named Fispol, as illustrated and described.

7,500

CHRYSANTHEMUM PLANT NAMED DESIREE

Cornelis P. VandenBerg, Salinas, Calif., assignor to Yoder Brothers, Inc., Barberton, Ohio

Filed Nov. 14, 1989, Ser. No. 435,820
Int. Cl.[5] A01H *5/00*
U.S. Cl. Plt.—74 **1 Claim**

1. A new and distinct Chrysanthemum plant named Desiree, as described and illustrated.

7,501

AGLAONEMA PLANT NAMED SUPERBA

B. Frank Brown, Palm Bay, Fla., assignor to Hartman Plant Laboratories, Inc., Sebring, Fla.

Filed Jul. 5, 1989, Ser. No. 375,603
Int. Cl.[5] A01H *5/00*
U.S. Cl. Plt.—88 **1 Claim**

1. A new and distinct cultivar of Aglaonema plant named 'Superba', as described and illustrated.

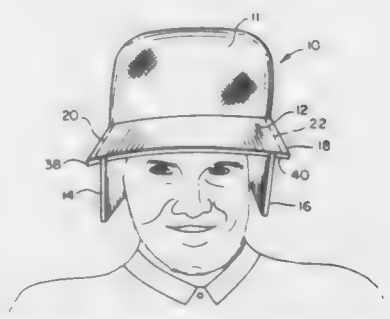
GENERAL AND MECHANICAL

5,007,108
CHEST PROTECTOR
Raymond Laberge, St. Luc, and Robert Beauregard, L'Acadie, both of Canada, assignors to Sport Maska Inc., St. Hyacinthe, Canada
Filed Aug. 29, 1989, Ser. No. 399,883
Int. Cl.[5] A41D *13/00*
U.S. Cl. 2—2 **18 Claims**



1. A chest protector for a sports player, said chest protector comprising:
a chest protector section, and
two arm protector sections secured at one end to said chest protector section,
each of said two arm protector sections including
a plurality of padding sections, each having two ends and each having at least one pad member, one of said two ends of at least one padding section being secured to an adjacent padding section centrally, intermediate the ends of the adjacent padding section by moving means for slidably mounting one padding section with respect to an adjacent padding section.

HEAD GEAR HAVING PROTECTIVE LENS
Robert L. Wheeler, 823 A E. Gulf Blvd., Indian Rocks Beach, Fla. 33535
Filed Oct. 20, 1989, Ser. No. 425,617
Int. Cl.[5] A42B *1/06*
U.S. Cl. 2—10 **19 Claims**

1. A device for shielding the eyes from direct or reflected sunlight, comprising:
a thin flexible lens of flat configuration when in repose;
said lens having a forward surface, a rearward surface, and a predetermined configuration;
a first pair of releasable fastening members being fixedly secured to opposite upper corners of said forward surface of said lens;
each member of said first pair of fastening members having an operative part that projects upwardly from said forward surface;
a headwear member;
a forwardly projecting bill member integral to said headwear member;
said bill member having a top surface and a bottom surface;
said bill member having a leading edge and an arcuate trailing edge that follows the contour of said headwear member;
a second pair of releasable fastening members fixedly secured to said bottom surface of said bill member at opposite ends thereof in closely spaced relation to said trailing edge;
said first and second pair of fastening members being of independent construction relative to one another;
said first and second pair of fastening members being releasably securable to one another;
said lens having a gradual bend formed therein adjacent said respective upper corners of said lens when said first and second independently constructed fastening members are releasably secured to one another, said respective upper corners being in closely spaced, parallel relation to said bill member bottom surface when said first and second independently constructed fastening members are releasably secured to one another.

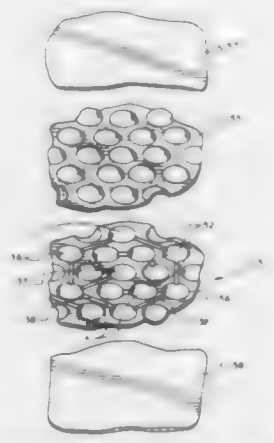
FOCUS VISION VISOR
Charles A. Gilbert, P.O. Box 979, USSAH, Washington, D.C. 20317
Filed Jul. 12, 1990, Ser. No. 551,343
Int. Cl.[5] A42B *1/06*
U.S. Cl. 2—10 **3 Claims**



1. A focus vision visor of the type adapted for fitting to the crown of a headpiece comprising:
(a) a horizontally extending visor defining a front edge, side edges and a rear edge adapted for attachment to the crown;
(b) a pair of blinders secured to each side edge of said visor so as to depend vertically thereof, each blinder being made of resilient material so as to abut the human cheek and having an inside and an outside defined by top, bottom, rear and front, each said blinder being pivotably secured at its top so as to be inset with respect to the side edges of said visor such that the side edges of the said visor overhang said blinders, said blinders being stitched to the side edges of said visor so as to be biased inwardly, the inner edge is foldable within the crown and said blinders being conformed such that their inner edge is foldable within the inside of the crown; and
(c) securement means attached to the underside of said visor and the in side of said blinder, such that each side blinder

may be stored in horizontal abutment with the underside of said visor.

5,007,111
SHOCK ABSORBING BOOT AND CUSHIONING MATERIAL

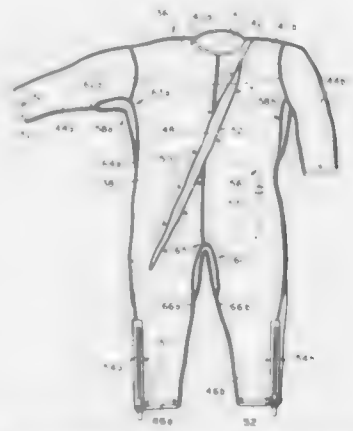
Mark B. Adams, 206 Ransui Mansion, 1-10 Minamizemi, Gifu Shi, Gifu Ken, Japan T502

Filed Sep. 14, 1989, Ser. No. 407,332
Int. Cl.[5] A41D *13/06*
U.S. Cl. 2—22 **29 Claims**

1. A cushion pad, comprising a plurality of fluid containing resilient cells or compartments as a dispersion array formed in a material; tube means for allowing fluid flow between cells or compartments in said dispersion array of cells, where each dispersion array comprises two or more cells with a first cell, wherein, for said first cell in each said dispersion array, at least one proximal cell is provided, with such proximal cell being a cell that is closer to the first cell than any other cell, and for each first cell at least one distal cell exists in each said dispersion array, a distal cell being any cell that is not a proximal cell; and the first cell in each dispersion array is connected by tube means to at least one distal cell.

5,007,112
PROTECTIVE COVERALLS WITH IMPROVED VENTILATION

Milton A. Lewis, Jr., Richmond, Va.; Jeffrey S. Mason, Covington, Ind.; Carson B. Swinford, Danville, Ill., and Timothy R. Wiseman, Sr., Richmond, Va., assignors to E. I. Du Pont de Nemours and Company, Wilmington, Del.



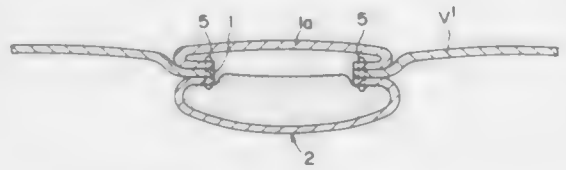
Filed Nov. 30, 1989, Ser. No. 444,497
Int. Cl.[5] A41D *13/00, 13/02*
U.S. Cl. 2—79 **8 Claims**

1. Improved one-piece protective coveralls of the type affording a barrier and thermal protection against hot and/or corrosive liquids having a generally continuous outer shell of woven aramid fabric covered by a liquid impervious layer and an inner multilayer thermally insulating liner inside of said outer shell, said inner liner being fabricated from at least one layer of low density nonwoven fabric fastened to a woven fabric, said outer shell and inner liner having corresponding torso, sleeve and leg portions, wherein the improvement comprises:

an elongate underarm opening under each arm of said liner extending downwardly from the position of the wearer's armpit into and along the underside of the sleeve and downwardly into and along the side of the torso portion;

an elongate leg inseam opening on the underside of the torso portion of said liner fabric and extending from position of the wearer's crotch downwardly into and along the inside of each leg; and

a stretchable, air permeable fabric attached to said liner fabric and covering and defining the size and shape of said openings;



whereby ventilation and greater freedom of movement is provided in said inner liner without substantially decreasing the protection provided by the coveralls.

CLOTHING, ESPECIALLY OF THE PULLOVER TYPE

Robert Bouadjadja, 133 rue Antoine-Durafour, 42100 St. Etienne, France

PCT No. PCT/FR88/00425, § 371 Date Apr. 27, 1989, § 102(e) Date Apr. 27, 1989, PCT Pub. No. WO89/01743, PCT Pub. Date Mar. 9, 1989
PCT Filed Apr. 24, 1988, Ser. No. 358,348
Int. Cl.[5] A41B *1/00, 1/02, 1/18;* **A41D** *27/08*
U.S. Cl. 2—115 **4 Claims**

1. An article of clothing comprising:

a fabric layer suitable for wearing;

at least one decorative element attached to an outer surface of said fabric layer, said at least one decorative element being stuffed with material to form a relief;

at least one inner layer attached to an inner surface of said fabric layer along the contours of said at least one decorative element; and,

wherein an inside of said fabric layer is smooth and stitchless.

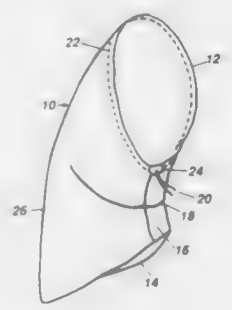
HUMIDITY-RETAINING MASK

Yasuhiko Numano, Tokyo, Japan, assignor to Japan Air Lines Co., Ltd., Tokyo, Japan

Filed Jun. 27, 1989, Ser. No. 371,975
Claims priority, application Japan, Jul. 14, 1988, 63-173762; Apr. 15, 1989, 1-94329
Int. Cl.[5] A61M *16/00*
U.S. Cl. 2—206 **7 Claims**

1. A humidity retaining mask for humidifying dry air of an environment to be respired by a wearer of the mask, said mask comprising:

an expandable mask body consisting of a honeycomb structure of moisture absorbing material defining a plurality of tubular cavities when the mask body is in an expanded state, said mask body having a recessed portion in an upper part thereof for accommodating the nostrils of a wearer of the mask and a lower part opposed to said upper part, and said tubular cavities extending between and open at the upper and lower parts of the mask body; and



ear straps attached to said mask and adapted to extend over the ears of a wearer of the mask to secure said mask body in a position in which the nose of the wearer confronts said recessed portion.

ADJUSTABLE HEAD AND NECK GARMENT

Nancy A. Denbow, 31197 Niakwa Rd., Evergreen, Colo. 80439, and Anne M. Bertino, 9605 S. 48th St., #2047, Phoenix, Ariz. 85044

Filed Feb. 13, 1990, Ser. No. 479,342
Int. Cl.[5] A42B *1/06, 1/04*
U.S. Cl. 2—208 **8 Claims**

1. An adjustable head and neck garment comprised of a tubular shaped body, with the sides of the tube varying in length from a maximum on one side of said tube to a minimum on the opposite side, such that the ends of said tube are at acute angles to the body of said tube, wherein a longitudinal cross section of said tube which intersects both said maximum and minimum length sides of said tube has an essentially trapezoidal shape.

5,007,116
PORTABLE URINAL

Masao Yamamoto, Tokyo, Japan, assignor to K. K. Mizuho, Tokyo, Japan

Filed Nov. 21, 1988, Ser. No. 274,258
Claims priority, application Japan, Aug. 16, 1988, 62-107850[U]
Int. Cl.[5] A47K *11/12*
U.S. Cl. 4—144.2 **1 Claim**

1. A portable urinal comprising:

a urine-storage bag constructed of a waterproof material, said urine-storage bag being provided at its top with a mouth element that can be located so as to cover the genitourinary area of a human body when in use; and a fastener located below said mouth and comprising a grooved channel provided along one half of the interior wall of said urine-storage bag and a mating ridge which is provided on the other half of the interior wall of said urine-storage bag, said ridge is adapted to engage said grooved channel in a snap-fit manner, both said grooved channel and said ridge extending across the entire width of said urine-storage bag so as to seal off said bag adjacent to said mouth element, and

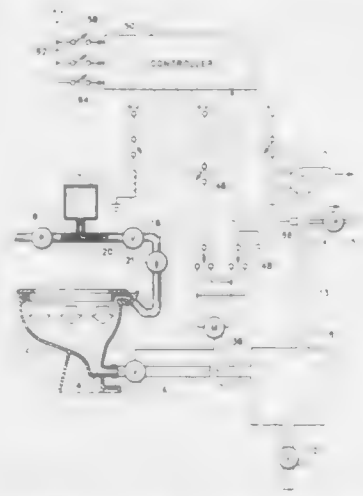
a pouch positioned within said bag which is constructed of a water-permeable, water-insoluble material, said pouch being filled with a water-absorbing agent which when contacted with a portion of said urine in said bag will swell to form a gel, the wall strength of said pouch being such that the pouch will break into fragments when said water-absorbing agent becomes swollen with said urine, and thereby dispense said agent to the remainder of said urine in said bag to render a gel of the entire contents of said bag.

5,007,117
VACUUM TOILET SYSTEM WITH SIMULTANEOUS RINSE AND DISCHARGE

Sven Oldfelt, Vaxholm, Sweden, and Gary L. Stahl, Winnebago, Ill., assignors to Oy Wärtsilä Ab, Helsinki, Finland

Filed Dec. 21, 1988, Ser. No. 288,620
Int. Cl.[5] E03D *11/00*
U.S. Cl. 4—432 **18 Claims**

1. An improved vacuum toilet system comprising:



a waste-receiving bowl defining an interior space for receiving waste material and having an outlet,

a sewer pipe defining an interior space that can be placed at a pressure that is lower than that in the interior space of the waste-receiving bowl.

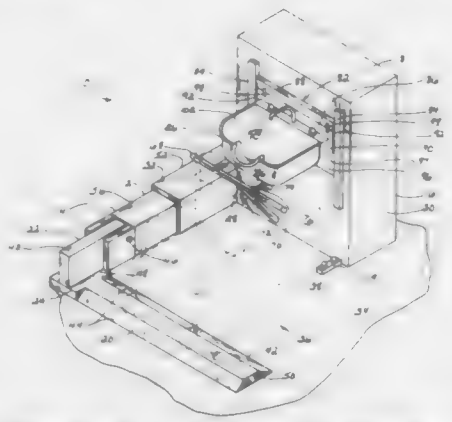
a discharge valve connected between the outlet of the waste-receiving bowl and the sewer pipe for controlling passage of material between the waste-receiving bowl and the sewer pipe,

rinse means for controlling supply of rinse liquid to the waste-receiving bowl, and

control means connected to the discharge valve and to the rinse means and responsive to a user stimulus to open and close the discharge valve in accordance with a predetermined operating cycle comprising an opening phase, an open phase and a closing phase, wherein the improvement resides in that, in order to reduce the level of noise gener-

ated by induction of air into the sewer pipe during the operating cycle of the discharge valve while maintaining a low level of water consumption, the control means control the rinse means in such manner that rinse liquid is supplied during the opening phase of the operating cycle of the discharge valve but substantially no rinse liquid is supplied while the discharge valve is closed or during the open phase of the operating cycle of the discharge valve.

5,007,118



HEAD CARE STATION AND KIT AND METHOD FOR RECLINING THE OCCUPANT OF A WHEELCHAIR AGAINST A HEAD SUPPORT

Larry W. Ebersole, 7826 Newlin Dr., Fort Wayne, Ind.

Filed Mar. 30, 1989, Ser. No. 330,705

Int. Cl.[5] **A45D** *19/00, 19/08, 44/10*

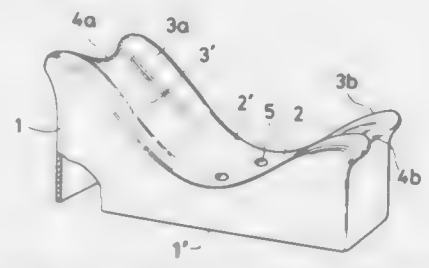
U.S. Cl. 4—515 **29 Claims**

1. A head care station comprising a foundation member having a front portion and a back portion, a pedestal mounted on said back portion, a wheelchair jack mounted to said front portion, said wheelchair jack having a bearing member movable between a floor position and an elevated position, a head support connected to said pedestal, said head support being movable between a lower position and an upper position, a bolster connected to said pedestal, said bolster being disposed at a vertical elevation above said elevated position of said wheelchair jack, said wheelchair jack and said bolster defining between them in conjunction with the floor upon which said head care station rests a wheelchair occupancy space.

21. A head care station comprising a bolster and a wheelchair jack disposed in spaced relation to said bolster, said wheelchair jack having a bearing member pivotably movable relative to said bolster between a floor position and an elevated position, said wheelchair jack and said bolster and the floor on which a wheelchair and said bolster and said wheelchair jack are supported, thereby defining a wheelchair occupancy space free of other structure, whereby a wheelchair on said floor in said wheelchair occupancy space is held secure and urged against said bolster while being raised and pivoted about its axle by said wheelchair jack.

5,007,119

INFANT'S CHAIR FOR SHAMPOOING



Sumiko Yamaguchi, Shizuoka, Japan, assignor to Sumiko Yamaguchi and Tomohiro Shirakawa, both of Fuji, Japan

Continuation of Ser. No. 637,602, Aug. 3, 1984, abandoned. This application Mar. 1, 1989, Ser. No. 319,872

Claims priority, application Japan, Aug. 11, 1983, 58-145632; Sep. 29, 1983, 58-149613

Int. Cl.[5] **A45D** *44/02*

U.S. Cl. 4—523 **13 Claims**

1. A chair for supporting varying sizes of infants during a shampooing operation, comprising:

a base portion having a bottom horizontal surface for placement upon a support surface, and an upper infant supporting surface having opposite ends and opposite lateral edges;

said infant supporting surface comprising a smoothly depressed concave seating portion adapted to receive an infant's buttocks, and first and second back supporting portions extending upwardly from opposite ends of said seating portion for alternatively supporting an infant's back, said back supporting portions being of dissimilar length and each being provided at its upper end with a hollow adapted to support the back of an infant's neck while said infant's buttocks are supported by said seating portion and said infant's back is supported by one of said back supporting portions;

each one of said hollows being formed by a concavity centered with respect to its respective back supporting portion, said concavity extending upwardly toward a respective one of said opposite ends of said infant supporting surface;

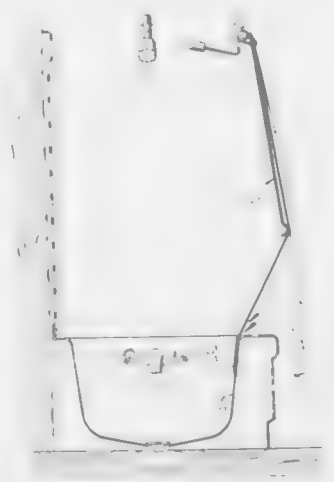
said seating portion defined a continuously smooth concave curvature extending between said opposite lateral edges of said infant supporting surface;

said first back supporting portion including an inclined surface extending upwardly in a first direction at a first predetermined angle with respect to said concave seating portion from one end of said smoothly depressed concave seating portion of said chair toward one end of said chair and having a first predetermined length for stably supporting the torso portion of a first infant's body, having a first length dimension, as defined between the buttocks of said first infant and the neck of said first infant, which is characteristic of an average sized child within the range of 2-3 years of age; and

said second back supporting portion including an inclined surface extending upwardly in a second direction, opposite to said first direction, at a second predetermined angle with respect to said concave seating portion from the other end of said smoothly depressed, concave seating portion of said chair toward the other end of said chair and having a second predetermined length, which is less than said first predetermined length of said first inclined surface, for stably supporting the torso portion of a second infant's body, having a second length dimension, as defined between the buttocks of said second infant and the neck of said second infant, which is smaller in length than said torso portion of said first infant supported upon said first inclined surface, and which is characteristic of an average sized child of up to and including at least one year of age, said first and second inclined surfaces, together with said smoothly depressed, concave seating portion, having a substantially V-shaped configuration.

5,007,120

SHOWER CURTAIN LINER CONTROL DEVICE



Charles A. Annand, 4 Ridgewood Drive, Truro, Nova Scotia, Canada B2N 5C5

Filed Apr. 23, 1989, Ser. No. 344,994

Claims priority, application Canada, Jan. 20, 1989, 588731

Int. Cl.[5] **A47K** *3/00*

U.S. Cl. 4—558 **9 Claims**

1. A shower curtain control device for controlling the position of a shower curtain having an inner and outer surface of the type suspended form a curtain rod of circular cross section having an inner surface toward the tub and an opposite outer surface positioned above an outside rim of a bathtub, said curtain being attached to curtain rod hooks slidable along said curtain rod to enable the curtain to be extended from an open position to a closed position in which said inner surface of the curtain defines one side of a shower area, said device comprising:

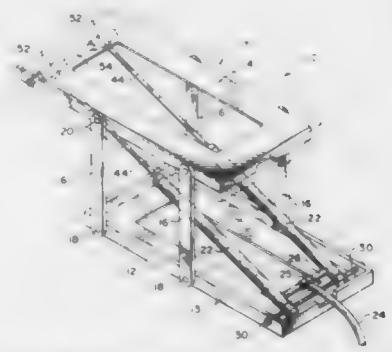
a mounting section having an opening for receiving said curtain rod and permitting both rotational pivoting and sliding movement of said device on said curtain rod,

said mounting section including an inverted U-shape defining the rod receiving opening between a pair of downwardly extending legs jointed by a curved mid-portion for riding on top of said rod, one leg extending on the side of said inner surface of said curtain rod, the other leg extending on the side of said outer surface of said curtain rod,

an elongated member connected to said other leg and depending therefrom and having a lower end portion for engagement with the inner surface of the curtain at a location spaced between the support rod and rim of said bathtub, and

weight means including an elongated portion joined to said one leg of said pair and extending at an angle relative thereto projecting over said shower area for causing pivoting of said mounting section in a direction to swing said lower end portion of said elongated member outward from the shower area, whereby said curtain is held outward relative to the outer rim of said bathtub.

5,007,121



HYDRAULIC LIFT FOR BATHTUBS

Robert J. McEathron, 857 Townsite Road, Nanaimo, British Columbia, Canada V9S 1L8

Continuation of Ser. No. 244,700, Sep. 14, 1988, abandoned. This application May 29, 1990, Ser. No. 529,789

Int. Cl.[5] **A47K** *3/12*

U.S. Cl. 4—566 **4 Claims**

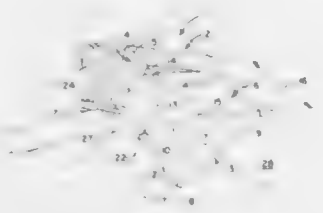
1. A device for raising and lowering a person in a bathtub, comprising:

(a) a base frame sized to fit in the bottom of a standard bathtub and having first and second opposing sides and forward and rearward ends;

(b) a substantially horizontal platform having first and second opposing sides and forward and rearward ends which correspond to those of said base frame;

(c) two pairs of rigid support members of equal length, each support member having upper and lower ends, the upper ends of the first pair of support members being pivotally attached about fixed pivot points at spaced locations to one side of said platform and the lower ends of said first pair of support members being pivotally attached, about fixed pivot points at spaced locations to one side of said base, and the upper ends of the second pair of support members being pivotally attached about fixed pivot points at spaced locations to the second side of said platform and the lower ends of said second pair of support members being pivotally attached about fixed pivot points at spaced locations to the second side of said base, the distance between the points of attachment of said upper ends of a pair of support members being approximately equal to the distance between the points of attachment of said lower ends of said pair of support members, whereby at any point during upward motion of said platform relative to said base the said four points of attachment of each pair of support members forms a parallelogram with the base frame and platform; and

(d) means for pivoting said platform relative to said base comprising a pair of hydraulic cylinders connected to household water supply for hydraulic pressure and each having a first end pivotally connected to said base via a bar, the axis of rotation of said pivotal connection of said first end of said hydraulic cylinders being perpendicular to the length of said base and located closer to said rearward end of said base than said pivotal connections of said lower ends of said support members, and a second end pivotally connected to said platform via a sleeve, the axis



of rotation of said pivotal connection of said second end of said hydraulic cylinders being perpendicular to the length of said horizontal platform and located closer to said forward end of said platform than said pivotal connections of said upper ends of said support members.

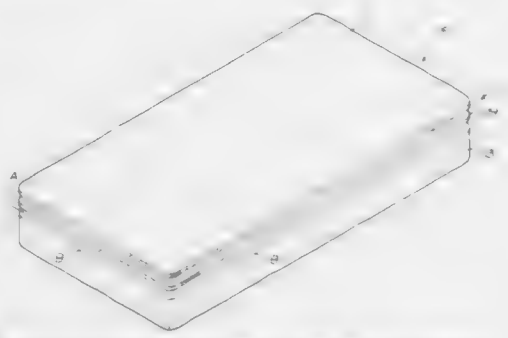
HEAD RESTRAINT

Annette S. Daughdrill, 13228 Briargrove Ave., Baton Rouge, La. 70810

Filed Aug. 6, 1990, Ser. No. 563,049
Int. Cl.[5] A47G *9/00*
U.S. Cl. 5—434 6 Claims



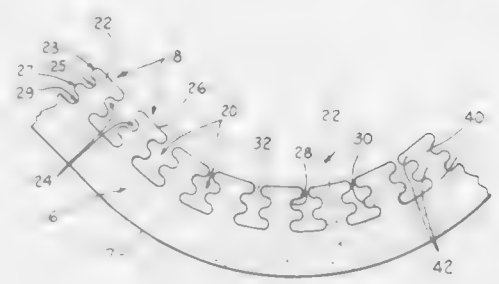
1. A head restraint adapted to immobilize the head of a patient in a supine position, comprising a resilient block having an exterior surface and including:
a. a bottom;
b. an inclined front face having a top edge;
c. a rear face;
d. sidewalls;
e. a cavity in said front face forming an interior cavity wall dimensioned to contact a substantial portion of the top, rear and sides of a patient's head, while leaving the face of the patient exposed, the intersection of said cavity and said front face having a circumference less than the rear peripheral circumference of the head of a patient, and
f. a split, opening between said cavity and said exterior surface, intersecting said rear face, said top edge and said front face above said cavity.

5,007,123

FLEXIBLE COVERING FOR REDUCING MOISTURE/VAPOR/BACTERIA TRANSMISSION

Donald M. Salyards, Winona, Minn., assignor to Comfortex, Inc., Winona, Minn.

Filed Jul. 5, 1990, Ser. No. 548,243
Int. Cl.[5] A47C *27/00*
U.S. Cl. 5—448 20 Claims



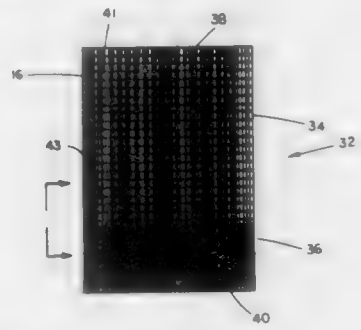
10. A sanitary and therapeutic mattress comprising:
a core;
an outer covering for forming a first moisture/vapor/bacteria barrier, the outer covering having a flexibility sufficient to reduce tissue pressures which cause the formation of body sores, and
an inner covering for forming a second moisture/vapor/bacteria barrier, the inner covering being positioned between the outer covering and the core of the mattress and having a flexibility substantially equal to the flexibility of the outer covering;
wherein the outer and inner coverings are made of materials selected such that moisture vapor transmission through both the outer and inner coverings is less than about 10.7 grams/hr/mz at a temperature of about 99 degrees F and a relative humidity of about 85%.

5,007,124

SUPPORT PAD WITH UNIFORM PATTERNED SURFACE

Richard W. Raburn, Mauldin, and Daniel J. Schaefer, Greenville, both of S.C., assignors to Span-America Medical Systems, Inc., Greenville, S.C.

Filed Nov. 4, 1988, Ser. No. 267,202
Int. Cl.[5] A47C *27/14*
U.S. Cl. 5—481 12 Claims



1 A mattress pad, comprising:
a generally rectangular base of resilient material, said base having a relative longitudinal axis, and a generally planar support surface on one side of said base adapted for resting on a mattress or the like; and
a plurality of elongated members formed of resilient material, and integrally associated with side base on a second side thereof opposite said one said thereof, said elongated members being situated parallel to one another and generally perpendicular to said base longitudinal axis, with predetermined constant longitudinal spacing between adjacent such members so as to form a uniform support surface with said second side;
wherein each of said elongated members have generally the same predetermined profile, viewed in a cross-sectional plane situated parallel to said base longitudinal axis and normal to said base second side, said profile having at least three distinct regions of different widths, whereby progressive collapse of said members responsive to a load received thereon results in varying resilient support characteristics presented to such load, so that relatively heavier loads are correspondingly provided relatively greater resilient support even though said pad has a uniform support surface on said second side thereof with said members all having predetermined constant spacing therebetween; and
wherein said different width regions include at least one relatively smaller width region which is situated in said profile so as to have at least one relatively larger width region between itself and said base.

5,007,125

BLANKET HAVING IMPROVED THERMAL CHARACTERISTICS IN THE PORTION COVERING THE FEET

Daniel B. Owenby, Swannanoa, N.C., assignor to Beacon Manufacturing Company, Swannanoa, N.C.

Filed Dec. 26, 1989, Ser. No. 457,307
Int. Cl.[5] A47G *9/02*
U.S. Cl. 5—486 6 Claims

1. A blanket comprising:
a rectangular panel constructed of woven yarn; said panel having an upper portion and a lower portion; said upper portion and said lower portion being woven together; said panel including a plurality of warp yarns and a plurality of filler yarns; said warp yarns running continuously through said upper portion and said lower portion; at least a part of said lower portion having more filler yarns per linear unit than said upper portion such that the thermal insulation characteristics of said part of said lower portion is substantially greater than the thermal insulation characteristics of said upper portion whereby the lower extremities of the user are enabled to be better insulated than other parts of the user's body; the parts of said filler yarns which pass over said warp yarns in said part of said lower portion form a weave which is more raised than the weave of said filler yarns which pass over said warp yarns in said upper portion.

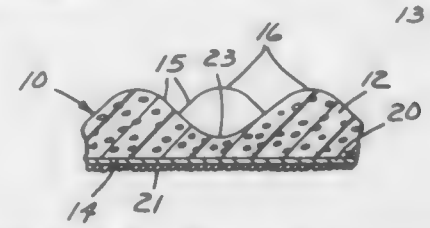
HYDROBRUSH WITH SPEED-REDUCER OF THE EPICYCLIC TYPE

Bizzarri Paolo, Monte S. Pietro, Italy, assignor to Gordon S.n.C. di Bizzarri Paolo e C., Minerbio, Italy

Filed Oct. 11, 1989, Ser. No. 419,777
Claims priority, application Italy, Oct. 26, 1988, 15174 8/88
Int. Cl.[5] A46B *13/06*
U.S. Cl. 15—29 3 Claims



1. A hydrobrush comprising:
an enclosed housing including (a) an outer body (3) having a top, a peripheral side depending from said top and having an inner crown gear (303), and an upper bushing (103) depending from and integrally formed with said top, and (b) a collar (8) which is secured to said peripheral side of said body, said collar including a lower bushing (108) and spokes (208) which mount said lower bushing beneath said upper bushing;
a small Pelton turbine disposed in said enclosure, said turbine including a water jet means which is connectable to a pressure of a water main for producing a driving water jet and an impeller which is rotatable mounted about said upper bushing and disposed to be rotated by the water jet, said impeller including a hub (104) having an integral toothed wheel (504);
a shaft (7) including an upper end portion (207) which is rotatably mounted by said upper bushing, an intermediate portion (107) which extends through said hub of said impeller, a further portion (407) which is rotatably mounted by and which extends through said lower bushing, and a lower end portion (507–607);
a support (6) which is keyed to said intermediate portion of said shaft for rotation therewith;
a plurality of satellite gears mounted for rotation to said support and meshingly engaging both said toothed wheel of said hub and said inner crown gear of said outer body, said satellite gears having a diameter greater than that of said toothed wheel such that rotation of said impeller and toothed wheel thereof causes a lower rate of rotation with greater torque of said satellite gears, said support member and said shaft; and
a cleaning brush which is attached to said lower end portion of said shaft for rotation therewith.

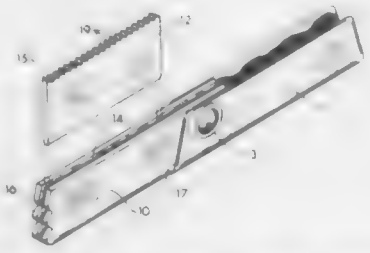
5,007,128

COMPOUNDING, GLAZING OR POLISHING PAD

Richard L. Englund, and Thomas W. Schwartz, both of St. Paul, Minn., assignors to Minnesota Mining and Manufacturing Company, St. Paul, Minn.

Continuation-in-part of Ser. No. 298,508, Jan. 18, 1989, Pat. No. 4,962,562. This application Dec. 28, 1989, Ser. No. 458,411
Int. Cl.[5] B24B *29/00*
U.S. Cl. 15—230.16 50 Claims

1. A paint finishing pad adapted to be used on a drive assembly including a back up pad having a generally planar support surface and a drive motor for moving the back up pad in a plane parallel to said support surface while using the finishing pad to apply glazing or compounding material to a painted surface and thereby remove imperfections along the polish and painted surface, said finishing pad comprising:
a layer of resiliently compressible open cell polymeric foam having a generally planar rear surface, said layer comprising a plurality of spaced projecting portions projecting a first distance at a right angle from said rear surface, and a plurality of recessed portions between said projecting portions and projecting a second distance at a right angle from said rear surface, which second distance is significantly less than said first distance, said projecting and recessed portions at least partially defining a front surface for said layer of foam opposite said rear surface, said open cell polymeric foam from which said layer is formed being a reticulated urethane foam; and
means attached to said rear surface adapted for releasably attaching said paint finishing pad tot he support surface of the drive unit;
said layer of foam being sufficiently resiliently compressible to allow the layer of foam to be pressed manually against the painted surface to compress the portions of the layer



of foam toward the rear surface of the layer of foam and cause the parts of the front surface of the layer of foam defined by both the projecting portions and the recessed portions to generally conform to the painted surface and press the glazing or compounding material into engagement with the painted surface for efficient removal of imperfections, and subsequently to allow the layer of foam to be manually pressed against the painted surface with a lesser force only sufficient to compress parts of the projecting portions of the layer of foam to complete polishing of the painted surface.

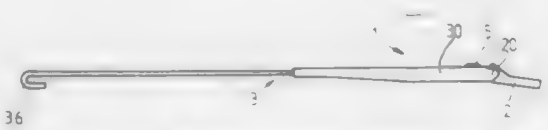
WIPER CLEANING SYSTEM

Julin J. Jacoby, 1919 Paper Mill Rd., Huntingdon Valley, Pa. 19006

Continuation-in-part of Ser. No. 406,309, [illegible]p. 12, 1989, Pat. No. 4,934,013. This application Feb. 26, 1990, Ser. No. 484,763
Int. Cl.[5] A47L *25/00*; B60J *1/20*; B60S *1/62*
U.S. Cl. 15—250 R 11 Claims



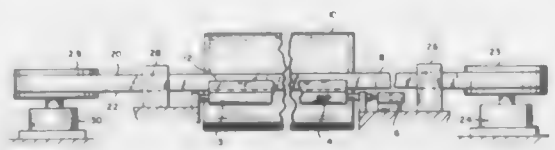
1. A wiper cleaning system for removing debris and other foreign matter from a wiper for a surface such as a windshield serviced by a wiper, said system comprising a plurality of discrete raised elements projecting from said surface, said elements being arranged in horizontally extending rows that are vertically spaced, said rows extending for a distance corresponding to the length of the wiper, said elements being arranged in parallel horizontal alignment in each row and in generally vertical alignment in alternate rows and in staggered alignment in adjacent rows, said elements being spaced from each other by a distance such that debris and other foreign matter removed from the wiper by the system can be channeled therebetween.

5,007,131

BLADE CARRYING ASSEMBLY FOR A WINDSHIELD WIPER INCLUDING A LOCK

Jean-Claude Chevalier, Issoire, and Guy Raymond, Champeix, both of France, assignors to Valeo Systems d'Essuyage, Issy-Les-Moulineaux, France

Filed Mar. 16, 1989, Ser. No. 324,537
Claims priority, application France, Mar. 22, 1988, 88 036[illegible]
Int. Cl.[5] A47L *1/02*
U.S. Cl. 15—250.19 10 Claims



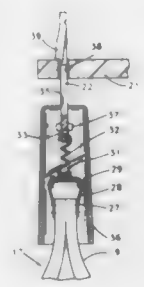
1. A blade carrying assembly for a windshield wiper, said assembly comprising:
- a coupling head,
- a wiper arm to carry at one end thereof a wiper blade and articulated at another end thereof to said coupling head about a pivot axis;
- spring means biassing said wiper arm about said pivot axis relative to said coupling head in a direction to urge said one end of said wiper arm to a windshield wiping operative position, and
- a lock member rotatably mounted on said wiper arm and having locking means for, upon rotation of said lock member to a locking position thereof, limiting the extent of rotation of said wiper arm about said pivot axis in said direction.

5,007,132

HYDRAULIC DRIVE FOR PULL THROUGH DOCTOR BLADE TRANSFER SYSTEM

Robert A. Reid, Charlton City, and Ronald F. Goodnow, Leicester, both of Mass., assignors to Thermo-Electron Web Systems, Inc., Auburn, Mass.

Filed Jun. 7, 1990, Ser. No. 534,686
Int. Cl.[5] B08B *1/02*
U.S. Cl. 15—256.53 4 Claims



1. For use in a doctoring apparatus wherein a coiled elongated doctor blade is payed off one rotatable reel while simultaneously being taken upon another rotatable reel, with an intermediate portion of the blade extending between said reels being supported by a blade holder arranged to apply said blade to a moving surface toe doctored, a hydraulic drive system for longitudinally shifting said blade across said surface and through said blade holder from one to the other of said reels, said system comprising:
- first and second hydraulic motors, each motor being drivingly connected to one of said reels, said motors being of the type which are powered by a pressurized flow of hydraulic fluid admitted thereto via a high pressure port and discharged therefrom via a low pressure port;
- a reservoir containing a supply of hydraulic fluid;
- pump means for withdrawing hydraulic fluid from said reservoir and for discharging a pressurized flow of said fluid;
- low pressure conduit means communicating with the low pressure ports of said hydraulic motors to provide a fluid connection therebetween;
- high pressure conduit means communicating with said reservoir, said pump means, and the high pressure ports of said hydraulic motors; and
- control value means associated with said high pressure conduit means, said control valve means being adjustable between a first setting at which said pump means is connected to the high pressure port of said first hydraulic motor and the high pressure port of said second hydraulic motor is connected to said reservoir, and a second setting at which said pump means is connected to the high pressure port of said second hydraulic motor and the high pressure port of said first hydraulic motor is connected to said reservoir;
- whereupon when said control valve means is adjusted to said first setting, said first reel is driven to take up said doctor blade thereon, with the doctor blade being simultaneously payed off said second reel, causing said second motor to pump the low pressure fluid discharge received from said first motor via said low pressure conduit means back to said reservoir, and when said control valve means is adjusted to said second setting, said second reel is driven to take up said doctor blade thereon, with said doctor blade being payed off said first reel and causing said first motor to pump the low pressure fluid discharge received from said second motor via said low pressure conduit means back to said reservoir.

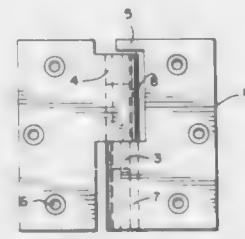
CONVERTIBLE VACUUM CLEANER

John R. Lackner, North Ridgeville; Stanley E. Grzywna, Elyria; Ralph A. Weber, Richmond Heights, all of Ohio, and Thomas E. Baird, Springfield, Ill., assignors to The Scott Fetzer Company, Cleveland, Ohio

Filed Jun. 6, 1990, Ser. No. 534,192
Int. Cl.[5] A47L *9/14*
U.S. Cl. 15—351 5 Claims



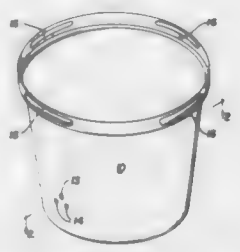
1. A vacuum cleaner comprising a power unit having structure defining a nozzle and an outlet and being operable to draw in dirt-laden air through said nozzle and to discharge said air through said outlet, an elongated dust bag connected at one end to said outlet, an elongated first handle, pivot apparatus for mounting said first handle on said power unit for movement between first and second positions, a connector mounted on the other end of said dust bag for movement between an extended position and a retracted position, said connector being releasably mounted to said handle at a fixed location spaced from said pivot apparatus and resilient means connected between said connector and said other end of said dust bag for resiliently urging said connector toward said retracted position, said resilient means operating to compensate for pivotal movement of said handle to maintain said bag extended in all positions of said handle.

5,007,134

REMOVABLE HINGE AT SPECIFIC ANGULAR ORIENTATION

Ferdinand G. Stanford, 826 Covey Hill Road, Hemmingford, Quebec, Canada H0L 1H0

Filed Sep. 2, 1986, Ser. No. 902,661
Claims priority, application Canada, Feb. 19, 1986, 502191
Int. Cl.[5] E05D *7/10*
U.S. Cl. 16—266 1 Claim



1. A dual purpose hinge for an inwardly opening door comprising in combination:
- a first hinge blade with a first sleeve;
- a second hinge blade with a second sleeve aligned with said first sleeve;
- a hinge pin fixed in said second sleeve of said second hinge blade and projecting therebelow into said first sleeve;
- said first hinge blade including a projecting tongue at the top edge of said first hinge blade;
- said second hinge blade including a slot at the top edge of said second sleeve arranged to permit said tongue on said first hinge blade to slide into said slot on said second sleeve allowing said second hinge blade to be disconnected from said first hinge blade only when said hinge blades are abutting.

5,007,135

PLANT GROWING RECEPTACLE

Robert Rigsby, 18671 Palm Creek Dr., Ft. Myers, Fla. 33917

Filed Jun. 18, 1990, Ser. No. 539,885
Int. Cl.[5] A01G *9/02*, *27/00*
U.S. Cl. 47—73 6 Claims

1. A plant growing receptacle having a plant positioned therein for further growth said receptacle comprising an open top and a side wall extending downwardly to a closed bottom wall, a first root exiting opening formed in said side wall at a distance above said bottom wall, drain openings formed in said side wall intermediate said root exiting opening and said closed bottom wall, a wall portion extending between said drain openings and said closed bottom wall having no openings therein and with said bottom wall being capable of retaining

water, a source of water for irrigating said plant in said receptacle, said source extending over the upper open end of said receptacle, a mixture of soil and fertilizer placed within said receptacle to promote further growth of the plant therein, said irrigating regulated as to allow feeding of water to the upper portion only of the receptacle and to the mixture of said soil and fertilizer therein, said water gravitating towards the bottom of said container and in its travel toward the bottom of the container some of the water, soil and fertilizer gravitating towards the bottom of the receptacle to there form a slurry of water, soil and fertilizer thereon, intermediate the said drain openings and bottom of said receptacle thus providing a moist environment within the receptacle.

PROCESS FOR THE PRODUCTION OF A YARN FROM FIBER MATERIAL

Peter Artzt, Reutlingen, and Heinz Mueller, Metzingen-Neuhausen, both of Fed. Rep. of Germany, assignors to Schubert & Salzer Maschinenfabrik Aktiengesellschaft, Ingolstadt, Fed. Rep. of Germany

Continuation of Ser. No. 383,854, Jul. 21, 1989, abandoned. This application Jul. 24, 1990, Ser. No. 559,388

Int. Cl.[5] **D01B** *9/00*; **D01G** *12/00*

U.S. Cl. 19—65 A **15 Claims**

1. A process for producing yarn, comprising the following steps:

(a) supplying fiber to a card;

(b) carding said fiber to remove impurities therefrom and forming a card sliver from the carded fiber,

(c) analyzing a sample of said card sliver to determine fiber length distribution therein;

(d) combing said card sliver to remove a predetermined portion of said fibers in accordance with the results of the analysis conducted on said sample of said card sliver and producing a combed sliver;

(e) drawing said combed sliver to align the fibers in said combed sliver;

(f) opening said combed sliver to form opened fibers and to remove impurities therefrom,

(g) conveying said opened fibers to an open-end spinning device; and

(h) spinning yarn from said opened fibers

5,007,137

CARDING APPARATUS

Horst Graute, Coesfeld, Fed. Rep. of Germany, assignor to Hergeth Hollingsworth GmbH, Dulmen, Fed. Rep. of Germany

Filed Jan. 4, 1990, Ser. No. 460,706

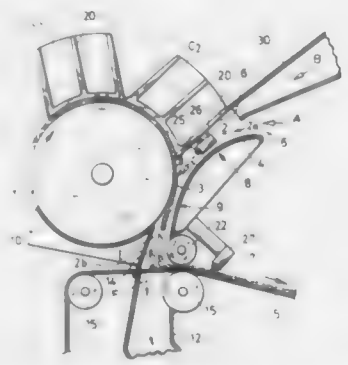
Claims priority, application Fed. Rep. of Germany, Jan. 18, 1989, 3901313

Int. Cl.[5] **D01G** *25/00, 15/46*

U.S. Cl. 19—296 **29 Claims**

1. Carding apparatus for forming air laid fibrous webs, comprising:

means for feeding fibers;



a driven main cylinder;

an air-permeable web conveying means receiving a web from said main cylinder;

an air passage substantially tangential to the main cylinder adjacent a fiber doffing zone and extending to said air-permeable web conveying means;

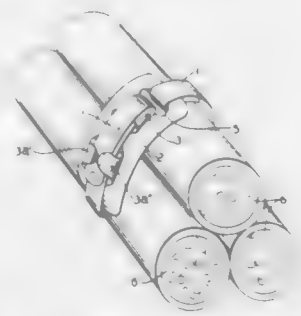
a suction means arranged beneath the web conveying means;

an air suction gap having a substantially nozzle-shaped cross section forming an upper portion of the air passage producing a laminar air stream;

said main cylinder exerting a centrifugal force, said centrifugal force throwing the fibers in the fiber doffing zone into said laminar air stream generated in said air passage and conveying said fibers to the web conveying means for deposit as a continuous fiber web; and

whereby carding apparatus especially suitable for manufacturing nonwovens is provided.

5,007,138



DEVICE FOR STRAPPING CABLES, PIPES OR OTHER SIMILAR ITEMS, TOGETHER OR TO SUPPORTS

David A. Pritchard, 3 Harvest Road, Englefield Green, Egham, Surrey, and Michael J. Donnelly, 137 Slough Road, Datchet, Berkshire, both of England

Continuation of Ser. No. 661,409, Oct. 16, 1984, abandoned. This application Aug. 25, 1986, Ser. No. 899,947

Int. Cl.[4] **B65D** *63/06*

U.S. Cl. 24—23 B **9 Claims**

1. A strapping device for joining cables, pipes or similar items together or to a support, and which may be assembled around such items easily and without the use of tools, said strapping device comprising

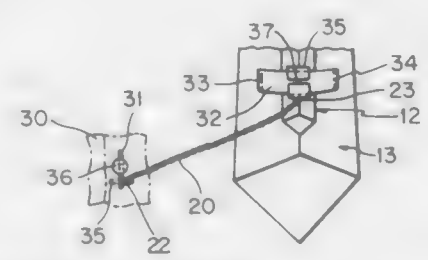
an elongate strip of bendable material having one end and an opposite end and so as to define an opposite end portion adjacent said opposite end, and substantially parallel longitudinal side edges,

a buckle plate attached to said one end of said strip, said buckle plate having an outer surface, and means mounted on said plate for receiving and holding said opposite end portion of said strip after the strip has been wrapped around the items to be joined, said strip receiving and holding means comprising

(a) a bridge portion extending transversely of said buckle plate at a location longitudinally spaced from said one end of said strip and defining a first longitudinal passageway, with said first passageway having a transverse width greater than the width of said strip and being sized so as to be adapted to receive a portion of the strip therethrough, and

(b) a pair of transversely spaced apart ears extending outwardly from said outer surface of said plate at a location longitudinally spaced from said bridge portion and on the side of said bridge portion opposite said one end of said strip, said ears each having an outwardly extending base portion and a transversely extending outer end portion, with said base portions of said ears being transversely spaced apart a distance greater than the width of said strip so as to be adapted to receive a portion of the strip therebetween, and with said outer end portions extending generally parallel to said outer surface of said plate and so as to define a transverse gap between said outer end portions, and such that said ears collectively define a second longitudinal passageway which is in longitudinal alignment with said first passageway, and with said ears being configured and dimensioned so as to permit said opposite end portion of said strip to be longitudinally inserted through said second passageway and then through said first passageway, then bent over said bridge portion so as to provide a superposed end portion which is positioned over the portion of the strip passing through said second passageway, and then passing the superposed end portion of the strip through said gap and into said second passageway by tilting said superposed end portion and transversely inserting one of said side edges thereof sideways through said gap and beneath one of said ears until the other of said side edges thereof has passed through said gap and into said second passageway, and then pushing said superposed end portion transversely in the opposite direction until the other of said side edges is positioned under the other of said ears, and so that the superposed end portion is secured within said second passageway.

5,007,139



NECKTIE RETAINER

Mark E. Ahern, 1278 Southwest Highpoint La., Palm City, Fla. 34990

Continuation-in-part of Ser. No. 404,180, Sep. 7, 1989, abandoned. This application Jul. 10, 1990, Ser. No. 550,204

Int. Cl.[5] **A41D** *25/10*

U.S. Cl. 24—49 R **4 Claims**

1. A necktie retainer in combination with a necktie and the garment of the wearer, said necktie when being worn having a large end portion with front and rear sides that lies essentially flat against said garment, said large end portion having a cross member positioned in transverse relationship to the long dimension and on said rear side thereof, said cross member having length, height and thickness dimensions and further having the portions thereof at the ends of said length dimension attached to said large end portion, comprising in combination:

a tensor member having a movement establishing length between first and second ends,

means retaining said first end of said tensor member to the garment of the wearer,

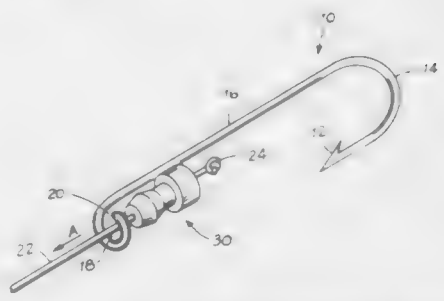
a detachable member attached to said second end of said tensor member,

said detachable member having an essentially "C" shape,

the opening of said "C" shape being a transverse slot of the order of said thickness dimension of said cross member, and

the top to bottom internal dimension of said "C" shape being of the order of said height dimension of said cross member such that said detachable member grips said cross member.

5,007,140



SNAP-ON FASTENER

Charles D. Brookey, 11291 E. Broadway, Tucson, Ariz. 85748

Filed Feb. 26, 1990, Ser. No. 484,906

Int. Cl.[5] **F16G** *11/00*; **A01K** *91/04*

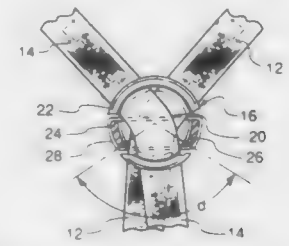
U.S. Cl. 24—129 R **8 Claims**

1. A fastener for an eye and line combination, comprising:

(a) an eye, wherein an opening in the rim constituting said eye is provided for inserting said line into said eye; and

(b) a stopper of size suitable for mechanical coupling and cooperation with said eye, said stopper having a hole capable of receiving said line and of preventing a knot tied on it from sliding through it, having a groove for receiving and holding in place the inside perimeter of said eye, and further having a stop to prevent said stopper from sliding out of said eye when a pulling force is applied to said line, said stop consisting of an enlarged end portion of said stopper.

5,007,141



STRAP RETAINER FOR HEAD GEAR

James J. Gentes, Soquel, Calif., assignor to Giro Sport Design, Soquel, Calif.

Filed Jun. 30, 1989, Ser. No. 373,417

Int. Cl.[5] **A44B** *11/00*; **A42B** *7/00*

U.S. Cl. 24—163 R **21 Claims**

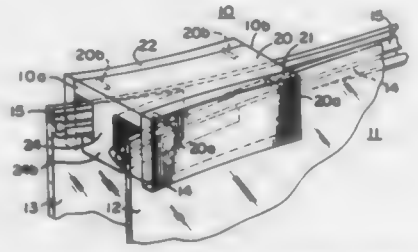
1. A strap retainer, comprising:

a first generally planar configured member;

a second generally planar configured member disposed in spaced-apart relationship to said first member;

a first post connecting one side of said first member to a corresponding side of said second member;

a second post disposed in spaced-apart relationship to said first post and connecting another side of said first member to another corresponding side of said second member; and



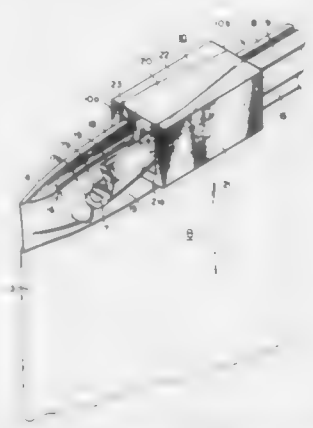
resilient band means disposed about said posts and cooperating with said first and second members and said first and second posts to form a pair of passageways, one on each side of said band means, through which each strap of a pair of straps may be respectively passed, whereby independently pulling on one of said straps results in said strap being freely pulled through its respective passageway, but simultaneously pulling on both of said straps results in said straps combining to engage and stretch said band means causing said band means to resist displacement of said straps and causing said straps and said band means to bind against said first and second members so as to further resist displacement of said straps.

5,007,142

METHOD OF ASSEMBLING A SNAPPED-TOGETHER MULTIPART PLASTIC SLIDER WITH A PLASTIC RECLOSABLE FASTENER

Fox J. Herrington, Holcomb, N.Y., assignor to Mobil Oil Corp., Fairfax, Va.

Filed Mar. 7, 1990, Ser. No. 490,107
Int. Cl.[5] A44B *19/16*
U.S. Cl. 24—400 **12 Claims**



10. A multipart plastic slider for straddling relation with a profiled plastic reclosable fastener particularly suited for thermoplastic bags and the like formed by a pair of flexible plastic sheets having a top edge with separable fastener means extending along the length thereof comprising reclosable interlocking rib and groove profile elements on the respective sheets, the straddling slider for closing or opening the reclosable fastener elements comprising a wedge-shaped separator finger and interlocking complimentary structure formed from plastic for moving along the fastener, the complimentary structure comprising a transverse support member having the wedge-shaped separator finger depending therefrom, said support member having interlocking structure on the opposite sides thereof, a pair of spaced depending side walls supported on said support member for engaging and automatically interlocking with said interlocking structure, said depending side walls extending from an opening end of the slider to a closing end, the side walls being spaced wider apart at the opening end to permit separation of the rib and groove elements by the wedge-shaped separator finger extending between the side walls at the opening end, the side walls being space sufficiently close together at the closing end to press the rib and groove elements into interlocking relationship as the slider is moved in a fastener closing direction, at least one of said separator finger and said side walls having shoulder structure on the bottom thereof for cooperating with the bottom of the fastener to prevent the slider from being lifted off the top edge of the fastener while the slider straddles the fastener.

5,007,143

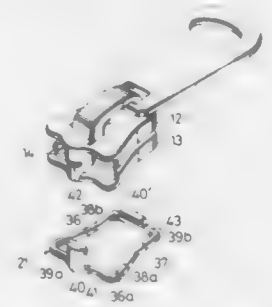
ROLLING ACTION ZIPPER PROFILE AND SLIPPER THEREFOR

Fox J. Herrington, Holcomb, N.Y., assignor to Mobil Oil Corp., Fairfax, Va.

Filed Mar. 7, 1990, Ser. No. 490,110
Int. Cl.[5] A44B *19/16*
U.S. Cl. 24—400 **11 Claims**

1. A plastic reclosable fastener with slider particularly suited for thermoplastic bags and the like comprising a pair of flexible plastic strips having separable fastener means extending along the length thereof comprising reclosable interlocking male and female profile elements on the respective strips, said strips including profiled tracks extending along the length thereof parallel to the male and female elements, said male and female elements having complimentary cross sectional shapes such that they are closed by pressing the bottom of the elements together first and then rolling the elements to a closed position toward the top thereof, a straddling slider on said tracks for closing or opening the reclosable fastener elements comprising an inverted U-shaped plastic member having a back for moving along the top edges of said tracks with side walls depending therefrom for cooperating with said tracks and extending from an opening end of the slider to a closing end, said side walls having a greater spacing at the opening end than the closing end, a separator finger depending from said back between said side walls and inserted between said tracks, said separator finger being shaped throughout the length thereof for first holding the top of the male and female elements open while the slider first presses the bottom of the elements together and then permitting the slider to press the top of the elements together while the slider moves in a closing direction, said slider having shoulders projecting inwardly from said depending side walls and shaped throughout the length thereof for cooperation with said depending separator finger in creating the rolling action in opening and closing said reclosable interlocking male and female profile elements.

5,007,144



SLIDE FASTENER SLIDER

Yasuharu Terada, Uozu, and Susumu Ishii, Kurobe, both of Japan, assignors to Yoshida Kogyo K. K., Tokyo, Japan

Filed Apr. 2, 1990, Ser. No. 502,733
Claims priority, application Japan, Mar. 31, 1989, 1-38538; Apr. 17, 1989, 1-44771
Int. Cl.[5] A44B *19/26*
U.S. Cl. 24—415 **7 Claims**

6. A slide fastener slider comprising a slider body including an upper wing and a lower wing jointed together at their one ends by a connecting neck and having respective inwardly directed lateral flanges, and a thermal insulating backing substantially coextensive with and secured to said lower wing, said backing having a hook at one end engageable in a recess formed in said neck and a hook at the opposite end engageable

in a recess formed in a rear end of said upper wing, said backing having a web surrounded by a continuous inwardly di-

rected peripheral flange, and said web defining with the outer surface of said lower wing an air accommodating pocket

END-LOCKING DEVICE FOR SLIDE FASTENERS

Sam H. Kim, 43-3, Myungju-dong, Kangneung-si, Kangwon-do, 210-30, Rep. of Korea

PCT No. PCT/KR89/00001, § 371 Date Sep. 18, 1989, § 102(e) Date Sep. 18, 1989, PCT Pub. No. WO89/06504, PCT Pub. Date Jul. 27, 1989
PCT Filed Jan. 18, 1989, Ser. No. 411,451
Claims priority, application Rep. of Korea, Jan. 18, 1988, 1988-348
Int. Cl.[4] A44B *19/38*
U.S. Cl. 24—433 **18 Claims**

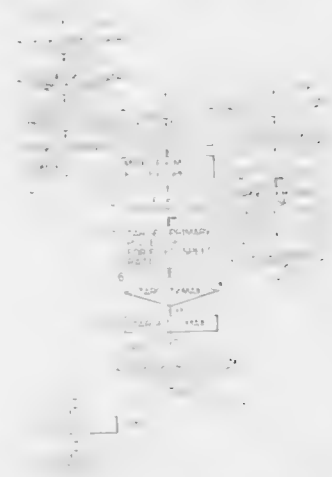
1. An end-locking device for slide fasteners comprising,
a socket terminal disposed at one end of a first row of zipper teeth and adapted to receive one end of a second row of zipper teeth through its mouth, said socket terminal including locking means provided with a recessed portion for interlocking engagement and mounted to pivot on said socket terminal in an opening formed therein; and
engaging means having a recessed portion for being brought into interlocking engagement with said locking means and located at the end of the second row of zipper teeth,
wherein said recessed portion of said locking means engages with said recessed portion of said engaging means to releasably lock the end of the second row of zipper teeth in said socket terminal when the end of the second row of zipper teeth is fully seated within said socket terminal, and the interlocking engagement between said portions is released when said locking means is caused to pivot.

5,007,146

PLASTIC PROFILE FASTENER

Daniel Meidan, 90 Elise Terrace, North York, Ontario, Canada M2R 2X1

Filed May 10, 1990, Ser. No. 521,493
Int. Cl.[5] A44B *21/00*; B65D *33/14*
U.S. Cl. 24—683 **14 Claims**



1. In a plastic profile fastener of the type comprising a female member having an axially elongated groove profile and a male member having a complimentary axially elongated male projection for engagement within said groove profile.
the improvement wherein said groove profile is provided with a plurality of male fastener elements and wherein said male projection is provided with a plurality of female fastener elements for engagement with said male elements when said male projection is engaged in said groove profile, said male and female fastener elements each presenting a cooperating surface component transverse to the axis of said fastener serving to limit the relative axial movement of said members.

CONTROL SYSTEM FOR STEPLESSLY VARIABLE POWER TRANSMISSION

Shoji Imai, and Yoshimi Kanemoto, both of Hiroshima, Japan, assignors to Mazda Motor Corporation, Hiroshima, Japan

Continuation of Ser. No. 302,198, Jan. 27, 1989, abandoned. This application May 22, 1990, Ser. No. 527,711
Claims priority, application Japan, Jan. 29, 1988, 63-18910
Int. Cl.[5] B60K *41/18*
U.S. Cl. 74—866 **8 Claims**

1. A steplessly variable power transmission comprising
a steplessly variable transmission mechanism in which a

speed ratio between an input shaft and an output shaft provided in the transmission is steplessly changed,

speed ratio control means for controlling the speed ratio in accordance with an engine operating condition,

load change detecting means for detecting a rate of change in an engine load when an engine load zone to which a value of the engine load belongs is changed from an intermediate zone to a specific zone other than the intermediate zone, and

speed ratio hold means for maintaining the speed ratio at a constant value determined in accordance with the rate of change in the engine load obtained through the load change detecting means and providing the speed ratio control means with control signals determining the constant value of the speed ratio

METHOD FOR MANUFACTURING A SOLID ELECTROLYTE CAPACITOR IN A CHIP STRUCTURE

Werner Schnabel, Nattheim, Fed. Rep. of Germany, assignor to Siemens Aktiengesellschaft, Berlin and Munich, Fed. Rep. of Germany

Filed Aug. 30, 1990, Ser. No. 574,796
Claims priority, application Fed. Rep. of Germany, Sep. 19, 1989, 3931263
Int. Cl.[5] H01G *4/00*
U.S. Cl. 29—25.03 **4 Claims**

1. A method of manufacturing a solid electrolyte capacitor including a capacitor chip and a carrier band, the chip comprising a cathode plate and an anode wire and the carrier band comprising an anode section as an anode terminal, a cathode section as a cathode terminal and an intermediate recess section connected between the anode and cathode sections, comprising the steps of:

(a) placing the capacitor chip in the recess section, and

(a1) electrically connecting the cathode plate to the cathode section,

(b) electrically connecting the anode wire to the anode section, and

(c) separating the anode section from the cathode section by cutting the carrier band between the anode section and the cathode section

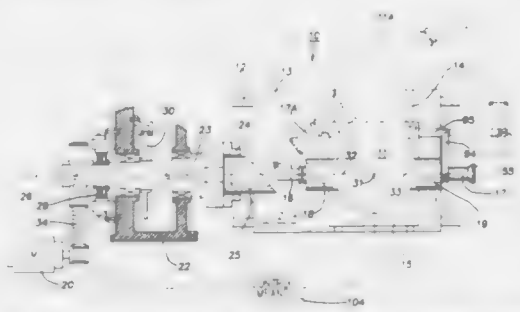
MACHINE TOOL TURRET

Nagle V. Gusching, Sidney, Ohio, assignor to The Monarch Machine Tool Company, Sidney, Ohio



Continuation-in-part of Ser. No. 263,041, Oct. 26, 1988, Pat. No. 4,856,153. This application Aug. 3, 1989, Ser. No. 389,268
Int. Cl.[5] B23B *7/04, 39/20*
U.S. Cl. 29—33 J **5 Claims**

1. A machine tool turret for a machine tool having a rotatable workpiece spindle rotatable about a c axis, comprising in combination:

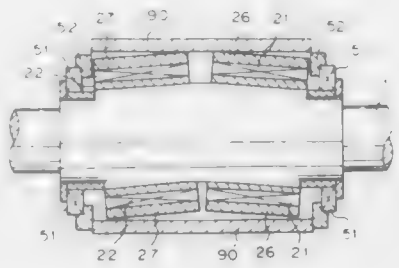
first and second tool spindles journaled on said turret for rotation about first and second tool axes, respectively;

means mounting said turret for compound movement of said tool spindles in an x-c plane defined by an x axis perpendicular to said c axis;

means to lock each said tool spindle against rotation for machining of a rotating workpiece by a non-rotating tool

in each said tool spindle, and for machining of a rotating or non-rotating workpiece by a rotating tool in each said tool spindle when unlocked and rotated; and

including drive means to rotate selectively each of said tool spindles;



said drive means being a single motor connectable to rotate alternatively each of said tool spindles.

VARIABLE-CROWN ROLL

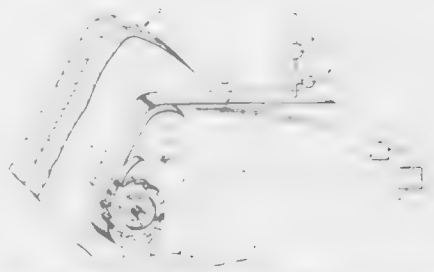
Atsushi Tomizawa; Susumu Inoue, both of Kobe, and Takeshi Masui, Nishinomiya, all of Japan, assignors to Sumitomo Metal Industries, Ltd., Osaka, Japan

Filed Nov. 9, 1989, Ser. No. 435,210
Claims priority, application Japan, Oct. 27, 1989, 1-280709
The portion of the term of this patent subsequent to Aug. 29, 2006, has been disclaimed.
Int. Cl.[5] B21B *13/02*
U.S. Cl. 29—116.2 **32 Claims**

1. A variable-crown roll comprising:

a curved arbor; and

a plurality of antifriction bearings which are mounted on said arbor, said bearings being symmetrically disposed with respect to the lengthwise center of said arbor, said bearings on one side of the lengthwise center of said arbor being symmetric with respect to said bearings on the other side of the lengthwise center.



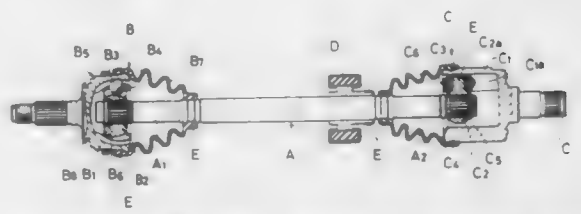
5,007,153

METHOD FOR TIGHTENING THREADED CONNECTORS

John K. Junkers, 7 Arrowhead La., Saddle River, N.J. 07458

Filed Jun. 29, 1989, Ser. No. 374,915
Int. Cl.[5] B23Q *17/20*
U.S. Cl. 29—407 **7 Claims**

1. A method of tightening a threaded connector including a bolt and a nut, comprising the steps of turning a nut on a bolt; continuously monitoring a relationship between a pressure applied for turning the nut and an angular distance of the turning of the nut; based on said monitored relationship between the pressure applied for the turning of the nut and the angular distance of the turning of the nut, determining a position of the nut when an elongation of the bolt starts; and thereafter turning the nut only over such an additional angular distance from the determined position, that a desired elongation of the bolt located below a yield point of the bolt is achieved.



5,007,154

METHOD OF ASSEMBLING A VEHICULAR DRIVING SHAFT

Yoshiharu Kamata; Nobuyoshi Nagatsuma; Mituharu Ozawa, and Hiroshi Yoshioka, all of Sayama, Japan, assignors to Honda Giken Kogyo Kabushiki Kaisha, Tokyo, Japan

Filed Mar. 15, 1989, Ser. No. 323,742
Claims priority, application Japan, Mar. 17, 1988, 63-63838; Mar. 18, 1988, 63-65536
Int. Cl.[5] B21D *39/03*
U.S. Cl. 29—430 **3 Claims**

1. A method of assembling a vehicular driving shaft in which a joint unit is attached to each of both ends of the driving shaft, said method comprising the steps of:

orienting the driving shaft vertically with respect to the ground;

conveying the driving shaft to a plurality of assembling stations while holding said driving shaft in a vertical posture in which an axial line of the driving shaft extends vertically with respect to the ground; and

assembling component parts of the joint units to the driving shaft, each of said component parts being assembled to the driving shaft at each of the stations while the driving shaft is held in said vertical posture.

5,007,155

LATCH PIN INSTALLATION APPARATUS AND METHOD

John J. Jordan, Freehold Township, Monmouth County, N.J., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Apr. 30, 1990, Ser. No. 516,575
Int. Cl.[5] B23P *11/00*
U.S. Cl. 29—434 **2 Claims**

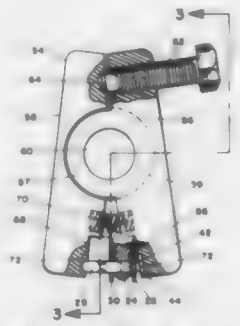
1. In apparatus for installing a pivot pin member in a latch in a shipping container having a cover portion and a base portion and a keeper member on one of the cover and base portions, the latch having

securing means for engaging the keeper member to hold the cover and base portions together,

lock means for tightening the securing means, and

aperture means in the securing means and the lock means for receiving the pivot pin member,

the improvement comprising



first and second working members, each having opposite first and second endportions,

the first endportions opposing one another and the second endportions opposing one another,

means pivotally interconnecting the working members at their midportions,

motive means carried by one of the working members for moving the first endportions in a direction away from one another and thereby moving the second endportions in a direction toward one another,

whereby the second endportions are operative to press the pivot pin member into the aperture means in the latch members,

the motive means including a bolt member threadedly received in the first endportion of the first working member and mounted for axial movement in a direction spaced from and normal to the axis of pivotal interconnection of the working members,

the bolt member operatively engaging the first endportion of the second working member to move the first endportions in a direction away from one another upon rotation of the bolt member, and

means biasing the second endportions in a direction away from one another,

the second endportions including opposing faces and means defining opposing cavities in the opposing faces for receiving opposite ends of the pivot pin member,

the cavities having open end portions transverse to the opposing faces and being arranged in opposing pairs in the opposing faces.

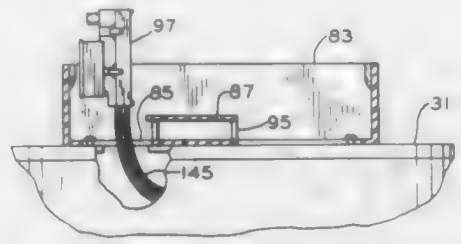
METHOD OF SELECTIVELY CONNECTING A SET OF WINDING MEANS FOR A DYNAMOELECTRIC MACHINE INTO AT LEAST TWO DIFFERENT ELECTRICAL CONFIGURATIONS

Jerome P. Hurtgen, Ft. Wayne, Ind., assignor to General Electric Company, Fort Wayne, Ind.

Division of Ser. No. 213,720, Jun. 30, 1988, Pat. No. 4,880,391. This application Jul. 19, 1989, Ser. No. 381,854



Int. Cl.[5] H02K *15/00*

U.S. Cl. 29—596 **19 Claims**

11. A method of selectively connecting a set of winding means for a dynamoelectric machine into at least two different electrical configurations with the winding means being adapted for excitation upon the energization of the dynamoelectric machine, the dynamoelectric machine including means for housing at least the winding means and having at least one opening therein, a conduit box associated with the housing means and having at least one aperture disposed so as to communicate with the at least one opening, each winding means having a plurality of leads adpated to be connected to each other and to a power source in the at least two different electrical configurations and with the leads passing through the at least one opening and the at least one aperture in part into the conduit box, a mounting table in the conduit box and having an abutment surface thereon, a terminal block having a plurality of connection apertures therein, and a plurality of lead terminations, the method comprising the steps of:

connecting the lead terminations to the leads of the winding means passed into the conduit box, repsectively;

disposing the terminal block in a preselected orientation at least adjacent the mounting table in the conduit box;

releasably inserting each lead termination into a predetermined one of the connection apertures in the terminal block while maintaing the terminal block at least generally in the preselected orientation thereof;

moving the terminal block from the preselected orientation thereof into another preselected orientation in overlaying engagement with the abutment surface of the mounting table, and

releasably engaging the terminal block in its another preselected orientation to the mounting table at least upon the occurrence of the moving step.

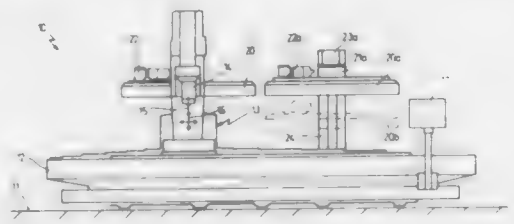
MACHINE TOOL



Hans-Henning Winkler, Tuttlingen, and Eugen Rütschle, Mühleim, both of Fed. Rep. of Germany, assignors to Chiron-Werke GmbH & Co. KG, Tuttlingen, Fed. Rep. of Germany

Filed Sep. 6, 1990, Ser. No. 578,875

Claims priority, application Fed. Rep. of Germany, Sep. 9, 1989, 3930071

Int. Cl.[5] B23Q *3/157*

U.S. Cl. 29—568 **5 Claims**

1. A machine tool comprising:

a stationary machine bed;

a support;

means for displacing said support relative to said machine bed within a predetermined operating area;

a spindle stock arranged on said support for being displaced therewith, said spindle stock having a first receptacle for receiving a detachable toolholder magazine therein, said first receptacle being provided with first transfer means for transferring said toolholder magazine and being provided with first connector means for feeding energy to said toolholder magazine;

a stationary rack arranged within said operating area, said rack having a plurality of second receptacles, said second receptacles being each provided with second transfer means for transferring a toolholder magazine and being each provided with second connector means for feeding energy to said toolholder magazine;

a plurality of toolholder magazines, each having transfer elements for being transferred between said first receptacle on said spindle stock and one of said second receptacles on said rack, said toolholder magazines having each individual drive means for transporting toolholders within said toolholder magazine, said drive means being linked to third connectors mating said first or said second connector, respectively, when said toolholder magazine is inserted into said first or said second receptacle, respectively

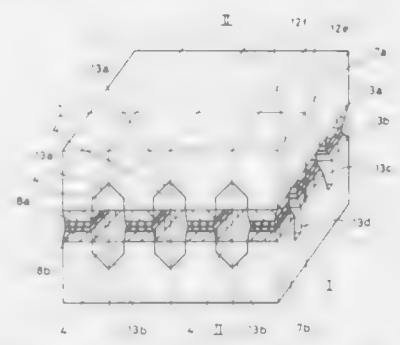
METHOD OF MANUFACTURING MAGNETIC HEADS



Kazuo Ino, Matsubara; Yoshiaki Shimizu, Minoh; Hiroyuki Okuda, Daitoh; Kousou Ishihara, Daitoh, and Takashi Ogura, Daitoh, all of Japan, assignors to Sanyo Electric Co., Ltd., Osaka, Japan

Filed Feb. 8, 1989, Ser. No. 307,654

Claims priority, application Japan, Feb. 9, 1988, 63-28091; May 31, 1988, 63-133608; Jul. 27, 1988, 63-187727

Int. Cl.[5] G11B *5/42*

U.S. Cl. 29—603 **16 Claims**

1. A method of manufacturing a magnetic head having a magnetic gap between a pair of magnetic core halves abutted with each other through a nonmagnetic material, said method comprising the steps of:

preparing first and second magnetic core half members of ferromagnetic oxide having gap forming surfaces to be abutted with each other for defining said magnetic gap;

selectively forming a ferromagnetic thin film of a ferromagnetic metal material on said gap forming surface of at least said second magnetic core half member, said ferromagnetic thin film being so formed as (a) to expose a portion to be provided with a track width regulating groove and at least one of a coil groove and a joining member receiving groove in said gap forming surface of said first magnetic core half member and (b) to expose, in said gap forming surface of said second magnetic core half member, a portion to be provided with a track width regulating groove and a portion to be opposite to said at least one of said coil groove and said joining member receiving groove to be provided on said gap forming surface of said first magnetic core half member;

performing mechanical working on said exposed portion of said gap forming surfaces therein to provide said track width regulating groove and said at least one of said coil groove and said joining member receiving groove in said first magnetic core half member and to provide said track width regulating groove in said second magnetic core half member; and

abutting said first and second magnetic core half members between said gap forming surfaces to join the same with each other.

METHOD OF MANUFACTURING AN ELECTRICAL COMPONENT, E.G. A DIGITAL CONTACTING ENCODER

Kenneth Brown, Evansville, Ind., and Richard E. Riley, Riverside, Calif., assignors to Hamilton Standard Controls, Inc., Farmington, Conn.

Filed Mar. 29, 1989, Ser. No. 329,737

Int. Cl.[5] H01H *11/00*

U.S. Cl. 29—622 **7 Claims**

1. A method of manufacturing an electrical component which component includes

a rigid base having an exterior side and an interior side;

at least two, externally exposed electrical contacts on the exterior side of said base, one of them being a common contact and the other being a strip contact;

an electrical signal varying element, including

a relatively rigid substrate having a top side and an underside, and

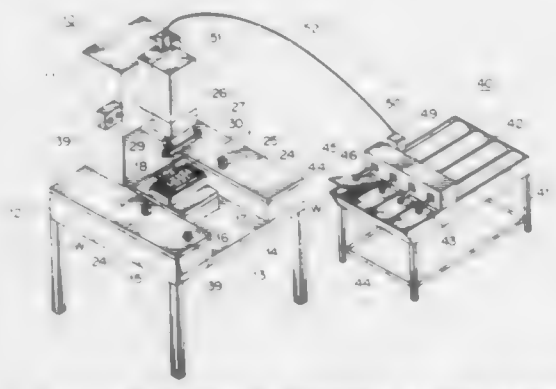
at least one, longitudinally extended strip of signal affecting, conductive material located on the top side of said substrate;

a movable, bridging member electrically connected to said common contact and associated with said strip, movably sweeping along said strip causing an electrical signal imposed across said common contact and said strip contact to vary due to the changing relative position of said bridging member with respect to the length of said longitudinally extended strip;

comprising the steps of:

(a) forming a longitudinally extended, affixed conductive layer on the interior side of said base in physical and electrical connection with said strip contact, with said conductive layer providing a serial link in said conductive path, the presence of said conductive layer allowing greater tolerance in positioning said strip in relation to said strip contact;

(b) interfacing said conductive layer to the underside of said substrate, with the conductive layer located between said substrate and said base substantially coincident in alignment with said longitudinally extended strip, so that said conductive layer is electrically connected with said strip and said strip contact, and so that there is only one conductive path from said external strip contact to said strip within the component, the presence of said conductive layer allowing relatively great latitude in the alignment and placement of said strip with respect to said external strip contact; and



(c) joining said substrate and said base together and using said conductive layer so that said conductive layer provides a serial link in the only conductive path from said external strip contact to said strip.

APPARATUS FOR PRESS-INSTALLING WIRES

Masahiko Ishida, Kosai; Nobuaki Yamakawa, and Masahiro Shiida, both of Shizouka, Japan, assignors to Yazaki Corporation, Tokyo, Japan

Filed Jul. 12, 1989, Ser. No. 378,673
Claims priority, application Japan, Jul. 14, 1988, 63-173693
Int. Cl.[5] H01R *43/04*
U.S. Cl. 29—753 **1 Claim**

1. A wire press-installing apparatus for securely seating wires into multiple rows of receiver terminals erected at a predetermined pitch on a base of a joint block, comprising:

a receiver block means for securely holding the joint block thereon;

a table means on which the receiver block means is mounted and means for intermittently moving the receiver block means by a distance equal to the pitch of the receiver terminals on the joint block;

a ram means disposed above the table means and opposite the receiver block means for vertically moving a wire press-installing blade toward and away from the receiver block;

wire axis aligning jig means mounted on the table for temporarily holding the wire such that the wire faces a row of receiver terminals arranged on the base of the joint block;

a plurality of containers, each having a cover and containing specifically rated wires therein; and

a means for selecting one of the plurality of containers as having the next wire to be installed in the receiver terminals, said cover being openable in response to a signal from the selecting means and in response to the ram means having moved the distance equal to the pitch of the receiver terminals on the joint block.

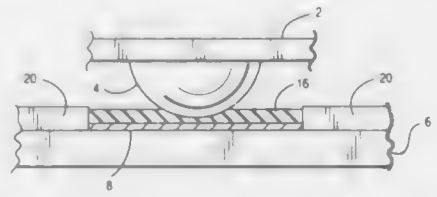
METHOD AND DEVICE FOR PLACING COMPONENTS ON A SUPPORT

Adrianus A. R. Weeber, Alkmaar, Netherlands, assignor to U.S. Philips Corporation, New York, N.Y.

Filed Jan. 3, 1990, Ser. No. 460,460
Claims priority, application Netherlands, Jan. 6, 1989, 8900027
Int. Cl.[5] H05K *3/30*; B23P *19/00*
U.S. Cl. 29—839 **14 Claims**

1. A method of placing components on a support, in which within a placement cycle a number of components are picked up from a presentation position in which the components are in a first array of a given spacing in a given direction by means of a pick-up device comprising a number of pick-up elements in a second array in a second spacing in the given direction, after which the pick-up device is moved above the support and all the pick-up elements are positioned one by one above the desired position on the support by the relative movement of the pick-up device with respect to the support and the relevant component is placed in this position in a third spacing of a third array, characterized in supplying the components positioned in said first array in tray packings, picking up the components one by one from the different tray packings to place them in the second array and then placing the components one by one on the support in said third array wherein the spacings of the first, second and third arrays differ.

5,007,163



NON-DESTRUCTURE METHOD OF PERFORMING ELECTRICAL BURN-IN TESTING OF SEMICONDUCTOR CHIPS

Keith R. Pope, and Gustav Schrottke, both of Austin, Tex., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Apr. 18, 1990, Ser. No. 510,497
Int. Cl.[5] H05K *3/34*
U.S. Cl. 29—840 **6 Claims**

1. A method of temporarily bonding electronic chips to metallized pads on a circuitized substrate comprising the steps of:

choosing a first metal indium and a second metal gallium as a pair of metals for spontaneously forming a eutectic molten mixture at a temperature in the range of from about 10 deg. C. to about 30 deg. C.;

providing a solder dam at each substrate pad;

depositing a first of said pair of metals on substrate pads;

depositing a second of said pair of metals over chip terminal bumps; and

bringing chip terminal bumps and metallized pads into contact.

METHOD AND APPARATUS FOR PRODUCING LINEAR BODY WITH WATERPROOF PLUG

Sanae Kato, Gotenba, Japan, assignor to Yazaki Corporation, Tokyo, Japan

Filed Sep. 8, 1989, Ser. No. 404,534
Claims priority, application Japan, Sep. 12, 1988, 63-226394
Int. Cl.[5] B23P *19/00*
U.S. Cl. 29—854 **19 Claims**

1. A method for mounting a waterproof plug to the front end of a covered electric wire, comprising the steps of:

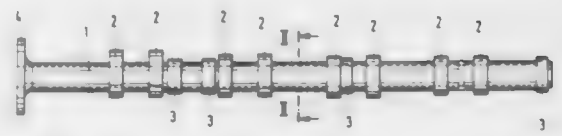
feeding waterproof plugs to a first position of a transfer path one by one from a magazine in such a manner that the opening of each waterproof plug is maintained parallel with said transfer path as each waterproof plug is fed to said first position;

feeding a covered electric wire to a mounting position at a second position of said transfer path in an uncovered state of the front end thereof; and

transferring the waterproof plug from the first position to the second position and inserting the uncovered end of the electric wire into the opening of the waterproof plug.

5,007,165

METHOD OF PRODUCING A CAM SHAFT



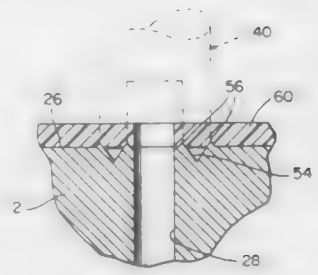
Miroslan Podhorsky, Elisabethstrasse, Fed. Rep. of Germany, assignor to Balckeürr Aktiengesellschaft, Ratingen, Fed. Rep. of Germany

Filed Aug. 30, 1990, Ser. No. 575,306
Claims priority, application Fed. Rep. of Germany, Sep. 2, 1989, 3929179
Int. Cl.[5] B23P *15/00*
U.S. Cl. 29—888.1 **2 Claims**

1. A method of producing a member that has a core pipe upon which are secured, via expansion of said core pipe, components that are spaced from one another and have a prescribed position on said core pipe, with said expansion of said core pipe being effected by introducing a hydraulic fluid into said core pipe said method including the further steps of:

providing components that are made of a ductile material selected from the group consisting of spheroidal graphite iron and sintered materials.

subjecting surface portions of said components to a mechanical abrasion; and



melting said surface portions of said components via a controlled laser beam in such a way as to first slightly reduce an adhesive pressure between said components and said core pipe as a consequence of said melting of said surface portions, and subsequently, after hardening of said melted surface portion and due to temperature equalization in said components and said core pipe, to increase said adhesive pressure to a higher value.

5,007,166

METHOD OF DECREASING AIR/FUEL LEAKAGE IN A CARBURETOR

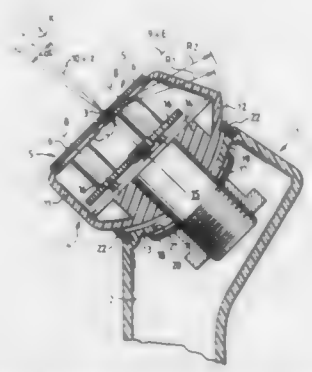
Gary H. Erb, 513 N. Cherry, O'Fallon, Ill. 62269

Filed Nov. 29, 1989, Ser. No. 442,623
Int. Cl.[5] B23P *15/00*; B01D *47/00*
U.S. Cl. 29—888.011 **8 Claims**

1. A method of decreasing air/fuel leakage in a carburetor including a main body defining at least one air-fuel mixture intake passage extending therethrough and a planar mounting face upon which a main jet plate is mounted with a planar face of said jet plate closely opposing said mounting face and a gasket sheet disposed and clamped between said faces and having a plurality of openings therethrough communicating with a plurality of corresponding air and fuel passage ends, each having a given diameter, opening through said faces in registry with other, said method comprising:

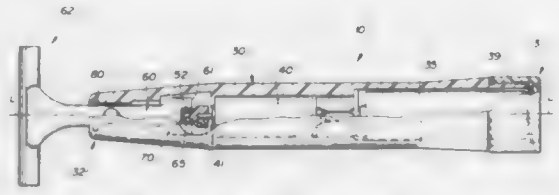
(a) separating said main body from said jet plate and said gasket sheet;

(b) forming circular grooves in one of said faces about the corresponding passage ends and forming at least one circular raised ridge on said one face substantially concentric with and radially adjacent each groove; and



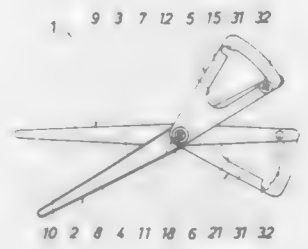
(c) reassembling said main body and said jet plate with said gasket sheet clamped therebetween, said circular raised ridges forming zones of increased pressure engagement between said one face and said gasket sheet about the corresponding passage ends by penetrating said circular raised ridges into said gasket sheet.

5,007,167
BLADE MODIFICATION TOOL AND PROCESS
Jamie R. Hill, 1325 SE. Fourth St., Cape Coral, Fla. 33904
Filed Dec. 4, 1989, Ser. No. 445,375
Int. Cl.[5] B27B *11/004*
U.S. Cl. 29—889.1 6 Claims



6. A process for converting a helicopter rotor blade to a shorter, approved length comprising the steps of:
installing a blade bolt through a pin bolt support bracket located on a horizontal tubular base and the base end of said rotor blade;
locating the leading edge of said rotor blade into three "V" shaped support brackets;
installing lateral support arms on each side of said rotor blade and tightening the adjusting screws to a firm grip on said rotor blade;
strapping the out board end of said rotor blade to said base to secure portion of blade to be cut off; and
cutting off out board twenty four inches of said rotor blade.

5,007,168
ELECTRIC DRY SHAVING APPARATUS WITH A MOVABLE SHAVING HEAD ARRANGEMENT
Werner Messinger, Kronberg; Karl Trölltsch, Frankfurt am Main, and Bernd Tewes, Wiesbaden, all of Fed. Rep. of Germany, assignors to Braun Aktiengesellschaft, Frankfurt, Fed. Rep. of Germany
Filed Dec. 20, 1989, Ser. No. 453,718
Claims priority, application Fed. Rep. of Germany, Dec. 24, 1988, 3843936
Int. Cl.[5] B26B *19/20, 19/14, 19/16, 19/44*
U.S. Cl. 30—43 19 Claims



1. A dry shaving apparatus comprising a housing, a shaving head movably carried on said housing, said shaving head including at least one shaving assembly, said shaving assembly including a circular upper cutter and a rotary lower cutter, said lower cutter having an axis of rotation aligned at right angles to a shearing plane (E) extending parallel to the outer surface of said upper cutter, said shaving head having an axis of symmetry intersecting said shearing plane (E) at right angles in the geometric center of said shaving head, and structure supporting said shaving head on said housing so that said geometric center is provided as a stationary pole for said shaving head axis of symmetry which is movable with said shearing plane (E) in any direction, relative to the housing.

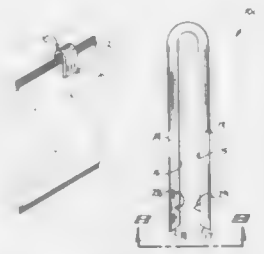
VIBRATING RAZOR
Vincent C. Motta, West Norwalk, Conn., assignor to Warner-Lambert Company, Morris Plains, N.J.
Filed Dec. 11, 1989, Ser. No. 448,779
Int. Cl.[5] B26B *19/28, 19/02, 21/14*
U.S. Cl. 30—45 34 Claims



1. An electric vibrating razor comprising:
an electric motor with a rotatable shaft;
a battery for powering said electric motor;
a substantially hollow handle which substantially encases said electric motor and said battery wherein said handle has a longitudinal axis;
a solid shaver head pivotally attached to said handle wherein said shaver head has a distal end with means for supporting a cartridge, and a proximal end;
means for coupling said proximal end of said shaver head to said rotatable shaft.

5,007,170
SCISSORS FOR BOTH RIGHT AND LEFT HAND USE
Tatsushige Mayama, Osaka, Japan, assignor to NT Incorporated, Osaka, Japan
Division of Ser. No. 363,880, Jun. 9, 1989, abandoned. This application Apr. 25, 1990, Ser. No. 513,019
Int. Cl.[5] B26B *13/20*
U.S. Cl. 30—232 5 Claims

1. Scissors comprising:
a front blade having upper and lower cutting edges;
a rear blade having upper and lower cutting edges;
connecting means pivotally connecting the front blade and the rear blade for slidable pivoting movement relative to each other;
a front handle having a first finger receiving portion thereon, and
a rear handle having a second finger receiving portion thereon,
characterized in that the connecting means engages not only the front and rear blades but also the front and rear handles so that the front and rear handles and the first and second finger receiving portions provide thereon respectively are pivotal on the connecting means.

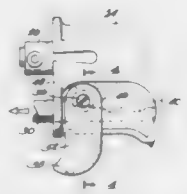
BAG OPENER APPARATUS
John H. Horning, Jr., 51934 Lily Rd., South Bend, Ind. 46637
Filed May 7, 1990, Ser. No. 519,810
Int. Cl.[5] B67B *7/00*
U.S. Cl. 30—294 1 Claim



1. A bag opener apparatus comprising,
a "U" shaped body, the "U" shaped body including a first leg spaced from and parallel to a second leg in a first position and in an unparallel relationship in a second position when the first and second legs are squeezed together relative to one another, and
the first and second legs joined together, including an elongate arcuate intersection, the "U" shaped body formed of a memory retentive deformable material, and
the first leg including a first interior surface, and the second leg including a second interior surface, wherein the first and second interior surfaces are parallel relative to one another in the first position, and
the first and second legs coextensively aligned relative to one another in the first position, and
knife means mounted to the first interior surface to effect severing of a bag directed between the first and second interior surfaces, and
wherein the knife means includes an elongate knife defined by a "V" shaped cross-sectional configuration, and
wherein the first leg includes a first side edge spaced from and parallel to a second side edge, and the "V" shaped knife aligned with the first interior surface at the first side edge and extending above the first interior surface at the second side edge a predetermined height, and
including an elongate groove defined by a "V" shaped cross-sectional configuration aligned with the knife, wherein the groove is formed within the second interior surface, and the knife and the groove are aligned relative to one another, and
wherein the first leg includes a first beveled terminal end edge, and the second leg includes a second beveled terminal end edge, wherein the first and second beveled end edges are in confronting relationship to receive the bag therebetween, and
wherein the groove is defined by a predetermined depth, the predetermined depth less than that defined by the predetermined height of the knife adjacent the second side edge.

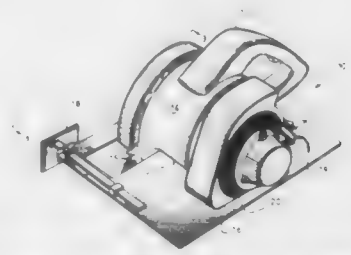
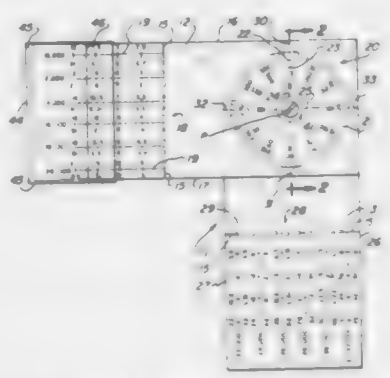
QUICK CHANGE GUIDE SHOE
Bernhard Palm, Brookfield, Wis., assignor to Milwaukee Electric Tool Corporation, Brookfield, Wis.
Filed Jun. 13, 1990, Ser. No. 537,474
Int. Cl.[5] B27B *11/02*
U.S. Cl. 30—377 2 Claims



1. A power saw having a body including a nose section and including,
a reciprocating saw blade projecting from said nose section,
a post mounted in said nose section for slideable movement generally parallel to said saw blade,
a guide shoe mounted for limited pivotal movement on said post,
a plurality of transverse grooves spaced along the length of said post,
a lock pin rotatably mounted in said nose section transverse and spaced from the axis of said post,
said pin being rotatable between a lock position and a release position and having a portion engageable with whichever of said grooves is positioned adjacent the pin,

a portion of said pin being shaped to clear and not engage said post when said pin is rotated to said release position,
an end of said pin projecting from said nose section,
and a lever mounted on said end of said pin for actuating said pin.

5,007,173
GASOLINE ENGINE POWERED HAND-HELD CIRCULAR SAW
Robert E. Rush, 560 Mellon Bridge Rd., Oxford, Ala. 36203
Filed Jun. 14, 1990, Ser. No. 537,800
Int. Cl.[5] B23D *45/16;* B25F *11/00*
U.S. Cl. 30—391 5 Claims



1. A gasoline engine powered hand-held circular saw, comprising:
(a) a casing having a front, a top, and a bottom;
(b) a fuel tank disposed substantially on said front of said casing;
(c) a circular saw blade disposed substantially within said casing;
(d) an internal combustion engine disposed substantially along side said circular saw blade within said casing, said internal combustion engine having a crankshaft with an end, said circular saw blade being connected to said end of said crankshaft of said internal combustion engine; and
(e) a handle disposed substantially on said top of said casing so that the saw can be easily handled and used.

TOPOGRAPHIC MEASURING DEVICE

Robert J. Cook, 316 W. Prospect, Apt. 209, Fort Collins, Colo. 80526

Filed Jan. 22, 1990, Ser. No. 468,233
Int. Cl.[5] H01L 7/10
U.S. Cl. 33—1 SD [redacted] Claims

1 A measuring device for topographic sheets having different distance scales comprising:

transparent top and bottom arms pivotally connected together to move relative to one another about a pivot, each of said arms having a pair of longitudinal edges,

a plurality of different distance scales extending along each of said arms, each of said distance scales extending parallel to the longitudinal edges of the associated arm and having a series of spaced graduation lines arranged perpendicular to the longitudinal edges of the associated arm,

said top arm carrying a protractor with a center, said protractor having a protractor line with 0 to 180 indicia,

said bottom arm having pointer means adjacent and operatively associated with said protractor, said pointer means being offset 90 degrees on the bottom arm with respect to the orientation of said protractor line on said top arm when said top and bottom arms are superposed on one another,

one of said distance scales on one of said arms being used to measure the distance between two selected points on a selected one of said topographic sheets by the placement of said one distance scale for that sheet so that both of said points intersect said selected distance scale,

the other of said arms being rotated until a selected line associated with said other arm is parallel to a reference line to provide an indication of the angle formed by said one distance scale with said reference line and readable on said protractor.

SIMPLY-CONSTRUCTED INSTRUMENT FOR MEASURING HORIZONTAL LINE, VERTICAL LINE AND ANGLES

Ming-Chuan Huang, P. O. Box 55-1670, Taipei 10477 , Taiwan

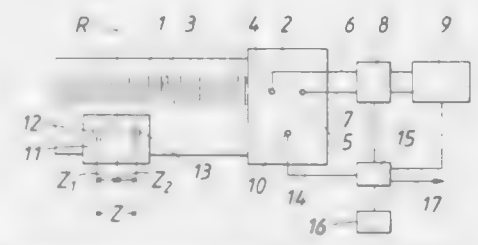
Filed Oct. 1, 1990, Ser. No. 591,242
Int. Cl.[5] G01C 9/20
U.S. Cl. 33—377 4 Claims

1 An instrument for measuring angles comprising:

a casing generally square shaped and formed with four sides walls, a transparent covering plate and a base plate, said casing forming an inner jacket and two axial lines crossing each other at a center of said transparent covering plate of said casing, of which one axial line is perpendicular to two vertical side walls but parallel to the other two horizontal side walls, and the other axial line is perpendicular to the two horizontal side walls but parallel to the two vertical side walls;

a coloured liquid filled in said inner jacket of said casing; and a rotating disc generally made of transparent material pivotally mounted at a center of said transparent covering late of said casing including an upper half circle portion above a central diametrical line passing the center of said covering plate of said casing radially formed with a plurality of angular graduations in term of degrees and a lower half circle portion below the central diametrical line formed with two vertical columns parallel with each other, said two columns respectively formed with a plurality of horizontal graduations of which any two corresponding horizontal graduations of said two columns are interpolated to form a reference line between the two horizontal graduations parallel to said diametrical line,

whereby upon a rotation of said rotating disc about a pivot formed at the center of said casing to allow said reference line between said two horizontal graduations to be parallel



to a liquid level of said coloured liquid, an angle an be obtained by matching the angular graduation with one of said axial lines formed on said covering plate when said casing is laid on or coincided with a plane to be measured.

INCREMENTAL MEASURING SYSTEM

Heinz Rieder, Oberndorf, and Max Schwaiger, Ostermiething, both of Austria, assignors to RSF-Elektronik Gesellschaft m.b.H., Tarsdorf, Austria

Filed Jan. 22, 1990, Ser. No. 467,945
Claims priority, application Austria, Feb. 3, 1989, 219/[redacted]
Int. Cl.[5] G01B 7/02, 11/02
U.S. Cl. 33—706 5 Claims

1 In an incremental measuring system comprising.

a scale member provided with a scale consisting of a sequence of scale increments and further provided with a plurality of reference marks spaced apart along said scale,

a scanning unit mounted to perform relative to said scale member a non-contacting scanning movement in opposite directions along said scale and comprising a plurality of scale-scanning sets for scanning said scale and for producing analog measured-value signals in response to the scanning of said scale, and a reference mark scanning set for scanning said reference marks and for producing a reference mark signal in response to the scanning of said reference marks, and

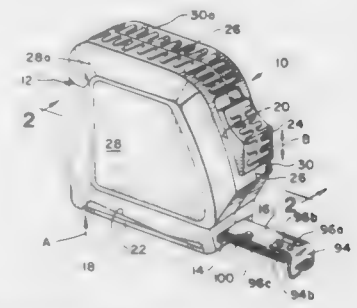
evaluating means for receiving said measured-value signals and for deriving from said measured-value signals digital countable signals and a direction signal indicating the direction of said scanning movement, said evaluating means comprising counting means for counting said countable signals in a sense depending on said direction signal and for generating a count indicating the position of said reference mark scanning relative to said scale, and an evaluating circuit for receiving said reference mark signal and for generating a reference pulse when said counting means indicate that said scale member is being scanned by said reference mark scanning set at a reference point, which registers with a predetermined one of said scale increments and is spaced along said scale from each of said reference marks,

the improvement comprising

at least one reference mark carrier releasably secured to said scale member,

said reference marks comprising at least one pair of first and second reference marks on said carrier and spaced along said scale,

selecting means for defining for said reference point on said carrier a location which is disposed between said first and second reference marks and is spaced first and second distances from said first and second reference marks, respectively, which selecting means comprise memory means for storing said first and second distances, and wherein



said evaluating circuit comprises a pulse shaper stage for generating said reference pulse and a control circuit for indicating in dependence on said direction signal and on said reference mark signal that said reference mark scanning set is scanning one of said first and second reference marks by a scanning movement toward the other of said first and second reference marks, and for causing said pulse shaper stage to generate said reference pulse when said counting means indicate that said reference mark scanning set has moved from said one reference mark toward the other over said one of said stored distances.

MEASURING TAPE DEVICE

Robert J. Dewire, Naperville, and Walter A. Kozlowski, Schaumburg, both of Ill., assignors to Sears, Roebuck & Co., Chicago, Ill.

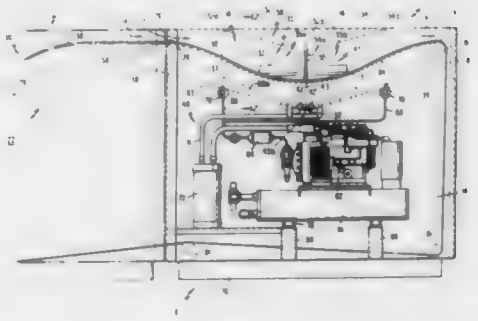
Filed Jun. 29, 1989, Ser. No. 374,005
Int. Cl.[5] G01B 3/10
U.S. Cl. 33—767 10 Claims

1. A measuring tape device, comprising.

a casing having an aperture through which a coilable measuring tape can be extracted and retracted;

a coilable measuring tape disposed in the casing with a distal end projecting from the aperture;

a first brake mechanism mounted on and normally recessed within the bounds of the casing for normally applying a controlled drag on the tape which allows the tape to be extracted or retracted against the drag to any given length and held at said length and being selectively operable to release the normal application of the controlled drag; and



a second brake mechanism mounted on the casing and being selectively operable for applying a positive lock on the tape greater in magnitude than the drag of the first brake mechanism to prevent accidental extraction or retraction of the tape.

5,007,179

COLD AIR LOCK VAPOR SEAL FOR PROCESS SOLVENT VAPOR RECOVERY AND CONTROL

Joel E. Rodgers, Sr., Convent Station, N.J.; Ambrose J. Schmitz, Lake Barrington, Ill., and Alton D. Romig, Mine Hill, N.J., assignors to Allied-Signal Inc., Morris Township, Morris County, N.J.

Filed Sep. 21, 1989, Ser. No. 410,216
Int. Cl.[5] F26B 3/00, 21/06
U.S. Cl. 34—22 37 Claims

23. A method of limiting outflux of a solvent vapor from a degreaser containing a supply of solvent through which de-

greaser articles to be degreased are conveyed from an entrance end of the degreaser for discharge through an exit end, comprising the steps of:

(a) conveying said articles from the entrance end into contact with at least one of said solvent supply or a vapor zone thereof;

(b) directing said articles from contact with the solvent supply or vapor thereof through the conveyor exit end;

(c) causing said articles to pass through a conveyor flow path in said exit end provided with chilled air in a section of the flow path which is elevationally lower than flow path sections in said exit end respectively disposed upstream and downstream from the chilled air section; and

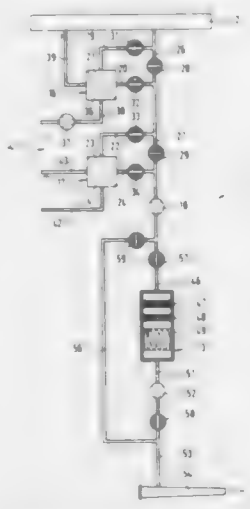
(d) collecting solvent liquid condensed within the chilled air section.

28. The method of claim **23**, wherein said articles pass into an inlet of the conveyor flow path which is elevationally above a vapor zone within the degreaser in communication with the inlet.

5,007,180

METHOD OF AND AN APPARATUS FOR THE SEPARATION OF CONDENSABLE HARMFUL SUBSTANCES

Michael Christ, Stuttgart, and Wolfgang Teichmann, Filderstadt, both of Fed. Rep. of Germany, assignors to Sueddeutsche Kuehlerfabrik Julius Fr. Behr GmbH & Co. KG, Stuttgart, Fed. Rep. of Germany



PCT No. PCT/EP88/00807, § 371 Date Jun. 12, 1989, § 102(e) Date Jun. 12, 1989, PCT Pub. No. WO89/03499, PCT Pub. Date Apr. 20, 1989

PCT Filed Sep. 7, 1988, Ser. No. 375,011

Claims priority, application Fed. Rep. of Germany, Oct. 10, 1987, 3734388

Int. Cl.[5] F26B *3/00*

U.S. Cl. 34—32 **18 Claims**

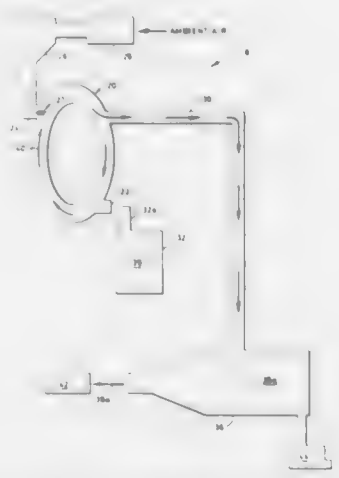
1. A method of separating condensable harmful substances and solid particles from a process gas or waste air, comprising the steps of:

pre-filtering a warm waste air in a first heat-exchanger stage by cooling this air with a first cooling medium to below the dew point of first condensable harmful substances and dispersed solid particles to produce a first condensate containing impurities, discharging the first cooling medium for heat recovery and heating the process gas, and extracting the first condensate containing impurities;

pre-filtering said warm waste air in a following second heat-exchanger stage by cooling this air with a second cooling medium to below the dewpoint of second condensable harmful substances to produce a second condensate containing impurities, and extracting the second condensate containing impurities; and

mechanically final filtering the waste air in a third stage after it has been cleansed twice in said first and said second stage.

5,007,181



DEAGGLOMERATING DIRECT-FIRED FLASH DRYER FOR DRYING STIR-IN PHOSPHORS AND METHOD OF USING SAME

Douglas M. Jackson, Monroeton, and John A. Arbie, Sr., Towanda, both of Pa., assignors to GTE Products Corporation, Stamford, Conn.

Filed Jan. 22, 1990, Ser. No. 473,778

Int. Cl.[5] F26B *17/00*

U.S. Cl. 34—57 R **9 Claims**

1. An improved direct-fired flash dryer for drying stir-in halophosphate phosphor to a deagglomerated state, comprising:

a glass toroidal drying chamber;

a teflon-coated feeder for transferring a wet phosphor cake from filtering means to said drying chamber;

an inlet blower to provide a gaseous stream to said drying chamber for circulation therein;

means for heating said gaseous stream;

a phosphor collector connected by glass conveying means to said drying chamber for collecting said phosphor; and

and exhaust fan connected by glass conveying means to said collector to draw said gaseous stream through said drying chamber and said collector.

5,007,182

BODY DRYER

Sam Fishman, 6 Amberly Ct., Marlboro, N.J. 07746, and Michael J. Marchese, 12812 Willoughby La., Bayonet Point, Fla. 34667

Filed Jan. 31, 1990, Ser. No. 473,019

Int. Cl.[5] F26B *19/00*

U.S. Cl. 34—90 **24 Claims**

1. An apparatus for drying a user's body comprising:

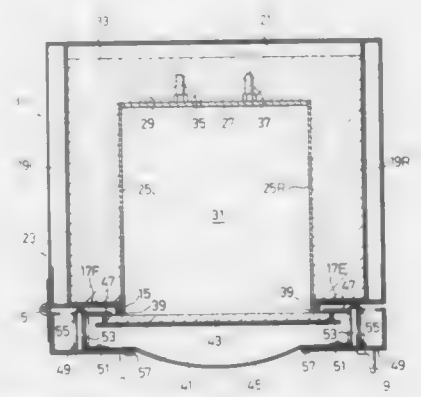
a support frame;

a platform means dimensioned to permit a user to stand on a surface thereof and supported on the frame, the platform means being formed with an upwardly extending surface portion positioned to bear against and cause the toes of the user to spread, said platform means being formed with aperture means therethrough permitting airflow therethrough to the body of the user standing thereon; and

a fan means mounted under the platform means for directing air through said aperture means.

5,007,183

VACUUM DRIER APPARATUS



Nobutoshi Kobayashi, and Tetsuo Murakami, both of Tokyo, Japan, assignors to Nippon Scientific Co., Ltd. and Kusumoto Chemicals Co., Ltd., both of Tokyo, Japan

Filed Sep. 18, 1990, Ser. No. 583,999

Claims priority, application Japan, Sep. 20, 1989, 1-242137

Int. Cl.[5] E26B *13/30*; **E06B** *7/28, 9/00*

U.S. Cl. 34—92 **5 Claims**

1. A vacuum drier apparatus, comprising:

a vacuum drying chamber having a vacuum drying space for performing a vacuum drying on an object to be dried therein, the vacuum drying space having an opening section; and

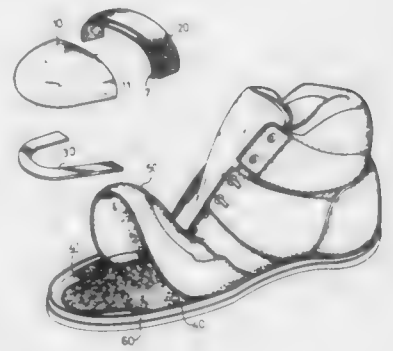
an openable door having an opening window, which is provided in front of the vacuum drying chamber to close off the opening section of the vacuum drying space, the door including:

a transparent glass plate provided on a rear side of the opening window facing toward the opening section of the vacuum drying space, which seals off the opening section when the door is closed;

a transparent protection member provided on a front side of the opening window facing away from the opening section of the vacuum drying space, in front of the glass plate; and

elastic supporter means located between the glass plate and the protection member, for supporting the glass plate and the protection member with respect to each other, such that the glass plate can be pressed tightly to seal off the opening section of the vacuum drying space, while the protection member can be pushed away from an edge of the front side of the opening window by an external pressure exerting on the protection member.

5,007,184



SAFETY SHOE

Chien A. Lee, Room 704, No. 592, Lin Sen N. Rd., Taipei, Taiwan

Filed Jun. 21, 1989, Ser. No. 369,121

Int. Cl.[5] A43B *23/08*

U.S. Cl. 36—77 R **2 Claims**

1. A safety shoe comprising:

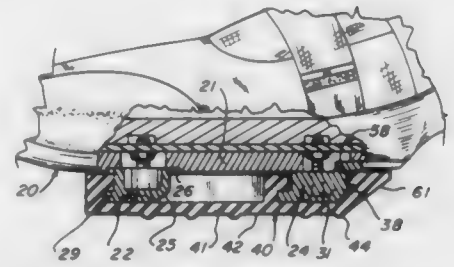
a steel toe box (**10**) having an inwardly turned relatively wide flange (**11**), said flange (**11**) having a larger width at two opposing respective end portions (**12**) and having a smaller width at a central portion (**14**) for increasing the tensile strength of said toe box (**10**), said flange (**11**) having a gradually thinner thickness from a junction portion to an edge thereof;

a polyethylene liner (**20**) having a shoulder for mounting and partial contiguous interface with said steel toe box (**10**);

a U-shaped pad (**30**) made of a hardened material having a size and shape substantially matching with a size and shape of said flange (**11**) of said steel toe box (**10**) for supporting said steel toe box (**10**); and,

a middle sole (**40**) having a front end that lies below a front end of said flange (**11**) and having a U-shaped cutout (**41**) for alignment with and retention of said U-shaped pad (**30**), said middle thickness sole (**40**) having a thickness that is greater than a thickness of said U-shaped pad (**30**).

5,007,185



CLEAT COVER FOR BUCYCLE SHOE

Margaret A. Lazarski, P.O. Box 6594, Denver, Colo. 80206

Filed Oct. 13, 1989, Ser. No. 421,448

Int. Cl.[5] A43B *5/00*

U.S. Cl. 36—135 **9 Claims**

1. A cleat cover for use on a bicycle shoe equipped with a pair of bicycle pedal engaging shoe cleats defining spaced apart longitudinally aligned front and rear cleats mounted on a sole plate of said bicycle shoe, each cleat having a body portion defining a forwardly extending lip overhanging the sole plate and the rear cleat further defining a rearwardly directed notch

adjacent the sole plate, said cleat cover comprising a removable elastomeric shallow cup shaped housing for surrounding and covering said front and rear cleats, means on said housing for releasably engaging the forwardly extending lip of each of said cleat and securing said housing to said cleats, and means on said housing for releasably engaging within the rearwardly directed notch of said rear cleat, said lip engaging means and notch engaging means releasably gripping and securing said cover in cleat enclosing relationship whereby said cleats are protected by said cover to adapt said bicycle shoe for temporary use as a walking shoe.

5,007,186

DEVICE FOR IMPROVING THE SEAL BETWEEN THE CUFF OF A SKI BOOT AND THE LEG

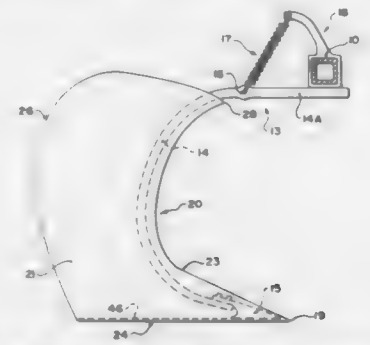
Horst Bischof, Graz, and Wolfgang Skerbinjek, Baernbach, both of Austria, assignors to Koflach Sport Gesellschaft mbH & Co. KG, Voecklabruck, Austria

Filed Dec. 2, 1988, Ser. No. 279,064
Claims priority, application Austria, Dec. 7, 1987, 3219/87
Int. Cl.[5] A43B *5/04, 11/00;* **A43C** *11/00*
U.S. Cl. 36—121 22 Claims

1. In a ski boot having at least one movable cuff part and an opposing inner liner, an improvement in the seal between the boot and a user's leg when the boot is closed around the user's leg, comprising the combination of:

band means for encircling one movable cuff part and the inner liner of the boot and for providing an adjustable closing seal between said movable cuff part, the inner liner and the leg; and

at least one coupling means mounted on the boot for releasably attaching said band means to the boot wherein said coupling means is optionally attached at said movable cuff part or at said inner liner at a point approximately on the longitudinal central axis of the boot on the external surface of said inner liner or at both said locations and wherein the coupling means mounted onto said movable cuff part is designed differently from the coupling means mounted on said inner liner so as to provide varying, selectable mounting positions of said band onto said coupling means.



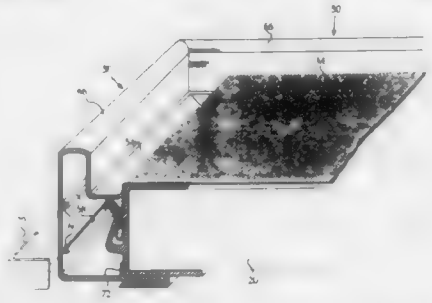
5,007,187

SNOW PLOW ARRANGEMENT FOR MOISTURE RETENTION IN A FIELD

Mervin R. J. Lloyd, Box 55, D'Arcy, Saskatchewan, Canada S0L 0N0

Filed Aug. 7, 1989, Ser. No. 390,236
Int. Cl.[5] E01H *4/00*
U.S. Cl. 37—220 11 Claims

1. Apparatus for improving moisture retention in the field comprising a frame, means for transporting the frame across the ground in a working direction, and a plurality of snow plow members each mounted on the frame and spaced in relation transverse to the working direction, each being shaped to form a furrow in snow on the ground and each being spaced and arranged such that the furrow formed by one is spaced from the furrow formed by the next, each of the snow plow members having a leading edge with a lowermost and forwardmost apex on a bottom end thereof and a pair of



diverging side surfaces extending from the leading edge to trailing edges thereof and wherein the distance between one snow plow member and the next snow plow member is greater than the width of each of the snow plow members across said trailing edges thereof, each of the diverging side surfaces having a lowermost leading edge lying in a substantially horizontal plane containing the apex, the leading edge being c-shaped so as to extend in a curved line rearwardly and upwardly from the apex to a rearmost point and from the rearmost point in a curved line forwardly and upwardly to an uppermost point forward of the rearmost point.

5,007,188

FRAMING SYSTEM AND COMPONENT PARTS THEREOF

Harold E. Feist, 374 Delaware Avenue, Toronto, Ontario, Canada M6H 2T8

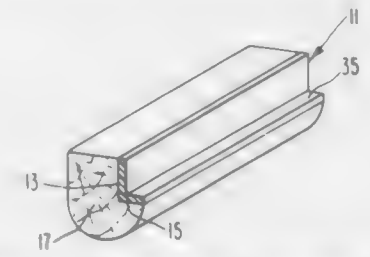
Filed Nov. 28, 1989, Ser. No. 442,271
Claims priority, application Canada, Jun. 19, 1989, 603198
Int. Cl.[5] A47G *1/06*
U.S. Cl. 40—152 16 Claims

13. A member for use in a framing system, said member having a generally rectangular C shaped cross section having a top wall, side wall and bottom wall, a jaw extending along said side wall defining therewith a pocket opening towards said top wall;

a lip extending along said bottom wall and defining therewith a slot opening towards said side wall, and

said pocket and said slot being substantially coextensive with said side wall and said bottom wall respectively.

5,007,189



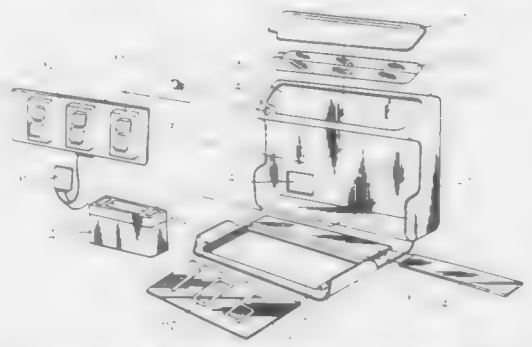
SEAL FOR ART DISPLAY FRAMES OF WOOD

Kendrick Buckwalter, 18 Chetwynd Rd., Paoli, Pa. 19301

Filed Mar. 17, 1988, Ser. No. 169,278
Int. Cl.[5] A47G *1/06*
U.S. Cl. 40—152 1 Claim

1. A wooden picture frame, having a rabbet configuration, as part thereof, which is sealed against the passage of liquids, gasses, vapors and tiny life forms emanating from said rabbet configuration comprising in combination: a wooden frame

including an inside wall section and a ledge section protruding therefrom whereby said inside wall section and said ledge section together substantially form the shape of the letter "L"; sealing means formed substantially in the shape of the letter "L", having a base section and an elongated section extending from said base section; said sealing means formed and disposed so that said base section is in abutment with said ledge section



and of substantially the same width and length of said ledge section and said sealing means further formed and disposed so that said elongated section is in abutment with said inside wall section and of substantially the same width and length of said inside wall section; said sealing means formed of material which is impervious to the passage of liquids, gases, vapors and tiny life forms.

5,007,190

SOLAR HOUSE-NUMBER INDICATING DEVICE

Chih-Yes Shyu, 4F, No. 144, Chu-Lin Road, Yung Ho, Taipei, Taiwan

Filed May 11, 1990, Ser. No. 522,101
Int. Cl.[5] G09F *13/04*
U.S. Cl. 40—564 1 Claim

1. A house-number indicating device comprising:

a house means provided with a front opening and an inner space defined by a pair of opposed, side wall, a rear wall, a flat bottom wall and a top wall, said top wall being formed with a top opening taking a major portion thereof and a bore locating in a corner, said rear wall being formed with at least a rear opening;

a door means attached to said housing means for closing said front opening of the housing means and being movable to open said opening;

a first and a second transparent means integrally formed in the door means;

rail means located on the inside surface of the door means disposed on opposite sides of the first transparent means;

a tunnel member located on the inside surface of the door means covering the second transparent means from inside of the door means and defining a passageway transverse to the rail means;

a first transparent plate marked with a series of desired numbers and releasably and slidably mounted on the rail means, said series of numbers facing the first transparent plate;

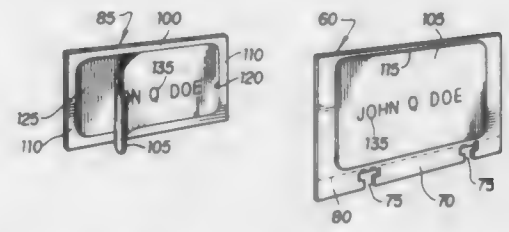
a second plate marked with a desired road name and releasably and slidably mounted in the tunnel member along the passageway defined thereby;

a solar battery characterized in converting solar energy into electric power and placed on the flat bottom in the inner space of the housing means;

a radiant solar energy collecting surface and a transparent layer for protecting the radiant solar energy collecting surface, which are corresponding in shape to the top opening, sequentially and fixedly fitted in the opening, said radiant solar energy collecting surface being connected to the solar battery;

a L.E.D. digital device having means for displaying digits which are selective to be corresponding to the series of numbers marked on the first transparent plate;

a control circuit means having a control circuit electrically connected to the L.E.D. digital device for number selection and ON-OFF controls and a series of switches for operating the number selection control and fitted in the opening of the rear wall of the housing means with the switches thereof exposing externally; and



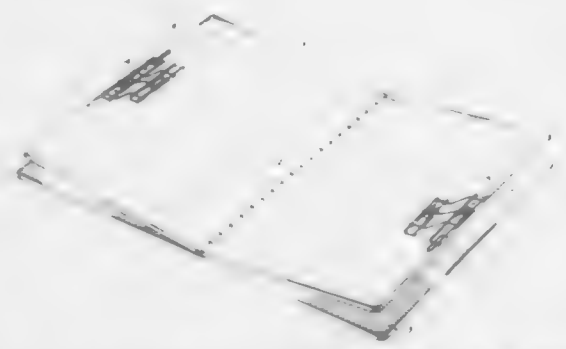
a sensor unit located in said bore characterized in self-adjusting its resistance compliant with the sunlight absorbed thereby for operating ON-OFF control of the control circuit of the control circuit means.

5,007,191

BUSINESS CARD AND CARD STOCK WITH LIFT-OUT PANEL AND BONDED EDGES

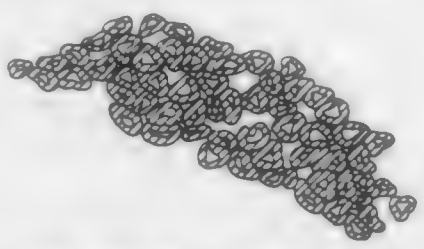
Gerald B. Klein, 13451 Stuart Ct., Broomfield, Colo. 80020

Continuation-in-part of Ser. No. 177,375, Apr. 4, 1988, Pat. No. 4,905,392. This application Nov. 7, 1988, Ser. No. 267,859
Int. Cl.[5] G09F *3/10*
U.S. Cl. 40—638 11 Claims



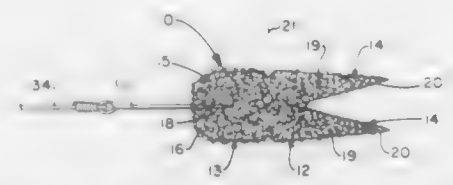
1. A business card, or the like, formed as a laminate including a face sheet adapted to carry information at its front side and having a contact adhesive at its back side, and a backing sheet secured to the face sheet by the contact adhesive, the improvement comprising:

(a) a score-cut means delineating and defining a lift-out panel in the face sheet and an edge margin strip between an edge of the panel and an edge of the business card; and



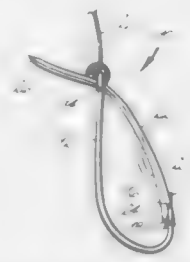
(b) a release means on the backing sheet engaging the lift-out panel of the face sheet to permit the lift-out panel to be separated from the edge margin strip at the score-cut means and lifted out and removed from the body of the card with the contact adhesive at the back side of the lift-out panel being intact while the edge margin strip of the face sheet and corresponding marginal portion of the backing sheet remain tightly and permanently bonded together by the contact adhesive, said release means extending a short distance beyond the score-cut means and a short distance into the marginal edge strip, whereby to insure a positive and easy separation of the lift-out panel and contact adhesive thereon from the backing sheet.

5,007,192
LAPBOARD
Nelson Hochberg, P.O. Box 192, Flagstaff, Ariz. 86002
Filed Oct. 19, 1988, Ser. No. 259,715
Int. Cl.[5] G09F *3/18*
U.S. Cl. 40—661 2 Claims



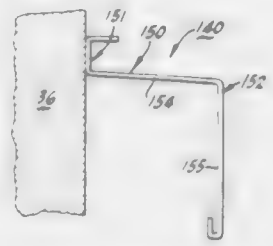
1 A navigation lapboard for holding aviation charts, flight logs, or the like, comprising in combination:
(a) a clear base sheet for supporting two or more charts or the like, and having first and second opposing edges,
(b) a hinged spring clip secured to said clear base sheet between the first and second opposing edges thereof, and
(c) first and second clear cover sheets for covering two or more charts or the like, each of said first and second clear cover sheets being attached to said hinged spring clip and generally overlying said clear base sheet;
whereby each of said first and second clear cover sheets can hinge out to permit a chart or the like to be inserted between each of said clear cover sheets and said clear base sheet

5,007,193
FISHING LURE WITH IMPROVED ELASTOMERIC SKIRT
George R. Goodley, Kinston, N.C.; Phillip R. Harman, Waynesboro, and Charles W. Prather, Charlottesville, both of Va., assignors to E. I. Du Pont de Nemours and Company, Wilmington, Del.
Filed Jan. 17, 1990, Ser. No. 466,553
Int. Cl.[5] A01K *85/00*
U.S. Cl. 43—42.28 11 Claims



6. An artificial fishing lure comprising a body having attached thereto a fish hook and a skirt of multiple flexible strands, each strand being formed from coalesced multiple filaments of synthetic elastomeric polymer, the polymer being a clear spandex polymer or a clear thermoplastic elastomer, the individual filaments of the strand being circular, non-circular or hollow in cross-section, the skirt comprising 10 to 300 strands, each strand being formed of 40 to 300 coalesced filaments and having a void fraction of at least 0.25 and a titer in the range of 940 to 13,000 dtex.

5,007,194
ARTIFICIAL FISHING LURES
Archibald S. Coody, Hemphill, Tex., assignor to Fred Arbogast Company, Inc., Akron, Ohio
Filed Jan. 26, 1990, Ser. No. 470,850
Int. Cl.[5] A01K *85/00*
U.S. Cl. 43—42.29 9 Claims



1 An artificial fishing lure for use in association with a fish hook having at least one point, said lure comprising:
a body having a forward head portion and a trailing portion, said body portion is natural sheepskin which presents at least one planar surface and which exhibits supple flexibility, at least when immersed in water;
a plurality of relatively long fibers which are the natural wool fibers presented from the planar surface of said sheepskin and extending outwardly from said head portion;
said head portion adapted to be penetrated by the point of a fish hook

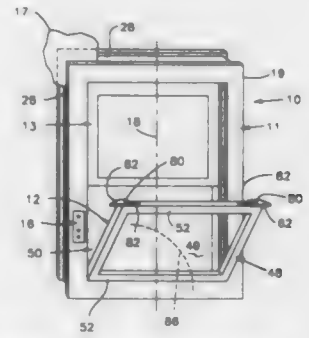
5,007,195
WEEDLESS FISHING HOOK AND LURE
James A. Patterson, 2074 20th St., Sarasota, Fla. 34236
Filed Apr. 3, 1990, Ser. No. 504,343
Int. Cl.[5] A01K *85/00*
U.S. Cl. 43—42.43 6 Claims

6 A weedless-type fish hook comprising
three fish hooks each having connected, coextending shanks each with a hooking end and a common eyelet end;
each said hooking end having a sharp distal tip and a barb spaced from said tip;
a length of very thin, flexible, pliable, pierceable entirely hollow tubing, one end of which is securely fitted over each said hooking end so as to conceal each said tip and each said barb within one said tubing, the other free end of each said tubing being slidably insertable through said eyelet end;
each said tip piercing through the corresponding said tubing and exposing each said tip for use when said tubing is manually flexed by hand between said tip and said eyelet end toward said shanks prior to use;
said tubing is internally lubricated.

5,007,196
INSECT GUARD SYSTEM AND METHOD OF USE
Anne L. Saunders, and John G. Fields, both of P.O. Box 979, Jamestown, Calif. 95327
Continuation-in-part of Ser. No. 367,848, Jun. 19, 1989, which is a continuation of Ser. No. 119,787, Nov. 12, 1987, Pat. No. 4,839,984. This application Feb. 8, 1990, Ser. No. 477,351
Int. Cl.[5] A01M *19/00, 1/22*
U.S. Cl. 43—112 6 Claims

1. A system for repelling crawling insects, comprising an elongated electrically insulating substrate comprising a flange section for mounting to a protected structure and an L-shaped shield section including a generally outwardly-extending base and a downwardly-extending leg spaced from the protected structure; a pair of elongated spaced-apart conductors mounted on the inside of the base and extending generally in the direction of the elongation; and power assembly means connected to said conductors for establishing a voltage differential providing a short circuit current of less than about 15 milliamps across said conductors, whereby crawling insects crossing the spaced conductors are subjected to electrical shock caused by bridging the voltage differential.

5,007,197
TERMITE CONTROL SYSTEM
Betty G. Barbett, P.O. Box 366, Barbers Point, Hi. 96862-0366
Filed Oct. 4, 1989, Ser. No. 417,066
Int. Cl.[5] A01M *1/24*
U.S. Cl. 43—124 11 Claims

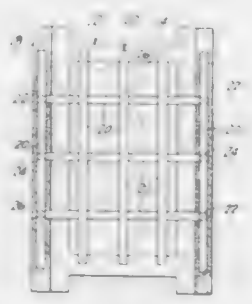


1. The method of termite treatment comprising determining proper spacing for drip tubing by a using a sample of the tubing on compacted soil in a slab area to determine rate of water movement into the soil, laying pressure-compensating drip tubing on top of the soil with openings in the tubing facing downward, and spacing lengths of the tubing at predetermined distances according to the rate of water movement determination, leaving first and second ends of the tubing exposed and extending outward from the slab area, covering the tubing with sand, covering the sand with a vapor barrier, covering the vapor barrier with gravel and pouring cement on top of the gravel and vapor barrier, thereby forming a slab, and releasing insecticide through the drip tubing into the soil beneath the slab.

5,007,198
PROCESS FOR THE ACCELERATED PRODUCTION OF TRIPLOID SEEDS FOR SEEDLESS WATERMELON CULTIVARS
Dennis J. Gray, Howey-in-the-Hills, and Gary W. Elmstrom, Leesburg, both of Fla., assignors to University of Florida, Gainesville, Fla.
Filed Jun. 8, 1988, Ser. No. 204,158
Int. Cl.[5] A01H *5/00, 4/00*; C12N *5/00*
U.S. Cl. 47—[illegible] 9 Claims

1. A process for producing triploid seed for seedless watermelons, said process comprising the following steps:
i. Producing and identifying a suitable tetraploid parental cultivar;
ii. Cloning the tetraploid parental cultivar using in vitro tissue culture techniques;
iii Transplanting and growing the new plants in a suitable soil medium;
iv. Planting the tetraploid plants in a field or greenhouse in a mixed stand with diploid plants; and
v Collecting the triploid seed from the fruit produced when the tetraploid plants are pollinated by the diploid plants.

5,007,199
ANTI-INTRUSION WINDOW
John E. Dunagan, Solon, and Stanley Bernath, Pepper Pike, both of Ohio, assignors to Larmco Security, Inc., Walton Hills, Ohio
Filed Feb. 15, 1990, Ser. No. 480,238
Int. Cl.[5] G08B *13/08*
U.S. Cl. 49—13 [illegible] Claims



1. An anti-intrusion window comprising:
a frame assembly adapted to be attached to a building structure;
a sash assembly supported by said frame assembly for movement with respect to said frame assembly along a path of travel;
a position indicator supported by one of said assemblies;
a sensor supported by the other of said assemblies so that said sensor and said position indicator move with respect to one another when said sash assembly is moved along said path of travel, said sensor effective to detect the presence of said position indicator near said sensor; and,
an alarm system for triggering an alarm in response to the momentary presence of said position indicator near said sensor;
said sash assembly comprising means for moving said sash assembly along a second path of travel between a position on said first path of travel and a cleaning position wherein opposite sides of said sash are accessible for cleaning from the same side of the window and said sensor and said position indicator are supported by said assemblies such that movement along said second path to said cleaning position maintains said position indicator and said sensor apart to prevent said momentary presence.

5,007,200

WINDOW SECURITY SYSTEM

Gustavo Londono, 9117 Tivoli Pl., Boca Raton, Fla. 33434

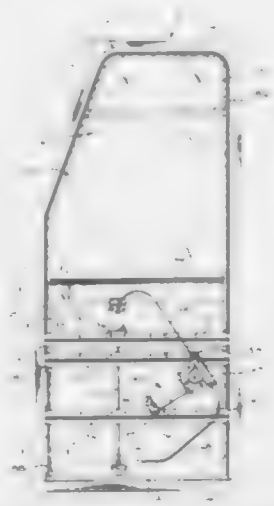
Filed Feb. 12, 1990, Ser. No. 478,518
Int. Cl.[5] E05B 65/10
U.S. Cl. 49—141 18 Claims

1 A releasable window security device for protecting against entrance to a building through a window, said security device comprising:

a security grill for positioning on the exterior of said building;

first and second pairs posts extending perpendicularly from said grill, said first pair of said posts being of sufficient length to extend to the interior of said building and including an opening at the distal end thereof;

at least four guide means mountable around said window for receiving said first and second pairs of posts, at least two of said guide means including spring means biased against said second pair of posts when said posts are received in said guide means; and



a pair of actuable latch means, each for being mounted in the interior of said building at a position to engage a different one of said openings for maintaining said device in a fixed position protecting said window and each being actuable to be disengaged from said openings simultaneously to permit the automatic release of said device from said window.

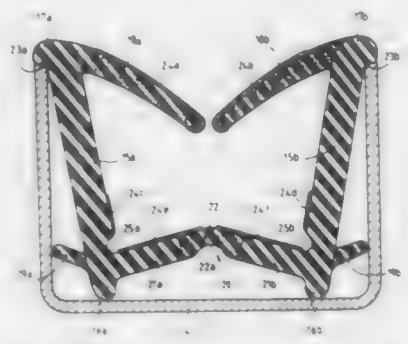
DOOR CONSTRUCTION

Terence P. D'Hoore, Mishawaka, Ind., and Mark L. Smith, Niles, Mich., assignors to Excel Industries, Inc., Elkhart, Ind.

Filed Apr. 4, 1990, Ser. No. 504,390
Int. Cl.[5] E05F 11/38
U.S. Cl. 49—348 6 Claims



1. In a door construction including a peripheral door frame defining opposite sides, cover panel secured to said door frame, said door frame including means for housing a reciprocative window, and means for shifting said window between up and down positions, the improvement wherein said door frame defines a groove running substantially the length of said frame, mounting braces, carrying side means for shifting, said mounting braces spanning said door frames, said mounting braces connected to said frame sides by fasteners extending through the mounting braces and seated in said groove, a channel oriented transverse with respect to said groove, an outer door panel seated in said channel.

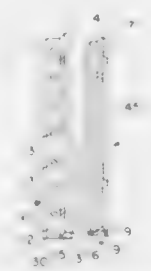
SEALING SLIDEWAY FOR A MOVING SHEET, AND IN PARTICULAR FOR A MOTOR VEHICLE WINDOW

Henri Guillon, Vaux-Sur-Seine, France, assignor to Hutchinson, Paris, France

Filed Feb. 24, 1989, Ser. No. 315,301
Claims priority, application France, Feb. 26, 1988, 88 02370
Int. Cl.[5] E06B 7/16; F16J 15/22
U.S. Cl. 49—441 11 Claims



1 A guiding slideway for a moving sheet, the slideway comprising two sealing lips connected to two side flanges which are interconnected by a traverse web, wherein said web comprises first and second webs connected to each other at a first end of each web and respectively connected to said side flanges at a second end of each web, said pair of webs forming at their junction an angle projecting towards said lips when the slideway is not locked into a run channel, and forming an angle projecting away from said lips when the slideway is locked into a run channel, wherein the sum of the lengths of said first and second webs is greater than the space allowed for the web within the run channel, whereby the slideway is locked within the run channel by a toggle action when inserted therein.

REPLACEABLE WEATHER SEAL

Matthew M. Katrynuik, 958 St. Matthews Avenue, Winnipeg, Manitoba, Canada R3G 0J6

Filed Mar. 15, 1990, Ser. No. 493,623
Int. Cl.[5] E06B 7/16
U.S. Cl. 49—493 7 Claims

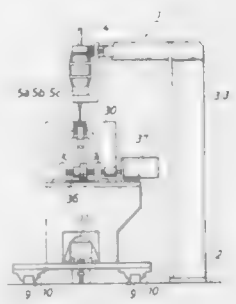
1 A replaceable weather seal suitable for attaching to a frame with screws, which is comprised of

(a) foam, which along its entire length has a first portion that is thicker than its second portion, a second portion that is substantially flat, and a third portion that extends vertically up from the second portion and then curves downwardly,

(b) an insert of approximately the same length as the foam, which insert is made of a non-deformable material, wherein a first portion and a third portion of the entire length of said insert is raised relative to its second portion, and its second portion is relatively flat;

(c) a cover that is made of a water and tear resistant material;

(d) wherein said insert is placed beneath the foam such that the first portion of the foam lies above the first portion of the insert, the second portion of the foam lies above the second portion of the insert and the vertically extending part of the third portion of the foam lies above the third portion of the insert, the cover is then sealingly attached around the foam and insert in such a manner that it closely conforms to the shape defined by the foam and insert, thereby forming a weather sealing member which is comprised of the covered foam and insert; and



(e) a carrier that is substantially flat along a first portion of its entire length and approximately "U"-shaped along a second portion of its entire length, wherein the approximately "U"-shaped portion is constructed so that its outside side portion defines an open slit along the entire length of the carrier into which the first and second portions of the weather sealing member holdingly fit and within which the weather sealing member is held when the replaceable weather seal is in use.

APPARATUS FOR SHAPING INGOTS INTO RIGHT CIRCULAR CYLINDRICAL FORM

Hiroyuki Ibe, and Takashi Mori, both of Fukui, Japan, assignors to Shin-Etsu Handotai Company Limited, Tokyo, Japan

Filed Sep. 14, 1989, Ser. No. 407,482
Claims priority, application Japan, Sep. 16, 1988, 63-230111; Nov. 10, 1988, 63-282558
Int. Cl.[5] B24B 49/00
U.S. Cl. 51—165.77 4 Claims

2. An apparatus for shaping monocrystal ingots of roughly circular cylindrical form into exact right circular cylindrical form comprising:

(i) an automatic center axis determining unit having

a support means for supporting the ingot,

a measure means for dimensionally measuring a plurality of cross sections taken normally to a roughly presupposed axis of the ingot,

a compute means for computing the location of a center of each of the cross sections based on the dimensional information of the cross sections obtained from said measure means and determining the optimum center axis based on the location of the thus obtained centers of the cross sections, and

a mark means for visibly marking the points at which the determined optimum center axis passes through the end faces of the ingot;

(ii) an automatic external cylindrical grinding unit;

(iii) an ingot setting unit having

a chuck means for chucking the marked ingot,

a monitor means for monitoring the points marked by the mark means,

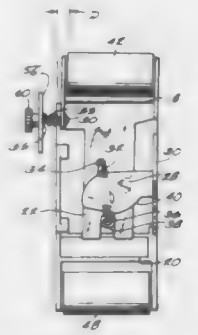
an align means for aligning the marked points of the ingot monitored by said monitor means with the spin center line of said external cylindrical grinding unit, and

a convey means for conveying the ingot into the grinding position of said external cylindrical grinding unit; and

(iv) an automatic diameter control unit having

a diameter measure means for measuring a local diameter of the ingot without coming in contact with the ingot and in a real-time manner;

an arithmetic process means for comparing the value of the measured diameter received from the diameter measure means with a predetermined reference value, and for generating a control signal in response to the result of the comparison; and



a grinder control means for controlling the grinder to determine its grinding depth in response to the control signal from the arithmetic process means.

TENSIONER RELEASE AND MECHANISM FOR BELT SANDERS

Joseph G. Farmerie, New Berlin, Wis., assignor to Milwaukee Electric Tool Corporation, Brookfield, Wis.

Filed Jun. 27, 1988, Ser. No. 211,866
Int. Cl.[5] B24B 23/06
U.S. Cl. 51—170 EB 6 Claims

1. A belt sander comprising,

a base,

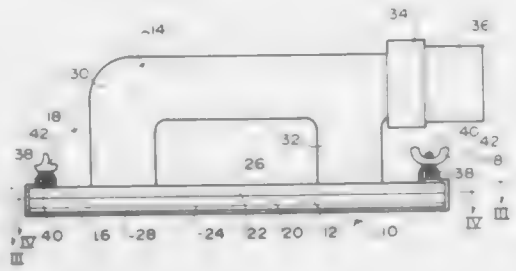
a rear roller mounted on said base,

a yoke mounted on said base for reciprocable motion,

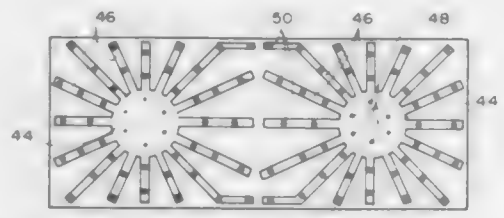
a front roller mounted on said yoke for movement farther from or closer to said rear roller to tension or relieve tension of a sanding belt mounted on the rollers,

cam means rotatably mounted on said base operatively engaging said yoke for moving said yoke from or towards said rear roller,

spring means connected to said yoke and said cam means and operative to bias said front roller against a sanding belt mounted on said rollers when said cam means is in its normal position, said cam means being out of contact with said yoke when said cam means is in its said normal position,



and means rendering the force of said spring means ineffective at some point in movement of said cam means from said normal position to a release position in which said front roller has moved closer to said rear roller to enable removal of said sanding belt.

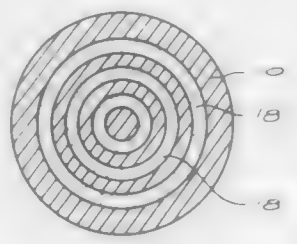


5,007,206

DUSTLESS DRYWALL SANDER

Patrick J. Paterson, Box 354, Ile Des Chene, Manitoba, Canada R0A 0T0

Filed Oct. 5, 1989, Ser. No. 417,455
Int. Cl.[5] B24B *23/00*
U.S. Cl. 51—170 R 15 Claims



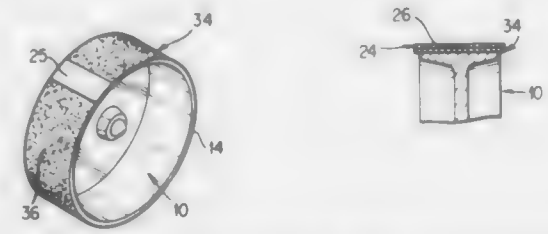
1. A sanding apparatus comprising:
a body with a flat front face and a rear face,
vacuum passage means in the body,
a plurality of spaced apart inlet openings through the front face of the body, communicating with the vacuum passage means;
at least one exhaust opening in the body, communicating with the vacuum passage means;
a handle secured to the body and having a vacuum duct therethrough, the vacuum duct communicating with the vacuum passage means through the exhaust opening;
a flexible sanding pad comprising a plurality of layers of an open mesh screen material, the pad being unattached to and removably overlying the front face of the body;
a porous abrasive mesh overlying the sanding pad; and
clamp means for clamping the abrasive mesh to the body whereby the sanding pad is held on the front face of the body by the abrasive mesh.

5,007,207

ABRASIVE PRODUCT

Cornelius Phaal, Glade Cottage, St Anne's Glade, Bagshot, Surrey, GU195EF, England

Filed Dec. 13, 1988, Ser. No. 283,620
Claims priority, application South Africa, Dec. 22, 1987, 87/9598
Int. Cl.[5] B23F *21/03*
U.S. Cl. 51—204 2 Claims



1 A tool insert comprising a disc-shaped abrasive compact having major flat surfaces on each of opposite sides thereof, at least a part of the periphery of one of the major flat surfaces providing a cutting edge for the insert, a cemented carbide support bonded to the other major flat surface, at least one curved recess located behind the cutting edge and extending into the cemented carbide support from the compact and carbide interface and containing abrasive compact material, said recess having the form of a spiral radiating out from the center of the abrasive compact.

5,007,208

ANCHOR FOR ROTARY SANDING DRUM

Theodore F. Garfield, Sunset La., Harrison, N.Y. 10528

Filed Jun. 22, 1989, Ser. No. 369,981
Int. Cl.[5] B24B *1/00, 7/19, 7/30*
U.S. Cl. 51—281 R 8 Claims

1. A method for preventing axial slippage, during utilization, of a closed loop sanding belt mounted on a rotating circular drum, comprised of a resilient material; said method comprising the steps of: (a) positioning an elongated strip of sandpaper on the outer surface of said drum, with sandpaper grit of said strip facing outwardly away from said drum; and (b) placing said closed loop sanding belt directly on said strip and in contact with the sandpaper grit thereof; and wherein the length of said strip is less than the outer circumference of said drum.

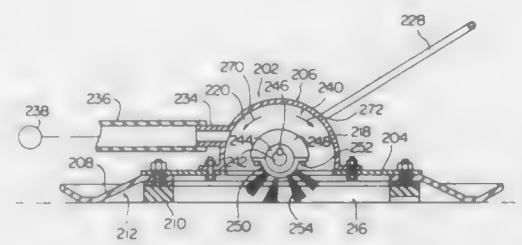
OPTICAL FIBER CONNECTOR POLISHING APPARATUS AND METHOD

Kazuharu Saito; Hiroyasu Matsukura; Hiroshi Komase; Haruhiro Tsuneda, all of Nagano; Junji Watanabe, Tokyo; Tadao Saito, Tokyo; Toshiroh Doy, Tokyo, and Kazuo Matsunaga, Tokyo, all of Japan, assignors to K.K. Sankyo Seiki Seisakusho, Nagano and Nippon T&T Corp., Tokyo, both of, Japan

Filed Jan. 13, 1989, Ser. No. 296,729
Claims priority, application Japan, Jun. 26, 1987, 62-159126; Jan. 14, 1988, 63-6483; Jan. 22, 1988, 63-12157
Int. Cl.[5] B24B *19/00*
U.S. Cl. 51—283 R 8 Claims

1. An optical fiber connector polishing apparatus comprising:
a chuck for supporting an optical fiber connector in such a manner that said optical fiber connector is rotatable in a clockwise/counterclockwise reciprocation mode;
a swing arm which holds said chuck to swing said chuck, in a horizontal plane, between a first fixed position and a second fixed position;
a reciprocating rotatable motor provided on said swing arm for rotating said chuck in said clockwise/counterclockwise reciprocation mode;
positioning means for positioning said swing arm selectively at said first or second fixed position on a swing locus thereof;
polishing means including a polishing element and rotation means for rotating said polishing element at high speed;
swinging means for swinging said swing arm in a horizontal plane in such a manner that the end of said optical fiber connector swings along a radial direction of the circular rotation of said polishing element and within a radial length thereof continuously while an end portion of said optical fiber connector is being polished with said polishing element; and
a reference member for positioning said end portion of said optical fiber connector at a reference position with respect to said chuck, such that said optical fiber connector will be polished to a predetermined length when a polishing operation is conducted with said polishing means,
said polishing element being arranged at said first fixed position and said reference member being arranged at said second fixed position of said swing arm, respectively

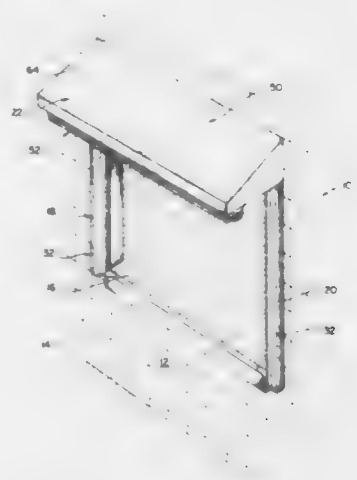


5,007,210

DEVICE CAPABLE OF SUCTION-ADHERING TO A WALL SURFACE AND MOVING THEREALONG

Fukeshi Urakami, 5-21-204 Konandai 4-chome, Konan-Ku, Yokohama, Japan

Division of Ser. No. 171,123, Mar. 21, 1988, Pat. No. 4,934,475.
This application Apr. 25, 1990, Ser. No. 514,148
Claims priority, application Japan, Apr. 4, 1987, 62-83431; Apr. 27, 1987, 62-103744; Jun. 1, 1987, 62-137887; Mar. 3, 1988, 63-48683
Int. Cl.[5] B24C *3/06;* B24B *23/00*
U.S. Cl. 51—429 6 Claims



1. A device for moving along a wall surface, said device comprising a main body and vibration generating means mounted on the main body, means for providing a holding force for holding the device against the wall surface, said vibration generating mean being adapted to impart a lifting force in a direction away from a wall surface to reduce the holding force, said vibration generating means also imparting a force in a predetermined direction along the wall surface to the main body by the vibration it generates, and consequently to move the main body in said predetermined direction along the wall surface, said vibration generating means including an eccentric weight means secured to a rotating shaft mounted rotatably on the main body of the device, said force in a direction away from the wall surface, and said force in the predetermined direction along the wall surface being imparted by the rotating of the eccentric weight means.

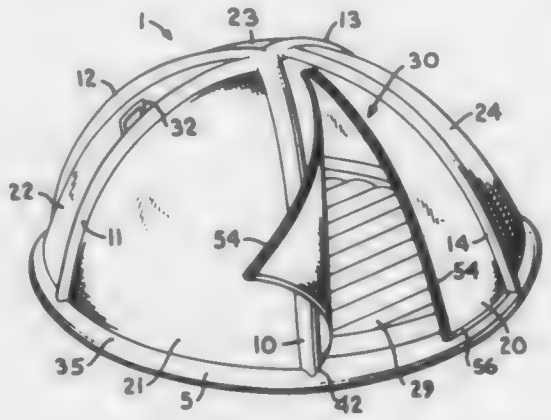
INFLATABLE DOCK SEAL

Wilfred P. Ouellet, Cranston, R.I., assignor to L.K. Goodwin Co., Inc., Providence, R.I.

Filed Mar. 16, 1990, Ser. No. 495,285
Int. Cl.[5] E04B *1/34*
U.S. Cl. 52—2.12 14 Claims

1. In an inflatable dock seal for a loading dock opening in a building wall, said opening having opposite side extremities and a top extremity extending between said side extremities, said dock seal including a pair of opposite side seal sections securable to said wall adjacent opposite side extremities of said opening, a top seal section securable to said wall adjacent the top extremity of said opening so that said top seal section extends between said side seal sections, each of said side seal sections and said top seal section including an inflatable portion which is inflatable to an expanded disposition and retractable to a collapsed disposition, means for inflating said inflatable portions to the expanded dispositions thereof and means for retracting said inflatable portions to the collapsed dispositions thereof upon deactuation of said inflating means, the improvement comprising said retracting means comprising substantially constant force resilient spring means for retracting at least a portion of said inflatable portions, said resilient spring means applying substantially constant, uniform retracting forces to said portion of said inflatable portions as said inflatable portions are moved between the collapsed and the expanded dispositions thereof.

5,007,212



INFLATABLE SHELTER

Monty Fritts, 1006 S. Elm, and Darren J. Myers, Rt. 4, Box 99, both of Ottawa, Kans. 66067

Filed Mar. 21, 1990, Ser. No. 496,870
Int. Cl.[5] E04H *15/00*
U.S. Cl. 52—2.18 2 Claims

1. A shelter comprising:
(a) a circular floor made from a flexible, water-resistant material and including a perimeter;
(b) an inflatable, annular, cross-sectionally tubular base frame with an inner edge, an outer edge, a base frame top and a base frame bottom, said base frame surrounding said floor and being fixedly attached at said base frame bottom to said floor perimeter;
(c) a plurality of inflatable, arcuate, cross-sectionally tubular support ribs each having a rib inner edge, a rib outer edge, opposite rib side edges, a rib lower end and a rib upper

end, each said rib at its lower end being attached to said base frame top and generally centered on said base frame;
(d) said ribs and said base frame comprising a flexible, air-impervious material;
(e) an apex;
(f) said ribs terminating at their upper ends at said apex;
(g) a wall comprising a plurality of flexible, water-resistant wall panels each having opposite side edges, a top and a lower edge, each said side panel being fixedly and integrally connected at its side edges to a respective adjacent pair of support ribs, each said side edge being substantially centered at its connection to a respective rib between said rib inner and outer edges, each said panel bottom edge being fixedly connected to base frame top and said connection therebetween being substantially centered between said base frame inner and outer edges, said wall panel tops being connected to said apex;
(h) a zippered door located in one of said wall covering panels between a respective pair of said support ribs, said apex and said base frame, said door comprising a first slit extending generally from said apex to said base frame and further comprising a horizontal slit extending along said base frame substantially between a respective pair of ribs;
(i) a pair of windows each located in a respective wall covering panel and including a pane of flexible, transparent material and a window frame connecting said window pane to said wall panel;
(j) a mattress including an inflatable annular, cross-sectionally tubular mattress frame with an inner edge, an outer edge, a top and a bottom, said mattress frame being positioned within and retained by said base frame with said mattress frame outer edge frictionally engaging said base frame inner edge and said mattress frame bottom resting on said floor, said mattress further including a plurality of elongated, juxtaposed, inflatable tubes with diameters approximately equal to a diameter of said mattress frame, said inflatable tubes extending across said mattress frame in substantially coplanar relationship with said mattress frame, each said tube including opposite ends fixedly connected to said mattress frame at said mattress frame inner edge, said elongated mattress tubes resting on said floor;
(k) said base frame including an air chamber;
(l) each said support rib having an air chamber;
(m) said mattress having a pneumatically discrete air chamber;
(n) said rib upper ends being fluidically interconnected at said apex and said ribs being fluidically interconnected with said base frame at their lower ends.

LOCK SYSTEM FOR PASSING OBJECTS FROM A RADIOACTIVELY CONTAMINATED CHAMBER INTO A CONTAINER

Burkart Schulte, Minden; Hakan Sterner, Hanover; Gerhard Wetzka, Veitshöchheim, and Norbert Hardt, Hanover, all of Fed. Rep. of Germany, assignors to Deutsche Gesellschaft für Wiederaufarbeitung von Kernbrennstoffen mbH, Hanover, Fed. Rep. of Germany

Filed Sep. 18, 1989, Ser. No. 408,545

Claims priority, application Fed. Rep. of Germany, Sep. 19, 1988, 3831775

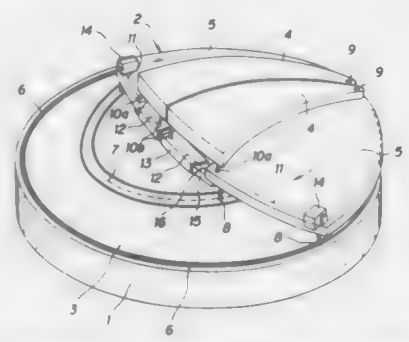
Int. Cl.[5] **E06B** *5/00*

U.S. Cl. 52—29 **6 Claims**

1. A lock system for passing objects from a contaminated first chamber through the lock system and into a container disposed in a contamination-free second chamber wherein the container can be docked at the lock system, the two chambers being separated by a partition wall, the lock system comprising:
opening means formed in said partition wall;
a disc defining a center point and being rotatably mounted in said opening means for rotation about an axis passing through said center point; and,
a plurality of lock openings formed in said disc and arranged therein along an imaginary circle concentric to said center point.

5,007,214

OPENABLE DOME-SHAPED ROOF STRUCTURE



Takashi Itami; Tadao Yuri, both of Tokyo, and Toru Aoyagi, Chofu, all of Japan, assignors to Ohbayashi Corporation, Osaka, Japan

Filed Apr. 5, 1990, Ser. No. 504,906

Claims priority, application Japan, Apr. 10, 1989, 1-88085; Apr. 28, 1989, 1-107757; Oct. 19, 1989, 1-270427; Nov. 9, 1989, 1-290096; Nov. 17, 1989, 1-297510

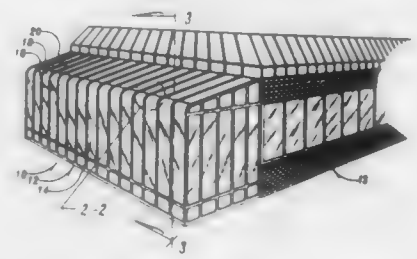
Int. Cl.[5] **E04B** *1/346*

U.S. Cl. 52—66 **10 Claims**

1. An openable dome-shaped roof structure comprising:
a peripheral side wall;
a first slide guide means provided upon said side wall along a circle;

a crescent-shaped fixed roof section having an arc-shaped outer periphery fixedly supported by said side wall and an arc-shaped inner periphery;
a second slide guide means provided upon said fixed roof section along a circular arc which is concentric with said circle;
a pair of slidable roof sections provided above the level of said fixed roof section and symmetrically arranged relative to a first diametral line of said circle, which line divides said slidable roof sections into equal two parts, said slidable roof sections meeting with each other at a first point where said diametral line intersects with said circle at the opposite side of said fixed roof section, each said slidable roof section being defined by an outer arc portion extending along said circle from said first point to a respective second point where said arc-shaped outer and inner peripheries of said fixed roof section meet with each other, an inner arc portion extending along said arc-shaped inner periphery of said fixed roof section from said second point to a third point where said second slide guide means terminates, and a substantially linear portion extending from said first point to said third point;
a third slide guide means provided upon each said slidable roof section along and near said inner arc portion thereof;
a pair of pivotable roof sections symmetrically arranged relative to said diametral line in such a manner that said pivotable roof sections close a space of a dome-shaped roof not covered by said fixed roof section and said slidable roof sections, each said pivotable roof section being provided above the level of a respective said slidable roof section and pivotably connected thereto at a position adjacent said first point;
means for pivotably moving said pivotable roof sections upon said slidable roof sections along said third slide guide means; and
means for slidably moving said slidable roof sections upon said fixed roof section along said first and second slide guide means.

5,007,215



SUNROOM

Mearl Minter, Oskaloosa, Iowa, assignor to Rolscreen Company, Pella, Iowa

Filed Apr. 24, 1989, Ser. No. 342,094

Int. Cl.[5] **E04B** *7/02;* **E04C** *3/18;* **E04D** *1/36*

U.S. Cl. 52—90 **19 Claims**

1. A sunroom comprising,
a frame support structure including a roof having support beams, said beams being elevated at one end and extending downwardly at the other end,
each of said beams having top and bottom sides and being constructed of wood and including a channel shaped top side extending longitudinally of said beam for receiving water, and
a pair of spaced apart metal reinforcement plates extending the substantial length and longitudinally of said beams in the bottom of said channel and fixedly secured to said beam whereby water received in said channel is adapted to run operatively over said plates to the other end of said beam.

5,007,216

VENTILATION BAFFLE AND INSULATION STOP

David H. Pearson, 1350-13 Ave. SE., Salmon Arm B.C., Canada V1E 2G7

Filed Jul. 18, 1989, Ser. No. 381,471

Int. Cl.[5] **E04B** *1/74;* **F24F** *7/00*

U.S. Cl. 52—94 **5 Claims**

1. A baffle for use in a house having an attic defined by:
(a) a vertical exterior wall having a horizontal top wall plate;
(b) parallel floor joists supported by said top wall plate; and
(c) spaced apart, inclined roof rafters securely connected to said top wall plate and said floor joists, said roof rafters having a roof covering fastened on their upper surface;
said attic having a vent around its outer periphery between said top wall plate and the underside of said roof covering enabling the flow of ventilating air between an exterior soffit and insulating material installed between said floor joists in the interior of said attic, wherein said baffle is installable between adjacent roof rafters to block the flow of ventilating air through said insulating material, said baffle having:
(d) a rectangular panel;
(e) a bottom flap hingedly connected to said rectangular panel along a first fold line and attachable to said wall plate;
(f) first and second side flaps hingedly connected along second and third fold lines on opposed sides of said rectangular panel, said side flaps being attachable to the inner face of said roof rafters; and
(g) a top flap hingedly connected along a fourth fold line to said rectangular panel and provided at either end thereof with a hingedly connected flap adapted to be secured to said inner face of said roof rafters;
wherein said first and second side flaps are provided with a plurality of printed lines perpendicular to said second and third fold lines and dividing said flaps into first and second sections of variable relative lengths, the length of said second section being chosen according to the distance between said wall plate and said underside of said roof, and scored lines provided on said second section parallel to said second and third fold lines for selectively varying the width of said second section and thereby adjust the width of said rectangular panel to different rafter spacings.

5,007,217

MULTIPLE PANE SEALED GLAZING UNIT

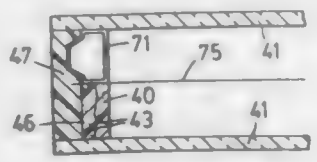
Michael Glover, and Gerhard Reichert, both of Ottawa, Canada, assignors to Lauren Manufacturing Company, New Philadelphia, Ohio

Continuation of Ser. No. 117,094, Nov. 5, 1987, abandoned, which is a continuation-in-part of Ser. No. 909,947, Sep. 22, 1986, abandoned. This application Apr. 10, 1989, Ser. No. 338,054

Claims priority, application Canada, Sep. 21, 1987, 547355

The portion of the term of this patent subsequent to May 23, 2006, has been disclaimed.

Int. Cl.[5] **E06B** *7/12;* **E04C** *2/54*



U.S. Cl. 52—172 **7 Claims**

1. A multiple plane insulating sealed glazing unit comprising two or more glazing sheets, said sheets being maintained in an

essentially parallel and spaced apart relationship to each other by a peripheral resilient spacing and sealing assembly, defining an insulating airspace between said sheets, which spacing and sealing assembly comprises an inner spacer strip sandwiched between said sheets, and located inwardly of the glazing edges, thereby creating an outwardly facing perimeter channel therebetween;

said inner spacer strip being composed of a moisture permeable flexible or semi-rigid silicone foam material preformed to have, when in the uncompressed condition, two opposite sides spaced so as to provide the desired spacing of said glazing sheets and containing desiccant material, said spacer strip having a preapplied ultra-violet resistant pressure sensitive adhesive on said opposite sides thereof and which abut said sheets, said adhesive having high tack and non-outgassing properties and said spacer strip having an inwardly directed face which is resistant to ultra-violet radiation, and having physical properties which permit said spacer strip to be coiled for storage, and

said spacing and sealing assembly further comprising an outer sealant filling said outer perimeter channel.

MASONRY BLOCK WALL SYSTEM AND METHOD

Fred G. Bengtson, Tempe, and Donald V. LoPiccolo, Phoenix, both of Ariz., assignors to Superlite Builders Supply, Inc., Phoenix, Ariz.

Continuation of Ser. No. 599,526, Apr. 12, 1984, abandoned. This application Oct. 14, 1986, Ser. No. 918,465

Int. Cl.[5] E04B *1/06;* **E06B** *1/04*

U.S. Cl. 52—204 **2 Claims**

1. A wall structure comprising

(a) a concrete footer having an anchoring means therein;

(b) a plurality of post-tensioning rods connected to said anchoring means and extending vertically from said footer;

(c) a plurality of stacked masonry building blocks arranged in courses with mortar therebetween and having voids therein;

(d) a plate positioned on the top course of said blocks;

(e) said rods extending through said voids in non-contacting relationship to said blocks, grouting or other masonry products and through said plate;

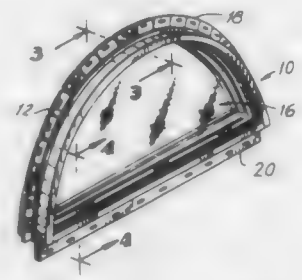
(f) tensioning means mounted on said plate and secured to said post-tensioning rods for maintaining a predetermined tension in said rods;

(g) said masonry building blocks each having opposing parallel faces interconnected by a single web member;

(h) means defining thermal insulation material in said voids to increase the thermal resistance of said wall structure to provide a wall structure having an R value greater than 10; and

(i) a steel lintel member extending over an opening provided in said wall structure, said lintel including a plurality of vertically extending rods connected thereto, each of said rods extending through voids in said blocks positioned above said lintel.

5,007,219



ROUND TOP WINDOW

Bertram Sayer, Princeton, N.J., assignor to 501 Thermal Profiles, Inc., Keasbey, N.J.

Filed Feb. 11, 1988, Ser. No. 154,896

Int. Cl.[5] E06B *1/26*

U.S. Cl. 52—204 **18 Claims**

1. A round top window frame comprising

a first individually formed flexible elongated member having a first end and a second end, with said first elongated member having a curved configuration,

a second individually formed elongated member having a first end and a second end, with said second elongated member shorter than said first elongated member,

first attachment means for attaching said first end of said first elongated member and said first end of said second elongated member,

second attachment means for attaching said second end of said first elongated member to said second end of said second elongated member,

a first stop member,

first stop member attachment means for attaching said first stop member and said first elongated member,

a second stop member, and

second stop member attachment means for attaching said second stop member and said second elongated member, with said first and second elongated members forming a frame.

5,007,220

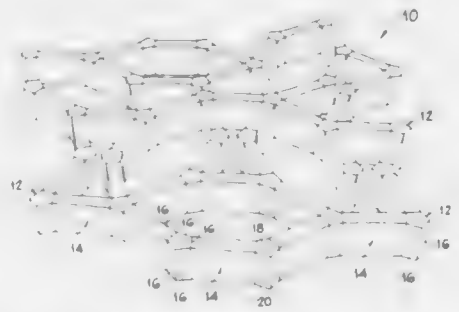
NON-PERIODIC AND PERIODIC LAYERED SPACE FRAMES HAVING PRISMATIC NODES

Haresh Lalvani, 92 Horatio St., #3M, New York, N.Y. 10014

Continuation of Ser. No. 36,395, Apr. 9, 1987, abandoned. This application Dec. 2, 1988, Ser. No. 282,991

Int. Cl.[5] E04H *12/00*

U.S. Cl. 52—311 **22 Claims**



1. A space frame, the combination comprising:

a plurality of prismatic nodes arranged in a first spaced, non-periodic, planar array, each of said prismatic nodes having a substantially continuous outer surface comprising a top surface and a bottom surface, each being identical regular polygons with p-sides, and p-side surfaces having opposite edges,

each of said side surfaces being coupled to said top and bottom surfaces, and each opposite edge of each of said side surfaces being coupled to a respective opposite edge of an adjoining side surface;

a plurality of struts of substantially equal length located in the same plane as said planar array of prismatic nodes, each of said struts having opposite ends; and

means, coupled to each of said struts and each of said prismatic nodes, for coupling the opposite ends of each strut to two adjacent prismatic nodes to form at least one set of identical polygonal areas bounded by said struts and nodes, thereby forming a continuous space frame having a pattern defined by said polygonal areas that does not repeat and does not have translational symmetry,

wherein the angle between any given pair of struts connected to the same prismatic node is determined by the angle between the respective p-side surfaces to which the struts are coupled, and

wherein p is selected from the group consisting of the odd numbers greater than three and the even numbers greater than six.

SNAP-IN GLAZING POCKET FILLER

Thomas E. Matthews, Lilburn, and Charles P. Touton, Roswell, both of Ga., assignors to Kawneer Company, Inc., Norcross, Ga.

Filed Feb. 23, 1990, Ser. No. 484,171

Int. Cl.[5] E04C *3/00;* **E04D** *1/36*

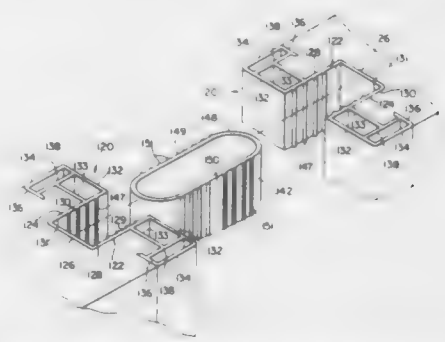
U.S. Cl. 52—464 **11 Claims**

1. A snap-in glazing pocket filler for use with a structural frame member having walls defining a glazing pocket, comprising:

an elongated metal plate having a rear face and having a width sufficient to cover said glazing pocket, said elongated plate having a pair of flanges projecting rearwardly from said rear face thereof; and

a pair of plastic retaining legs having corresponding snap-on sockets formed thereon for engaging said rearwardly projecting flanges on said rear face of said elongated plate to fasten said plastic retaining legs to said plate, said retaining legs extending rearwardly and outwardly of said plate to engage said walls defining said glazing pocket.

5,007,222



FOAMED BUILDING PANEL INCLUDING AN INTERNALLY MOUNTED STUD

Harry W. Raymond, 203 Richey St., P.O. Box 395, Lock Haven, Pa. 17745

Continuation-in-part of Ser. No. 273,760, Nov. 14, 1988, Pat. No. 4,862,660, which is a continuation of Ser. No. 72,718, Jul. 13, 1987, abandoned. This application Jun. 23, 1989, Ser. No. 370,988

Int. Cl.[5] E04B *1/76, 2/00;* **E04C** *2/34, 2/26*

U.S. Cl. 35—586 **12 Claims**

1. A structural column assembly for use as a structural support element to join two modular wall units together end-to-end, each of said wall units having an exterior surface and an interior surface, said column assembly comprising:

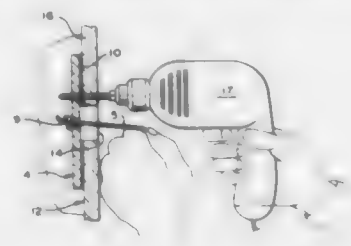
first and second end columns, each of said end columns having a pair of opposed planar side walls having a distal end and a proximal end and a planar end wall joining said proximal ends of each of said pairs of side walls into a generally U-shaped member, each of said pairs of side walls being arranged to be generally parallel with the exterior and interior surfaces of said wall units, each of said planar side walls having an inside face and an outside face, each of said outside faces having a primary leg extending outwardly from said distal end, said primary leg defining an elongated planar wall generally perpendicular to said outside face and having a termination at a predetermined transverse distance from said outside face, a planar outside vertical strip positioned at said termination of said primary leg generally parallel to said outside face along the full length of said end column and having a free end, said planar strip terminating along said free end in an inwardly directed finger, and a planar inside vertical strip positioned generally parallel and spaced from said planar outside vertical strip joining said primary leg to said finger, said end columns defining an interior space when said planar walls defined by said primary legs are placed into intimate contact with each other; and

insert means for insertion into said interior space for securing said end columns to each other.

5,007,223

BLIND ANCHORING OF WALL FIXTURES

Andrew P. Holland, 4100 Rosemary St., Chevy Chase, Md. 20815



Filed Feb. 20, 1990, Ser. No. [illegible]1,323

Int. Cl.[5] E04B *1/00*

U.S. Cl. 52—741 **8 Claims**

1. A method of blind anchoring for mounting a screw-securable fixture on a dry wall panel having an inaccessible inner surface, comprising marking on the panel in a selected location positions of any screw holes in a base flange of said fixture, cutting an opening through said panel inside said hole markings, inserting through said opening a longitudinally elongated stiff machinable plate member trailing a strong flexible string extending substantially centrally through and beyond a back of said member and having on a trailing side thereof a self-sticking adhesive coating, manipulating said plate member through

said opening into position to back said hole markings, pulling said plate member by said string to adhere the adhesive coating to said inner surface of said panel, and, while holding said plate

member in position by said adhesive and pull on said string, drilling holes in situ in said plate member through said panel in said marked positions for anchoring said fixture on said panel by screw means secured to said plate member

TOOL AND METHOD FOR INSTALLING ROOF GUTTERS ON BUILDINGS

Carl L. Segneri, 16054 University Ave., South Holland, Ill. 60473

Filed Apr. 26, 1990, Ser. No. 514,749
Int. Cl.[5] B25C *1/02*
U.S. Cl. 52—741 13 Claims

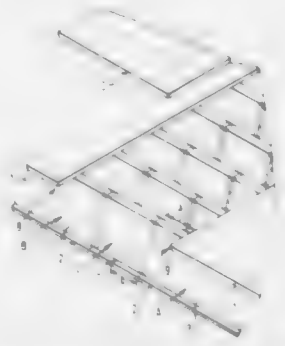
1. A gutter installation hand tool which comprises:

(a) means for temporarily positioning a gutter that is to be installed on a residence or other building in the desired place against the wall of the building by (i) providing support for the bottom wall of the gutter, and (ii) preventing the gutter from moving away from the building wall, all without any attachment of the gutter or the positioning means to the building;

(b) a piston positioned to contact, at its forward end, the head of a nail to drive the nail through at least one of the rear wall of the gutter and the rear portion of the associated hanger, and then into the building wall, when the piston is struck with a hammer on its other end; and

(c) means for holding and guiding (i) a nail to secure the gutter to the building, and (ii) said nail-driving piston while the piston is in contact with the head of the nail,

said tool being configured to be held in one of the user's hands to maintain said temporary positioning of the gutter,



whereby the gutter may be temporarily maintained in place against the building wall by the tool held in one of the user's hands, and then at least partially secured to the building when the user strikes the free end of the nail-driving piston with a hammer held in the user's other hand to drive a nail positioned in the holding and guiding means through the rear wall of the gutter and/or the rear portion of the associated hanger, and then into the building wall.

CONSTRUCTION OF LARGE SANDWICH STRUCTURES

James A. Teasdale, Newcastle upon Tyne, England, assignor to British Shipbuilders, England

PCT No. PCT/GB86/00579, § 371 Date Jul. 21, 1987, § 102(e) Date Jul. 21, 1987, PCT Pub. No. WO87/02086, PCT Pub. Date Apr. 9, 1987
PCT Filed Sep. 29, 1986, Ser. No. 64,255
Claims priority, application United Kingdom, Sep. 27, 1985, 8523933
Int. Cl.[5] E04C *2/32*
U.S. Cl. 52—[illegible] 4 Claims

1. A composite structure having a metal panel comprising first and second parallel plates having opposing faces, a corrugated metal stiffener sandwiched between said plates and having a plurality of parallel corrugations defining peaks and troughs, each corrugation having an end, said first and second plates being secured to the peaks and troughs, respectively, of said stiffener by weld lines extending along the peaks and troughs, said panel being assembled to a like panel with the corrugations of both panels aligned end-to-end, with straight edges of said first plates opposing one another, and with straight edges of said second plates opposing one another, wherein said straight edge of each first plate extends parallel to and forwardly of a plane containing the ends of the corrugations of the respective panel, and said straight edge of each second plate extends parallel to and rearwardly of said plane, and (a) a butt weld joins said first plate edges (b) a corrugated insert piece is joined at each of said opposing faces by butt welds to the ends of the corrugations on the respective panels and (c) a plate insert is butt-welded at parallel edges thereof to said straight edges of said second plates.

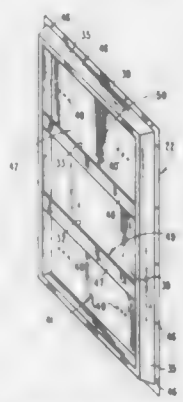
INSULATED REFRIGERATOR DOOR CONSTRUCTION

Thomas E. Nelson, Anchorage, Ky., assignor to Soltech, Inc., Shelbyville, Ky.



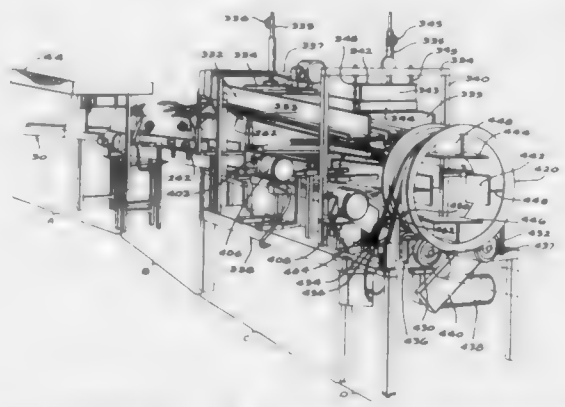
Filed May 1, 1989, Ser. No. 345,967
Int. Cl.[5] E04B *1/78*; E04C *2/34*
U.S. Cl. 52—809 4 Claims

1. An insulated refrigerator door which is designed and arranged to enable the natural flow of air from the lower interior of the refrigerator up through the door insulation and back to the upper interior of the refrigerator, said insulated refrigerator door comprising:

an outer door panel;

an inner door panel defining therein a plurality of vent holes positioned in a series across the lower portion of said panel and a plurality of vent holes positioned in a series across the upper portion of said panel; and

an insulation panel disposed and filling the cavity between said inner and outer door panels and including a flexible permeable layer positioned adjacent to the interior surfaces of said inner and outer door panels, insulation material being disposed between said inner and outer panels and within said flexible permeable layer, said vent holes being designed and arranged for flow communication with said insulation material by way of said flexible permeable layer, wherein said insulation panel is arranged with a plurality of pouches constructed from material



comprising said flexible permeable layer, each pouch being filled with insulation and separated from each other by a seam.

5,007,227

APPARTAUS AND METHOD FOR PACKAGING CITRUS FRUIT

Stanley McClusky, and Jerry L. Hayd, both of Bakersfield, Calif., assignors to McClusky Machinery Sales & Service, Edison, Calif.

Division of Ser. No. 260,437, Oct. 20, 1988, Pat. No. 4,907,396. This application Jan. 12, 1990, Ser. No. 465,999
Int. Cl.[5] B65B *61/00*
U.S. Cl. 53—243 8 Claims

1. In combination with an apparatus for packaging citrus fruit in a box the combination of:

a rotatable drum having means for receiving a box;

said box receiving means including side plates and top and bottom plates defining a box opening;

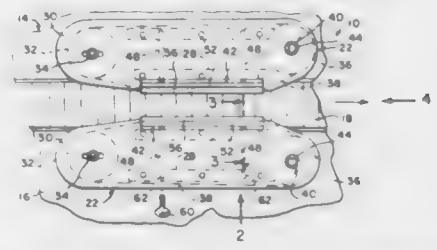
the longitudinal dimension of said plates being less than the axial dimension of said rotatable drum;

means for rotating said drum through 180° including a set of wheels engaged with said drum;

and means for causing said drum to pause in its rotation while a box inverted through 180° by said drum is pushed from said drum by a succeeding box.

5,007,228

ADJUSTABLE BOTTLE GRIPPER BELT



Kenneth Herzog, 135 Industrial Blvd., Riverhead, N.Y. 11[illegible]1

Filed Nov. 8, 1989, Ser. No. 433,115
Int. Cl.[5] B65[illegible] *7/28*; B67B *3/20*
U.S. Cl. 53—282 3 Claims

1. Apparatus for gripping a container when being capped in a container filling and capping machine of the type having a table top with a conveyor for allowing the container to travel therealong and a capping mechanism disposed above the conveyor, said apparatus comprising at least two adjustable container gripper belt assemblies oppositely mounted on the table top adjacent the conveyor so that said assemblies can be adjusted to grip containers of various sizes that travel on the conveyor and prevent rotation of the container when a cap is rotatably mounted onto a threaded bottle neck of the container by the capping mechanism, wherein each of said adjustable container gripper belt assemblies includes:

(a) a pair of horizontally spaced apart stationary bars mounted above the table top in parallel relationship to the conveyor;

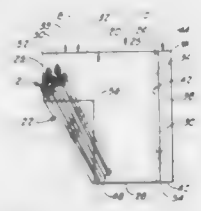
(b) a pair of elongated plates mounted on the bars in a sandwiched relationship above and below said bars;

(c) an idler pulley being adjustable and rotatably mounted between said plates at one side thereof;

(d) a drive pulley rotatably positioned between said plates at the other side thereof;

(e) a continuous flexible gripper belt extending about said idler pulley and said drive pulley;

(f) means for rotatably driving said drive pulley so that said gripper belt will move at same speed as the conveyor;



(g) means mounted on each said bar below the container top for horizontally adjusting said belt of each said assembly to individually engage with containers of varying size and shape.

5,007,229

METHOD OF WRAPPING UTILIZING A SELF ADHERING WRAPPING MATERIAL

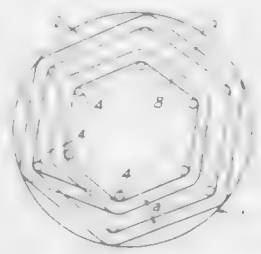
Donald E. Weder, Highland; William F. Straeter, Breese; Joseph G. Straeter, Highland, all of Ill.; Franklin J. Craig, Valley Park, Mo.; Wilma M. Donnelly, Hi[illegible]hland, Ill., and Jack W. Redditt, Nashville, Tenn., assignors to Highland Supply Corporation, Highland, Ill.

Filed Jun. 20, 1989, Ser. No. 368,597
Continuation-in-part of Ser. No. 249,761, Sep. 26, 1988, which is a continuation-in-part of Ser. No. 219,083, Jul. 13, 1988, Pat. No. 4,897,031, which is a continuation of Ser. No. 613,080, May 22, 1984, abandoned, which is a continuation-in-part of Ser. No. 235,541, Aug. 11, 1988, Pat. No. 4,835,834, which is a continuation of Ser. No. 876,405, Jun. 20, 1986
Int. Cl.[5] B65[illegible] *11/56*, *11/48*
U.S. Cl. 53—3[illegible] 56 Claims

1. A method of wrapping at least a portion of an item, comprising:

providing a wrapping material comprising a sheet of material sufficiently sized to wrap at least a portion of the item, wherein the sheet of material comprises an upper surface and a lower surface; and a cling material [illegible]ured to a portion of the sheet material, wherein the cling material is capable of connecting to the sheet of material and itself

upon contacting engagement and wherein the sheet of material with the cling material connected thereto is wrappable about the item whereby portions of the cling material contactingly engage and connect to portions of the wrapping material for generally securing the sheet of material wrapped about at least a portion of the item; and



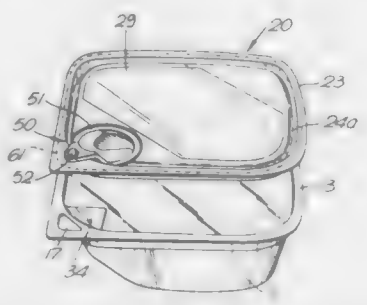
wrapping the item by disposing the sheet of material about the item so that portions of the cling material contactingly engage and connect to portions of the wrapping material for generally securing the sheet of material about at least a portion of the item.

5,007,230

SAFE PACKAGING FOR DETONATING CORD

Didier Gaston, Kourou, Guyana, assignor to Schlumberger Technology Corporation, Houston, Tex.

Filed Feb. 6, 1990, Ser. No. 475,664
Claims priority, application France, Feb. 8, 1989, 89 01617
Int. Cl.[5] B65B *63/04*
U.S. Cl. 53—397 **2 Claims**



1. A method of packaging a detonating cord comprising explosive material contained in a sheath, said method comprising the step of winding the detonating cord on a support in such a manner that every portion of the detonating cord in the winding , is spaced apart from the nearest portions which are substantially parallel thereto by a distance (a) lying in a range between the distance below which detonation is transmissible from one portion to the nearest portion, and the distance beyond which said containing sheath is no longer destroyed by the detonation of a nearest portion.

5,007,231

CONTAINER

Ole Ingemann, Ryslinge, Denmark, assignor to PLM AB, Malmo, Sweden

Division of Ser. No. 46,048, Apr. 16, 1987, Pat. No. 4,795,055.
This application Dec. 23, 1988, Ser. No. 289,385
Claims priority, application Sweden, Aug. 18, 1986, 8503830
Int. Cl.[5] B65B *7/28, 61/18*
U.S. Cl. 53—412 **10 Claims**

1. A method for sealing an open top of a container having a closed bottom and containing goods to be sealed against the ambient atmosphere, said method comprising

attaching a first lid to the open top of the container by a peelable connection so that the lid seals the contents in the container,

attaching a second lid to the container by a permanent sealed connection in a region outside the first lid to form a closed, sealed space between the lids, and

forming the second lid with a weakened portion surrounding said peelable connection between said first lid and the open top of the container to enable separation of said second lid at said weakened portion and provide access to said first lid to enable its removal to gain access to the contents in the container.

5,007,232

APPARATUS AND METHOD OF USE OF STERILIZING CONTAINERS USING HYDROGEN PEROXIDE VAPOR

Vance L. Caudill, Columbus, Ohio, assignor to Abbott Laboratories, Abbott Park, Ill.

Filed Nov. [illegible], 1989, Ser. No. 439,130
Int. Cl.[5] B65B *55/06, 55/10, 31/02*
U.S. Cl. 53—426 **14 Claims**

1. Apparatus for aseptically filling a container, said apparatus comprising:

a housing,

a source of liquid hydrogen peroxide,

means for providing a flow of heated gas,

means for causing said hydrogen peroxide to mix with said heated gas, the mixing thereby vaporizing said hydrogen peroxide,

means inside said housing for dispensing the vaporized hydrogen peroxide, said means for dispensing said vaporized hydrogen peroxide including means for dispensing said vaporized hydrogen peroxide into said container,

fill tube means extending into said housing for dispensing product into said container,

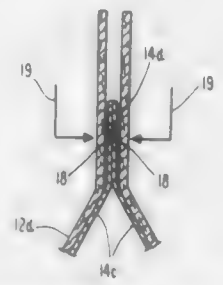
means within said housing for sealing said container, and

means providing for the passage of said container between the interior and the exterior of said housing.

5,007,233

MULTIWALL BAG AND METHOD OF PACKAGING UTILIZING MULTIWALL BAGS

Ajit K. Bose, Lawrenceville, N.J., assignor to Union Camp Corporation, Wayne, N.J.



Filed Aug. 31, 1989, Ser. No. 401,336
Int. Cl.[5] B65B *7/06*
U.S. Cl. 53—449 **10 Claims**

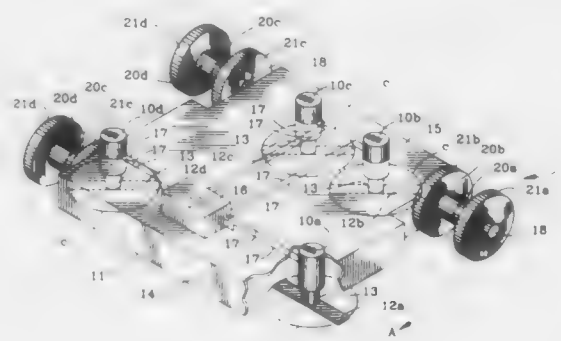
1. A method of packaging bulk material in a multiwall bag which includes a ply of uncoated paper which provides an inner surface, comprising the steps of:

providing a thermoplastic bag, said thermoplastic bag having a top inner surface;

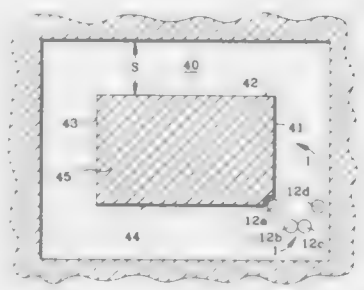
inserting said thermoplastic bag within the multiwall bag, wherein an outer surface of said thermoplastic bag substantially contiguously contacts the inner surface of said ply of uncoated paper;

substantially filling said thermoplastic bag with the bulk material;

ultrasonically sealing the top inner surface of said thermoplastic bag filled with the bulk material through the walls of the multiwall bag and forming a seal between said multiwall bag and said thermoplastic bag that is weaker than the seal of the inner surfaces of said thermoplastic bag; and



closing said multiwall bag.



5,007,234

AUTOMATIC SELF-GUIDING LAWN MOWER AND MOWING METHOD

Darlene M. Shurman, 609 16th St., NW.; Gerald L. Shurman, 1221 Cleveland Ave., NW., and Louis W. Shurman, 316 15th St., NW., all of, Canton, Ohio 44703

Continuation-in-part of Ser. No. 441,628, Nov. 27, 1989, abandoned. This application Aug. 15, 1990, Ser. No. 568,221
Int. Cl.[5] A01D *34/78, 69/02*
U.S. Cl. 56—10.2 **16 Claims**

13. A method of mowing a lawn with an automatic self-guiding lawn mower having at least first and second motor means for driving operatively connected blade means and wheel means, respectively, for cutting the lawn and moving the mower, including the steps of:

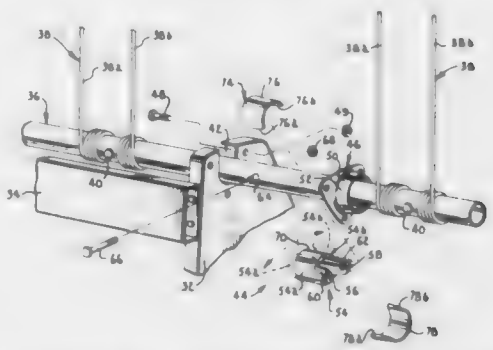
(a) manually cutting a border around the lawn;

(b) positioning the mower adjacent to a peripheral edge of an uncut area of the lawn;

(c) actuating the first motor means for driving the operatively connected blade means;

(d) actuating the second motor means for driving the operatively connected wheel means to move the mower in a curved path into the uncut area of the lawn;

(e) sensing a predetermined change in the operation of the first motor means when the attached blade means moves to a certain position in an uncut area of the lawn; and



(f) causing a certain change in the second motor means upon detection of the predetermined change in the first motor means when the mower means reaches said certain position in the uncut area so that the mower moves in a generally straight line along the peripheral edge of the uncut area of the lawn.

5,007,235

TINE TUBE BEARING ASSEMBLY FOR A HARVESTING REEL

Dwight E. Nickel, Newton; Michael L. O'Halloran, Hesston, and Cecil L. Case, Newton, all of Kans., assignors to Hay & Forage Industries, Hesston, Kans.

Filed Jun. 7, 1990, Ser. No. 534,833
Int. Cl.[5] A01D *57/03*
U.S. Cl. 56—12.4 **17 Claims**

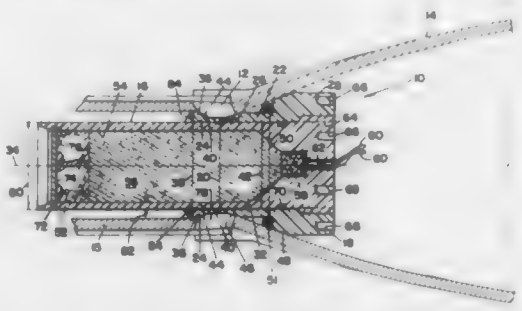
1. In a harvester reel having a plurality of circumferentially spaced tine bars which are oscillated about their longitudinal axes within openings in carrier arms for the bars during operative rotation of the reel, thereby changing the angle of presentation of crop-engaging tines on the bars as the bars describe a circular path of travel during rotation of the reel, an improved bearing assembly on each carrier arm for its tine bar comprising:

a generally cylindrical housing secured to the arm against rotation relative thereto and having an annular wall projecting laterally outwardly from the arm generally in the axial direction of the tine bar,

said wall being axially aligned with the opening in the carrier arm and circumscribing the tine bar in radially outwardly spaced relation thereto;

a cylindrical bearing collar secured to the tine bar in surrounding relationship therewith for oscillating movement with the tine bar relative to the housing,

said collar being at least partially axially received within the housing in radially spaced relation to said wall thereof to define an annular region between the wall and the collar; and



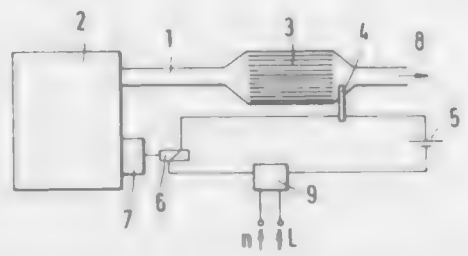
a bushing retained within said region against rotary movement relative to the housing and disposed in sliding engagement with the collar of the tine bar to support the latter during its oscillation.

5,007,236

REMOVABLE ROCKET MOTOR IGNITER

Robert I. Myers, New Hope; Bryce D. Brubaker, and Robert E. Overall, both of Huntsville, all of Ala., assignors to Morton Thiokol, Inc., Chicago, Ill.

Filed Oct. 26, 1987, Ser. No. 113,783
Int. Cl.[5] F02K 9/00
U.S. Cl. 60—256 17 Claims



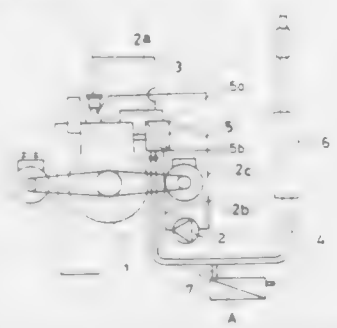
1. An igniter removably insertable in a rocket motor nozzle throat, the igniter comprises a sleeve having an axis and a generally cylindrical aperture means extending axially therethrough for insertion of an igniter tube therein, said sleeve comprises a body portion and a plurality of tab members extending axially from one end of said body portion and spaced apart circumferentially thereof, a first portion on each said tab member which extends radially outwardly such that a diameter defined by the plurality of said first tab member portions in combination is greater than a diameter of the nozzle throat, said tab members being composed of a material which allows said tab members to flex whereby said first tab member portions are movable radially inwardly so that said plurality of said first tab member portions may be inserted through the nozzle throat, said body portion having a diameter greater than a diameter of the nozzle throat, and the igniter further comprises an igniter tube containing ignition material which igniter tube is removably insertable in said sleeve aperture means and removably attachable to said sleeve, means for igniting said ignition material, and frangible means for effecting separation of said plurality of first tab member portions from said sleeve at a predetermined pressure in the rocket motor.

5,007,237

DIESEL INTERNAL COMBUSTION ENGINE WITH TEMPERATURE-DEPENDENT ADJUSTMENT OF START OF FUEL INJECTION

Eckart Müller, Gifhorn, Fed. Rep. of Germany, assignor to Volkswagen A.G., Wolfsburg, Fed. Rep. of Germany

Filed Jul. 27, 1989, Ser. No. 386,283
Claims priority, application Fed. Rep. of Germany, Aug. 23, 1988, 3828540
Int. Cl.[5] F01N 3/00; F02N 17/00
U.S. Cl. 60—285 3 Claims



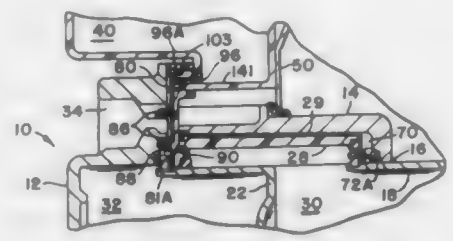
1. A diesel internal combustion engine having an arrangement for temperature-dependent adjustment of fuel injection start-up comprising catalyst means which is effective only for promoting oxidation of hydrocarbons in exhaust gas in an exhaust gas line of the engine at a temperature exceeding a start-up temperature, temperature sensor means for detecting the temperature of the catalyst means, and a control means for delaying fuel injection start-up only when the temperature sensor means detects a temperature that exceeds the start-up temperature of the catalyst means

5,007,238

APPARATUS FOR EVAPORATING CONDENSED LIQUID

Hideo Seko, Hashima, Japan, assignor to Aisin Seiki Kabushiki Kaisha, Kariya, Japan

Filed Jun. 23, 1989, Ser. No. 370,852
Claims priority, application Japan, Jun. 23, 1988, 63-083376[U]
Int. Cl.[5] F01N 3/02; H05B 3/02
U.S. Cl. 60—309 6 Claims



1. An apparatus for evaporating condensed liquid in a gas heat pump comprising:
a casing having therein a space;
a powdery ceramic material provided in the casing,
inlet means for guiding the condensed liquid into the casing, and
heating means for heating the condensed liquid within the casing

5,007,239
